**The Greenland Meteoric Iron.**—Not many metres from the spot on the shore at Ovisak where he found the large iron masses that were described in the *Academy*, Feb. 1 (vol. iii. p. 54), Nordenskjöld observed a rock, different in appearance and composition from the basalt of the cliffs, and enclosing iron not only in granules and spherular masses, but as a vein of the metal several inches wide, and several feet in length. An examination of the iron of this vein forms the subject of a paper by Wöhler in the *Nachrichten der Kön. Gesell. der Wiss. zu Göttingen*, No. 15 (15th May, 1872). The metal has the appearance of grey cast iron, has a bright metallic lustre, is very hard and quite unalterable in air, and has a specific gravity of 5.82. Nordenskjöld noticed that the metal of the larger masses, when heated, gave off a large quantity of gas; Wöhler finds that this iron evolves more than 100 times its volume of a gas which burns with a pale blue flame, and is carbonic oxide mixed with a little carbonic acid. It follows from this, writes Wöhler, that the iron contains a considerable quantity of carbon and a compound of oxygen, and that the metallic mass itself can at no time have been exposed to a high temperature. The iron by this treatment becomes much brighter than before, and is much more readily soluble in acid; but it still leaves a carbonaceous residue. A fragment heated in a current of hydrogen lost 11.09 per cent. of its weight: in other words, it contained that percentage of oxygen. Hydrochloric acid acts but slowly and partially on this metal, evolving first sulphuretted hydrogen, then hydrogen having the odour of a carburetted hydrogen, and deposits a black granular magnetic powder, which, though insoluble in cold acid, generates on the application of heat a gas with a strong odour of a hydrocarbon, and leaves a residue of amorphous sooty carbon and slightly lustrous graphitic particles. By treatment with iron perchloride, the metal dissolved without any evolution of gas, leaving a black residue of about 30 per cent., which, after having been dried at 200°, lost by subsequent ignition in hydrogen 19 per cent. of its weight, water being formed. It is now very readily attacked by hydrochloric acid, evolving sulphuretted hydrogen, and leaving a residue of nearly pure carbon, partly in powder, partly in graphitic scales. Iron and hydrogen chlorides therefore appear to dissolve the free metal only, and to have no effect on that in combination with oxygen and sulphur. The iron has the following ultimate percentage composition:—

Iron . . . . .	80.64
Nickel . . . . .	1.19
Cobalt . . . . .	0.49
Phosphorus . . . . .	0.15
Sulphur . . . . .	2.82
Carbon . . . . .	3.69
Oxygen . . . . .	11.09

100.05

As regards the question of the condition in which this large amount of oxygen is present in an apparently metallic mass, Wöhler is at present unable to arrive at a conclusion. From its homogeneous character and crystalline structure, it might be assumed to constitute a compound with iron as yet unknown, a diferrous oxide,  $\text{Fe}_2\text{O}$ , were it not that this view leaves no iron for combination with the sulphur and carbon. As, however, Nordenskjöld has found octahedra of magnetite in another Ovisak iron, Wöhler is disposed to regard the mass as a very intimate mixture of magnetite, of which there would be 40.2 per cent., with metallic iron, its sulphide, carbide, and phosphide, its alloys of nickel and cobalt, as well as some pure carbon in isolated particles. The latter undergoes no change when the magnetite and carbide by the action of heat generate carbonic oxide.

**Chinamine, a New Alkaloid in Cinchona succubra.**—Hesse, during an examination of cinchona bark from the Indian plantations, found a new body, to which he has given the name of chinamine (*Ber. Deut. Chem. Gesell. Berlin*, 1872, No. 6, 265). It is soluble in alcohol provided it be not dilute, and is rather readily taken up by ether, separating from its solutions in long white anhydrous prisms, resembling asbestos in appearance. The neutral sulphate crystallizes with difficulty in six-sided plates and short prisms. With chloride of gold, the solution of its hydrochlorate gives a yellow amorphous precipitate, which soon

becomes purple and deposits gold, the supernatant solution becoming purple, and afterwards brownish-red. Dilute solutions in acid exhibit no fluorescence whatever, nor does chinamine strike a green colour with chlorine and ammonia. It is barely bitter, but its solutions in acids have a rather bitter taste. It melts at 172° C., and unless kept for some minutes in a state of fusion crystallizes on cooling. The author hopes shortly to ascertain its elementary constitution.

**Amblygonite.**—Under the name of "Montebrasite," Moissenet and Des Cloizeaux last year described a new mineral species, occurring at Montebras, Creuse, and bearing in its physical characters a great resemblance to the amblygonite of Arnsdorf, near Penig, that Rammelsberg analysed in 1845. The mineral in each case is a fluophosphate of aluminium, lithium, and sodium, the French containing less than half the phosphoric acid and more than three times the fluorine of the German specimen. So great a disparity in composition being difficult to reconcile with Des Cloizeaux's observations of the perfect accordance, as regards crystalline form, cleavage, specific gravity, lustre, and hardness, of "montebrasite" with Rammelsberg's amblygonite, a further examination of the French mineral seemed desirable. This has been made by von Kobell, whose paper, read before the Bavarian Academy, is to be found in the *Jour. prakt. Chem.* 1872, Nos. 3 and 4, 112. His analysis of the Montebras mineral gave results that differed but slightly from those originally obtained by Rammelsberg with amblygonite. Within a few days of the publication of von Kobell's memoir at Munich, Rammelsberg read a paper in Berlin (*Ber. Deut. Chem. Gesell. Berlin*, 1872, No. 3, 78) on the same subject. His results correspond with those of von Kobell in all important respects, with the single and comparatively trifling exception that Rammelsberg finds the alkaline metal of the French specimen to be almost exclusively lithium. Von Kobell and Rammelsberg have consequently shown the mineral of Montebras to be amblygonite, and not a new mineral species. Although Des Cloizeaux noticed a difference in the mineral for the two localities as regards the dispersion of the optic axes, von Kobell contends that this feature alone, which has also been observed in mica and topaz, will not warrant us in regarding them as distinct minerals. Amblygonite, hitherto a rarity, occurs at Montebras in compact masses associated with wavellite and calaite in a bed of tin ore. Rammelsberg, since analysing the mineral a second time, believes its composition to be represented by the formula  $3(\text{Li}, \text{Na})\text{F} + 2\text{AlP}_2\text{O}_6$ . At a recent meeting of the Chemical Society of Paris (*Revue scientifique*, 27th April, 1872, 1049) it was stated by Pisani that some weeks before the publication of the papers of von Kobell and Rammelsberg he, in a note in the *Comptes rendus*, established the identity of the "montebrasite" of Moissenet with amblygonite.

**Diiodhydrin.**—This substance, the existence of which has hitherto been doubted, has been prepared by Nahmacher (*Ber. Deut. Chem. Gesell. Berlin*, No. 8, 13th May, 1872) by heating dichlorhydrin with potassium iodide in excess for from twelve to fourteen hours in closed tubes in a salt bath. The dark-coloured product is freed from the iodine which gives it this hue by shaking it with mercury or, what is still better, weak sulphuretted hydrogen water. It is a pale yellow oily body, having a specific gravity of 2.4, and forming at from -16° to -20° a white crystalline mass. Analysis gave numbers corresponding with the formula  $\text{C}_2\text{H}_4\text{I}_2\text{O}$ . It cannot be distilled without decomposition; a strong odour of acrolein is observed, and water, allylic alcohol, and allylic iodide pass over. The author also communicates the results of his investigation of the action of ammonia on dichlorhydrin and diiodhydrin.

**Sellaite.**—Strüver has recently published a paper, in the *Atti della R. Accad. di Torino*, on a colourless transparent mineral occurring with anhydrite at Geibroula, in Piedmont, and crystallizing in the quadratic system. Small fragments of this mineral melt in the flame of a candle; it is insoluble in water and acids, with the exception of sulphuric acid, which causes the evolution of hydrogen fluoride. The sulphuric acid solution contained 39.64 per cent. of magnesia, and the chemical and physical characters of this mineral led Strüver to consider it a magnesium fluoride analogous to fluor-spar in composition.

**Concentrated Ozone.**—By varying the form and construction of his ozone tubes, A. Houzeau (*Comptes rendus*, 74, 256) has devised an *ozoniseur* which, with a Ruhmkorff giving a spark from 2 to 3 centim. in length, yields ozone of a highly concentrated kind. He has no difficulty in producing oxygen containing from 60 to 120 milligrammes of ozone to the litre, according as the temperature is 15° or -30°, and he has since constructed an apparatus yielding 188 milligrammes of ozone to the litre.

### History.

Von Helfert's *History of Austria*. [*Geschichte Oesterreichs vom Ausgange des Wiener October-Aufstandes, 1848*. Von Joseph Alexander Freiherrn von Helfert. III.: Die Thronbesteigung des Kaisers Franz Joseph I.] Prag: Tempsky.

IN the preface to this (the third) volume of his *History of Austria*, Baron Helfert acknowledges that he has not given it to the world without a certain feeling of anxiety. Twenty-two years is a long period, but still it is not long enough to secure that perfect "objectivity" which, more than any other quality, is required of the historian. This is especially the case in Austria, where of the questions raised in 1848 so many still await their final answer. Some might add that our author, the son of a high-placed official before 1848, and himself under-secretary in the ministry of education when Count Leo Thun was minister, has been too much involved in political controversies for his impartiality to be considered above suspicion. And at the outset of this notice it may be observed that the work is to a certain extent that of an advocate. It is true that the author professes, and has doubtless endeavoured, to place himself in a position above considerations of party. But his own views, and those of the class with which he is connected, necessarily tinge the most conscientiously written narrative. The peculiar sources of information to which he has had access have contributed to this result. The Windischgrätz family placed at his disposal the papers left by the late Prince Alfred, the "Poliorecetes" of 1848. Like the Duke of Wellington, whom he resembled in a certain narrow-minded conservative conscientiousness, the prince seems to have kept copies of all papers of any importance that passed through his hands. His brother-in-law, Felix Schwarzenberg, on the other hand, left not a memorandum behind him; but the omission has been to some extent supplied by correspondence preserved by a member of that house, of one who was intimately associated with both the princes at the time when the ministry Schwarzenberg-Stadion was constituted. Besides these two important sources, Baron Helfert has received a number of private communications from actors or spectators in the drama which he relates. As several of his informants especially desired that their anonymity should be preserved, our author, not allowed to name all, does not name any of them, merely indicating the source and character of each contribution by such notices as "Privat-(Diplomatie)," "Privat-(Staatskanzlei)," and the like. It is amusing to observe how many of those contributed by members of the Austrian aristocracy are written in French. None of these private communications are derived from "liberal" sources either German or Hungarian, a fact in itself sufficiently significant.

With regard to the central event which has given its title to the volume, the abdication of Ferdinand and the accession of Francis Joseph, the author draws on his own experience, having been himself one of the chosen few admitted to witness the scene in the archbishop's palace at Olmütz. Naturally he dwells at great length on that event, its causes and consequences, and in so doing displays very conspicuously the peculiar artifice of his history—a certain trick of literary perspective whereby trifles in which the writer takes an interest are made to obscure events more important, but withal less agreeable to relate. For instance, the most important question with respect to the abdication of Ferdinand was its relation to the Hungarian constitution. But this question is dismissed by a statement that after Schwarzenberg had heard the opinion of Baron Jósika, formerly *Hofkanzler* for Transylvania, the only Hungarian statesman consulted on the point, the latter lost all credit in the eyes of the all-powerful minister-president. What opinion a transcendental cynic like Prince Felix had of a fellow aristocrat is a matter worth knowing; whether the Hungarian constitution was violated or not appears to a courtier and a bureaucrat to be too trifling to be discussed. In fact the parts relating to Hungarian affairs form perhaps the weakest portion of the book. Throughout the three volumes they are discussed in a narrow *incidental* way, which not only does not give the reader a broad general view of the controversy, but does not even afford him materials from which he might form a view of his own. The form in which the history is written, its slavish and inartistic adherence to chronological order, the way in which the author tries to fasten his reader's attention down to the details of revolutionary excesses and follies put before him, while he is as much as possible prevented from looking before and after, from contemplating the wretched obscurantism that existed until 1848, or the absolutist severity that prevailed as soon as the revolution had been crushed—all these literary devices not only throw suspicion on the "objectivity" claimed by the author in his preface, but they diminish the value of his work as a history. One of his principles—that of leaving out of consideration the future development and conduct of his *dramatis personae*—is avowed in the preface to his third volume, and explained as dictated by a feeling of delicacy towards living individuals. As a last peculiarity of method which diminishes the completeness of his history and consequently renders it often obscure is his theory, laid down in the preface to his second volume, that modern Austria begins not with the revolution of March 1848, but with the establishment of the ministry of Schwarzenberg-Stadion at the end of that year. This theory, apparently suggested by his dislike of the revolution, will commend itself to most minds as arbitrary and sophistical. It certainly has the effect of disturbing the natural order of his story, rendering a large part of the second volume an awkward introduction to the first.

The histories of the present day have been divided into historical romances and historical essays. Following this principle of classification, the book before us must be placed in the first division. When the author writes as a philosophical historian, he is generally vague and indefinite. This circumstance makes his second volume, in which he gives a general view of Europe in 1848, decidedly inferior to the first, wholly taken up as it is with the siege of Vienna by Prince Alfred Windischgrätz, and also to the third now before us. As a descriptive historian he has great merits, notably in his account of the bombardment of Vienna and of the desperate struggle in the Jägerzeil, as recounted in the first volume. He continually enlivens the narrative with details at once brilliant

and characteristic of the people he is describing. Who will not recognise the Austrian officers who complained, when the etiquette of the service required their attendance at the head-quarters of Windischgrätz, that there a stiffness prevailed "wie beim Maharadscha der drei Arabien?" He exhibits other qualities of an historical novelist in his full-length portraits of Prince Alfred Windischgrätz, Prince Felix Schwarzenberg, and Count Francis Stadion. We may decline to accept unreservedly his estimate of their characters and abilities, but at any rate he enables us to understand what manner of men these saviours of society were, at any rate as they appeared to intimate and friendly observers. And this in fact is the point of view from which the book may fairly be judged. It is an able, and—if we except a few occasional bursts of loyal invective—a moderate apology for the party which triumphed in 1849 and has since suffered so many reverses, stated by one whose experience and connections especially qualified him as its apologist. As such it will serve to guide and assist some future historian when the present heat of political controversy in Austria has subsided, but can hardly fulfil the fond expectations professed by the author, and be received by the world as the final impartial verdict of history. The time for judging the events of 1848-9 without anger or affection has, it would seem, not yet arrived.

ARTHUR J. PATTERSON.

#### THE HANSEATIC HISTORICAL SOCIETY.

IN Whitsun-week 1871, a new historical society was founded at Lübeck, for the purpose of combining once more all those cities which, in former ages, had been members of the German Hansa. According to a resolution passed at the time, invitations to join this purely literary resurrection of the famous old league were sent to no less than ninety-two towns, maritime and inland, and including those which long since have been separated from the body politic of Germany—the cities of Livonia and Esthonia, as well as of Holland. At the annual meeting which took place at Lübeck on the 21st and 22nd of May last, a very interesting report was brought up by the council. It states that thirty-eight of the cities have not only answered in the affirmative, but are willing to contribute, according to their means, an annual share to support the publications of the society. Considerable sums indeed will be forthcoming from Hamburg, Bremen, and Lübeck, from Cologne and Berlin, and from the principal towns of the Baltic and of Westphalia. Amsterdam, Harderwijk, Venloo, Deventer, Campen, Arnheim, and even diminutive Bolsward and Zutphen, have joined the new fraternity with sums in proportion to their respective importance. Eleven other places have expressed their thanks, and added their regret that they were not able to join in the same way; whilst the remaining forty-two have, up to this time, not thought it worth while to answer at all. Besides this civic membership, there is another individual one, which, since last year's meeting, has risen from ninety to about 120, a gathering of friends and students of mediæval history, government and city officials, keepers of record offices, professors of universities and high-schools, merchants, lawyers, artists, &c. An annual payment of two thalers will secure to each member a copy of the journal, the first annual number of which is to contain this year's report, and several important contributions to the history and the laws of the Hansa Confederation. During the meeting itself, a circumstantial account was communicated respecting the two chief works which have been taken in hand by the society. The first is to be an edition of the so-called *Recesses*, i.e. the transactions of the old Hanseatic parliaments, beginning with 1431, as the earlier ones down to that year are already in course of publication under the direction of the Munich Historical Commission.\* The editor of this first series will likewise superintend the new one, the chief labour being entrusted to two young scholars, natives of Livonia, and pupils of Professor Waitz, of Göttingen, Drs. Höhlbaum and von der Ropp. The most important materials for this col-

lection are extant in the archives of Prussia proper and the German provinces of Russia. The second work, which also will soon be begun, is a collection of such documents, charters, despatches, and letters, as have a more general bearing upon the history and administration of the Hanseatic League, and which for this reason cannot be printed in the more local collections issued by the special historical societies of Lübeck, Hamburg, Bremen, Brunswick, Stralsund, Cologne, &c. A third undertaking was unanimously adopted by the late gathering, viz. an edition of the oldest version or versions of the ancient Lübeck code of laws, to which public attention has been directed by an excellent paper of Professor Frensdorff, of Göttingen. Dr. Wehrmann, the principal archivist at Lübeck, then communicated to the society his researches on the origin of the ancient patrician families of that city, and their relations with and difference from the families of the nobility and gentry. Professor Mantels followed with a description of the ways and means by which the old Lübeck traders fetched relics of the saints from England (Canterbury) and from Venice, and Professor Pauli, of Göttingen, discussed the early use and the value of the word "Hansa" in English documents of the twelfth and thirteenth centuries. A visit was also made to the old archives, still kept in a lofty chapel of St. Mary's Church, called the "Threse" (Thesauraria), and the magnificent charters granted by the kings of England to the Hansa merchants, beginning with Henry III., besides many other documents referring to the Steelyard in London, were displayed and commented upon from various sides. It is not unlikely that our own Public Record Office and the Guildhall Records will soon be visited again by some collaborators of the new society, as the early share which the government and the commerce of England took in the propagation of the Hansa has not yet been adequately elucidated. A proper selection for publication amongst the great masses of documents bearing on the subject can never be made without repeated researches in the stores of such incomparable collections. The next annual gathering of the Hanseatic Historical Society will be held at Brunswick, in Whitsun-week 1873.

#### Contents of the Journals and Intelligence.

*Ephemeris Epigraphica*, part ii. (Berlin and Rome).—Wilmanns shows that the *praefectus castrorum* was the emperor's official, and served to keep in check the senatorial *legati* in command of the legions. Later, when every legion had its own camp, he became also the commander of the legions, the emperor's power having now annihilated that of the other orders in the state.—Bormann treats *de Aedificiorum Urbis Titulis*; and Mommsen continues his *Observationes Epigraphicae*, noting especially the erasure of the names of Diocletian and his colleagues, which was probably done by Constantine's orders.—Dittenberger gives some Attic inscriptions bearing on Roman history.

*Revue des deux Mondes*, May 15.—Coulanges describes "the German invasion in the fifth century," pointing out that its chiefs were really in the service of the empire, and that it was not, in the full sense of the term, a conquest. Of course the whole tone is sharpened by recent events.

*Bullettino dell' Istituto*, April.—Gives an inscription of L. Coiedius, who served in Claudius' expedition to Britain with the eighth legion; and one referring to a German king, Aistomodius (?="battle-mood"), found at Carnuntum, near Vienna.—The account of the excavations at Certosa is continued; and an inscription given containing names of Athenian prytaneis of A.D. 126-127, which shows that the old Council of 500 had been restored (it had been 600), or rather that it had been made 507, i.e. thirty-nine prytaneis for each of the thirteen tribes which then existed.—Some inscriptions on sling bullets follow.

*Gött. gel. Anzeigen*, March 13.—Contains a good critique of the present science of statistics. It is shown that the mere figures prove nothing unless the whole inner life of each state is taken into account, which alone can explain and account for its various manifestations.—March 20.—Praises the new *Dictionary of the Low German Dialects* (middle period), by Schiller and Lübken, which is of much interest for English etymology also.—The article on the *Neοελληνικά 'Ανδλεκτα* discusses the question of rhyme in the Romaic ballads, and especially refers to the article in our thirty-fifth number (vol. ii. p. 508). A notice of Buchner's *Aus den Papieren der Weidmann'schen Buchhandlung* points out how an account of this great publishing house throws light on the history of German literature at the end of the last century—much as a history of our own great publishing firms would do on English literary life. Buchner gives many letters.—March 27.—Goedeke adds some fresh information to that contained in Ranke's *Die deutsche*

\* See *Academy*, No. 27 (vol. ii. p. 339).

*Mächte und der Fürstenbund.*—April 3.—Brandes analyses the *Ideale und Irrthümer* of Karl Hase (the well-known church historian), who was one of the students who kept alive the idea of German unity in the evil times after the Congress of Vienna, when the kings broke their promise of giving free institutions to the people which had shown such devotion in the War of Liberation against Napoleon. Hase was one of those who suffered imprisonment.—Pitré's *Le Lettere, le Scienze e le Arti in Sicilia negli anni 1870-1* shows the wonderful revival of literature in the South since Garibaldi once more called Sicily to life.—April 10.—Notices Lübolf's essay on the Christian missionaries in Switzerland before St. Gall, especially St. Beatus, perhaps also of Celtic origin.—April 17.—A notice of Goltz's *Die ländliche Arbeiterfrage und ihre Lösung* is specially interesting just now. The solution of the difficulty depends, in the reviewer's belief, on our giving a greater security to the labourer's position, a permanent home leading to a higher standard in morality, education of children, &c.—Hübner's *Sixte Quinze* is reviewed and stress laid on Sixte's views as being those of the Franciscan section of the church as opposed to the Dominican and Jesuit views and to Philip II.'s schemes.—May 8.—Reviews Rossbach's *Römische Hochzeits- und Ehedenkmäler*, and Koehne's *Tempel d. capitolin. Jupiter*; the last to explain the difficulties connected with the architecture.—Waitz discusses the original authorities for the story of the Maid of Orleans; and Liebrecht a life of Il Conte di Prades as illustrating the constitutional history of Sicily.—May 15.—Analyses Eschenloer's *History of Breslau*, one of the contemporary narratives which the Society of Silesia is publishing, and which illustrate the Hussite movements and the commencement of the Thirty Years' War.—An analysis follows of Könnike's narrative of his suspension by the Bishop of Paderborn; a good illustration of the absolute power of the bishops.—The conclusion, too, of Rogière's *Recueil général des Formules usitées dans l'Empire des Francs du VIème au XIème Siècle* is criticized by Waitz.

*Revue des Questions Historiques* (Rom. Cath.), April.—Has an article illustrating the constitution of Gaul under the Romans (50 to 27 B.C.), from lately discovered coins and inscriptions; and another on the death of Henri IV.'s mistress Gabrielle d'Estrees, as described in a contemporary letter; stress is also laid on the way in which Sully interpolated, or in fact re-wrote, some of the letters inserted in his narrative.—A document on the seizure of Boniface VIII. at Anagni (from the British Museum) follows, and Masson reviews the third volume of Haddan and Stubbs' *Councils and Ecclesiastical Documents relating to Great Britain and Ireland*.

Von Sybel's *Historische Zeitschrift*, 1872, part ii.—An article on St. John of Nepomuck (whom Wenceslaw threw into the Moldau at Prague—because of his relations with the queen as her confessor, according to the popular story) traces the historical origin and growth of the legend.—A very full account follows of the negotiations of Kaunitz with France and Russia which brought about the Seven Years' War.—An article on the "German Territory towards the End of the Eleventh Century" shows the nature of the German kingly power in early times, before it became associated with fixed territorial possessions, and so a source of dissension, whereas originally it had been the means of unity.

Dr. Potthast, the Custos of the Berlin Library, and author of the *Bibliotheca Historica Medii Aevi*, will shortly publish the *Regesta Pontificum Romanorum* from 1198-1304, in continuation of Jaffé's well-known work, up to the migration of the Popes to Avignon. No less than 30,000 documents have been excerpted by this indefatigable scholar; 6000 relating to Innocent III. alone, whilst Delisle's elaborate collections contained only 3000 bearing on this pope. It has been awarded a double prize by the Berlin Academy of Science.

### Philology.

Thucydides I. With Collation of the Two Cambridge MSS. and the Aldine and the Juntine Editions. By Richard Shilleto, M.A., Fellow of Peterhouse, Cambridge. Bell and Daldy.

IN giving to the long expectant public a small part of a work promised, as Mr. Shilleto admits, nearly nine years ago, and contemplated, perhaps commenced, nearly three times that number of years from the present, the editor makes some apologies, which his many literary friends and admirers will read with regret, on the score of over-tasked energies and repeated attacks of bodily ailments. The portion now published bears some marks of being an unfinished and fragmentary performance. There is no preface, properly so called, a very scanty index of a page and a half, and, generally, an avoidance of the many literary topics surrounding the greatest work, perhaps, of the greatest period of Greek literature. These, or some of these, we may perhaps yet hope to see discussed. Meanwhile, as a contribution to verbal and grammatical scholarship, rather than from any special critical novelties or improvements in the text, this work will be accepted with gratitude and thoughtful attention by those who, few in number though they may be, adhere to the school of Porson and Dobree, or of their modern German representative, Cobet.

Mr. Shilleto speaks of his collation of the two Cambridge MSS. which he has consulted in terms rather exaggerating the real labour and time required. A month or three weeks would complete the most accurate and painstaking collation of a single book, where only two MSS. were to be examined, provided, of course, that they were not particularly difficult to decipher. We do not find that any gleanings of special importance have been derived from these two MSS., both of which have been before collated by Arnold and others. But the Clarendon MS., which is known as N, seems one of the best; and it is at least a satisfaction to have before us so very perfect a collation as Mr. Shilleto has given us. He considers the writer of it to be the same as the transcriber of the famous Sancroft MS. of Herodotus, preserved in Emmanuel College Library at Cambridge. This latter MS., which is beautifully written on fine glossy paper, Gaisford and Blakesley assign to the twelfth century, Mr. Shilleto to the fifteenth. It is singular that a difference of *four* centuries should occur in the estimate of such eminent scholars! In the opinion of the present writer, who has often seen it, the Sancroft MS. belongs to the earlier period of the fourteenth century.

It is to be feared that Mr. Shilleto has spent a good deal of labour to but little purpose, in his collation of the Junta edition of 1526. It is evidently a mere reprint of the Aldine, with just here and there a slight correction introduced; but there is not the slightest appearance of any other MS. having been employed.

The critical notes in this edition are couched in terse and often abbreviated Latin; the exegetical notes are in English. Both are, occasionally, we will not say desultory, but ranging off into questions of minute scholarship not very directly bearing on the text of Thucydides. The impression therefore left on the reader is rather that of an overflowing mind drawing freely on its stores in the cause of general scholarship, than of a strict interpretation, such as Poppo has given, of the author's meaning, or the simple notation of readings such as that accompanying Dr. Arnold's text. In

truth, Mr. Shilleto's work is a reaction from the more generally philological character of Arnold's edition, viz. one in which questions of history, geography, and antiquity were freely and genially discussed, and a return to the kind of scholarship from which Arnold's book was itself a reaction, that hard and dry critical and grammatical ἀκρίβεια that constituted the discipline under which most of our eminent classical scholars were trained. In the art of translation Arnold stands paramount; he was not invariably very accurate, but then he had a most happy knack of giving, in beautiful and appropriate English, both the sense and the spirit of the most difficult and entangled parts of the speeches. Mr. Shilleto does not in general translate more than a sentence, and here and there a little more elegance of expression might have been desired. For instance, in chap. xx. the words—τὰ μὲν οὖν παλαιὰ τοιαῦτα εἶρον, χαλεπὰ δὲ παντὶ ἐξῆς τεκμηρίω πιστεύσαι, Mr. Shilleto renders, "Such have I found older events to be, albeit difficult for one, hardly allowing one, to give credit to every link in the chain of argument." This does not read quite neatly; and is not τεκμηρίω rather the ablative than the dative, "though hard to believe in *by* each consecutive proof"? We might wish Mr. Shilleto had said something here on the singular fact, that such a writer as Thucydides, who as late as B.C. 400 was taking every possible pains to investigate early Grecian history, nowhere refers (except once, we believe, in i. 97, to Hellanicus) to any written literature, but always speaks of ἀκοή, "hearsay," and personal research and enquiry. How can this fact be explained, if the common opinions about the antiquity of a Greek literature are true? In his note on chap. xx. Mr. Shilleto admits that "it may be questioned whether Thucydides alludes to Herodotus at all." But to return to ablative *versus* dative; in chap. xxv. Κορινθίω ἀνδρὶ προκαταρχόμενοι τῶν ἱερῶν, Mr. Shilleto translates, "in compliment to a Corinthian commencing the initiatory parts of the sacrifice of victims." Rather, one would suggest, "beginning the sacrifices *by* (or *with*) a Corinthian." Just below, ναυτικῶ δὲ καὶ πολὺ προέχειν ἔστιν ὅτε ἐπαιρόμενοι, Mr. Shilleto gives us a somewhat slipshod version as the literal meaning, "lifting themselves up that they were," or "lifting up their voice that they were" (superior in naval force). It is simply "elated by the *idea* that they were," &c., ἐπαιρόμενοι meaning δοκούντες, νομίζοντες, with a notion of conceit and self-confidence.

There is a difficult passage in chap. xxxiii., where the editors have not generally seen that we should read καταθήσεσθε, and so have been puzzled between the corrupt readings ὡς ἂν μάλιστα καταθήσθε and κατέθησθε. The future follows the preceding ποιήσεσθε, and the sense is thus quite simple; "you will store up for yourselves our gratitude, with as lasting a testimony of it as men can possibly have." The ellipse after ὡς ἂν, viz. of δράσειαν or some similar optative, is far from uncommon. Mr. Shilleto translates, "you will have an advantage by having received us in our greatest peril, to the end that you (if you receive us) may bestow the obligation with the most certain and never forgotten evidence."

In chap. lxi. Mr. Shilleto gives his high sanction to the (as I think) more than questionable doctrine that χρῆν, ἐχρῆν, χρῆναι, χρεῖν, &c., which have the regular inflections of an impersonal verb, are contractions for χρῆ ἦν, χρῆ ἔδει, &c., where he regards χρῆ as an indeclinable noun, like θέμις. He says ἐχρῆν is formed on a false analogy; a proposition no one is bound to accept on the evidence of a very doubtful passage in Soph. *Oed. Col.* 504, where χρῆσται is supposed to stand for χρῆ ἔσται. Probably χρεῶν is a neuter adjective, and not a corruption of χρῆ ὄν at all. Compare πλέως, and the nouns χρεῶν and χρέως.

Another doubtful doctrine is that αἶρων in chap. xc. may be an aorist. "There might," he says, "be an aorist ἦρα [*sic*] and so a subjunctive αἶρω." But ἦρα, if a possible form, would become ἦρα, and αἶρων αἶρων, so that this would be a return to the now generally rejected cacography ἔφην for the aorist of φαίω. The epic aorist ἦρα is formed regularly from αἶρω. The passage in the text, on which Mr. Shilleto has a long note, ἐπισχεῖν μέχρι τοσούτου ἔως ἂν τὸ τεῖχος ἱκανὸν αἶρων, is really a confusion between two different constructions, ἔως αἶρων, "whilst they are raising," and ἔως ἂν αἶρων, "till they shall have raised."

In chap. cxx. ὅσοι Ἀθηναῖοι ἤδη ἐνηλλάγησαν can only mean, "who have had dealings with the Athenians." It is a strange phrase, no doubt, for ἐν ἀλλαγῇ ἐγένοντο. (Madvig's correction, ἐν ἀλλαγῇ ἦσαν, is a perfectly obvious one, and was long ago made by the writer of this article.) Mr. Shilleto says the verb "seems to convey no meaning except *permutati sunt, mutati sunt invicem*." We must not always be the slaves of examples, especially in the use of verbs acknowledged to be of rare occurrence.

In chap. xviii. δυνάμει ταῦτα μέγιστα διεφάνη, the meaning seems to be διέπερε, "were seen to be the greatest in power among all the rest." Mr. Shilleto says, "were found on trial, when put to the test." Compare διεφάνησαν in vi. 17. In chap. xiii. τριήρεις (λέγονται) πρῶτον ἐν Κορίνθῳ ἐναντιοπληθύναι, 'the ἐν is simply repeated, and perhaps, indeed (as one good MS. has πρῶτο), it should be omitted before Κορίνθῳ. Anyhow, it does not seem clear how "the preposition added to the verb gives additional strength."

In chap. xci. Mr. Shilleto proposes αἰτοσιπῶν δὲ ἄλλων ἀφικνουμένων, objecting to the article in the vulgate, τῶν δὲ ἄλλων ἀφικνουμένων. This seems only an example of that brachylogy so common with the Greeks—"when the others kept coming (who took a serious interest in the matter)," &c. Ingenious as αἰτοσιπῶν may be, it hardly reads well immediately after αἰτοῦ, and at least cannot be considered a necessary alteration. Thus we are not driven to the strait in which Mr. Shilleto finds himself placed, because "τῶν ἄλλων cannot be used for ἄλλων."

Some few further points might be criticized; but scholars will prefer to give this book, as a whole, what it well deserves, a careful and thoughtful perusal throughout, and they will rise better scholars than when they sat down to it.

F. A. PALEY.

La Roche's *Iliad*. [*Homer's Iliad*, für den Schulgebrauch erklärt von J. La Roche.] Berlin: 1870-71.

THE *Iliad* of Professor La Roche appears in a form which does not do justice to its great merits. It professes to be an edition for the use of schools: there is therefore no complete *apparatus criticus*, like that of his *Odyssey*, nor is there any exhaustive discussion of difficult passages. Yet the textual criticism of Homer is materially advanced by the work. Besides making full use of his previous researches (published in his *Text, Zeichen und Scholien des berühmten Codex Venetus*, Wiesbaden, 1862; *Die Homerische Textkritik im Alterthum*, Leipzig, 1866), Professor La Roche has now collated for the first time several other MSS. of great importance, and incorporated the results in this edition. The collations, however, are not given in full: and those who use Professor La Roche's *Iliad* may be at a loss for the key to his mode of referring to his MSS. Such a key, it may be worth while saying by the way, is to be found in the preface to the *Homerische Untersuchungen*, p. v, and in the edition of Professor Ameis, part 2 of the appendix, p. 2. The chief new materials are: the second Venetian MS. and two Florentine MSS., both of considerable value. Two Vienna MSS. (*Vindob.* No. 5 and No. 39), a Stuttgart MS., and two

other Venetian MSS. are of minor importance. The result is, not indeed a critical edition of the *Iliad*, but an improved text, and a valuable contribution to the edition of the future.

In the field of interpretation, Professor La Roche has distinguished himself by a series of researches into the grammar and prosody of Homer, of which the *Homerische Untersuchungen* form only a part. The chief fruits of his conscientious and scholarly labour are embodied in the notes to this edition. In this case, too, the form which he has been led to adopt is unattractive and somewhat inconvenient. If the scholars of the Austrian gymnasia look out all the parallel passages to which references are given, they will certainly learn a great deal about Homer, and learn it on a very sound method; but we fear that in this country at least few have sufficient patience for the task. It must be added that the book is not very carefully printed. Many of the references—usually of so much value—are made comparatively worthless by a wrong figure. Among other misprints not corrected in the tables of errata may be noticed: i. 66 (note), M for Π; ii. 812 (note), ἀνάνευθε for ἀπάνευθε; iii. 296 (note), ψ 220 for Ψ 220; iv. 421 (note), Δ 117 for Λ 117; vi. 119 (note), 876 for B 876; ix. 456 (note), "Ver-muthungen" for "Verwünschungen"; ix. 601 (text), κᾰκιον for χαλεπὸν (i.e. the vulgate is condemned in the commentary, but retained in the text); xi. 419 (note), ἐσσεύαντο for ἐσσεύοντο; xii. 37 (text), μάστιγα for μάστιγι. In one or two places (i. 112, v. 478, vii. 64) the appendix is referred to, but no corresponding note is found there. At i. 87, εἰσι is called a plural, doubtless by an oversight. We cannot agree with Professor La Roche in scanning vii. 88,

νῆ πολυκλήϊδι πλεῶν ἐπὶ ὄνοπα πόντον.

It is to be hoped that Professor La Roche will not merely have ample opportunity in future editions of correcting the printing of his *Iliad*, but that he will enlarge the plan on which it is composed. No one knows better the value of the materials which, as we learn from him, lie still unused and almost forgotten at Florence, in the Escurial, and in more than one English library.\*

D. B. MONRO.

#### THE PHILOLOGICAL CONGRESS AT LEIPZIG.

THE twenty-eighth *Philologenversammlung* took place at Leipzig on the days from the 22nd to the 25th May, and deserves notice in more than one respect. As has been observed in a previous report on the Congress at Kiel (*Academy*, vol. i. p. 59), "the utility of such a meeting is not to be measured by its Transactions," though we believe that this year's *Transactions* (to be published by Messrs. Teubner) will not be inferior to any one of the records of the doings of former meetings; but this time the quickening influence of a large social gathering and mutual exchange of ideas seems to have been realised to a greater extent than ever before. The number of philologists registered at the *Empfangsbureau* amounted, on the third day, to no less than 923, thus nearly doubling the number of the Kiel meeting, then stated by your correspondent to have been more successful than any previous gathering. It would be easy to pick out a long list of names respected and honoured throughout Europe, but it suffices to remind your readers of the fact that Leipzig itself, as it were the centre of the philological life of Germany (the glory of Bonn having, alas! past away for the time being), contains among its professors men of such world-wide fame as G. Curtius, F. Zarncke (the editor of the *Literarische Centralblatt*), Fleischer (the famous Orientalist), and J. A. Overbeck. To these it would be fit to add the equally famous name of F. Ritschl, the *alter sospitator Plauti*, had not

this scholar (for reasons which you will allow me to pass over) thought proper to abstain from participation in the meetings, though he did put in an appearance on Tuesday evening, when the newly arrived guests met for the first time in the splendid hall of the *Schützenhaus*, to shake hands and renew old acquaintances. Professor Ritschl had been chosen president in 1869 at Kiel, but when 1870 and 1871 had changed the political aspect of things so much, Ritschl withdrew from this office, and his place was filled by Professor G. Curtius, with the greatest tact and, it should be added, occasionally under very trying circumstances. The opening speech delivered by this illustrious scholar dwelt, as was unavoidable under the present bias of national feeling in Germany, on the great events which had caused the repeated postponement of the meeting from 1870 to 1871 and 1872, and he endeavoured to trace the connection of philological pursuits with the development of national spirit and patriotism. The second part of this speech was specially devoted to the illustration of the growth of Philology itself, when the speaker entered into his favourite subject of the bearing of Comparative upon Classical Philology. The first paper was by the president's brother, E. Curtius (the historian), who gave an interesting account of recent discoveries at Pergamon, together with a sketch of the history of the city. Though one of the earliest towns in Asia Minor, it is not noticed by any writer before Xenophon, and most of the ruins belong to the time of the dynasty of Attalus. It was observed that after the English and French explorers of Asia Minor, Germany was at last beginning to take part in these discoveries, and many of the members were no doubt startled by the communication that our famous Moltke had previously gained laurels in the peaceful task of exploring Asiatic cities and regions. Of great interest were two recently discovered inscriptions, the one of which contains a long list of the names of *Ephēbes*, showing that this institution was not confined to Greece proper, but had also made its way to the outlying posts of Greek civilisation.

Among the papers of the second and third day, the foremost place is no doubt due to an excellent and lucid paper by Professor Delbrück, of Jena, on the results of Comparative Syntax. After showing that the syntactical peculiarities of the Vedas greatly resemble those of Homer, it was observed that the finite verb, though best developed in Greek, would appear to have existed in its main features in the original speech of the Aryans, and instances were given of the late origin of a conditional tense in Sanskrit and Greek. It was admitted that the study of the Asiatic languages was the best way of learning to admire the simplicity and neatness of the Greek syntax. The main difference of Sanskrit and Greek was then found in the treatment of the *verbum infinitum*, and the construction of the accusative with the infinitive was stated to be peculiar to the classical languages. All secondary clauses were then proved to have been originally primary and independent sentences, which was illustrated by the peculiar treatment of *oratio obliqua* in Sanskrit and Greek. The early Aryan speech appears to have been destitute of a relative pronoun, and it was maintained that the root *yá* in Sanskrit had originally only an "anaphoric" sense. The question as to the origin of hypothetical sentences was designated doubtful, though it appeared probable that the *ei* of the Greeks was derived from a root with a demonstrative meaning. This instructive paper was followed by some equally interesting observations of Professor Lange, who laid great stress on the necessity of a scientific syntax of the Homeric language, and while allowing the merits of the well-known work of K. W. Krüger, still contested the standpoint of the writer, which was no longer in harmony with the progress of modern Comparative Philology.

After a somewhat tedious paper of Dr. Trieber on the *τελη* of the Spartans (which were identified with the Ephori, but distinguished from the general expression *οἱ ἐν τέλει*), the next paper was read by Director Hasper, of Glogau, on the scene of the *Iliad*. The speaker was opposed to the assumption that Homer's Ilios lay on the same spot as the Ilion of a later age, and inveighed against the futile attempts of the notorious Herr Schliemann to discover the site of Troy in agreement with the tradition of the contemporaries of Alexander the Great. Accurate and elaborate as Dr. Hasper's paper was, we are inclined to attach far greater weight to the excellent observations, subsequently made by Professor W. Clemm, of Giessen, who justly questioned the possibility of deriving direct geographical state-

\* Since these lines were written, the first part of Professor La Roche's critical edition has been announced as soon to appear. It is to be based, like the present text, chiefly on the two manuscripts Venetus A and Laurentianus Plut. xxxii. 15 (Hoffmann's Laur. B). The *apparatus criticus* will contain the variations of four others collated by Professor La Roche, besides Eustathius and the fragments.

ments from such a poem as the *Iliad*, whose author should not be treated as a careful writer of military events, but as a poet frequently carried away by his imagination, and whose exactness in geographical details should not be insisted on too much. Director Stier made some observations on Homer's Scamandros, which he identified with the modern Mendré.

Another highly interesting paper was Professor A. Schöne's essay on Greek reliefs, chiefly in connection with inscriptions. The professor has a work on this part of archaeological study nearly ready for publication (copies of which were shown to the meeting), and it may be hoped that his lecture will cause many scholars to study these works, which go far to acquaint us with the various phases of ancient Greek life.

Dr. Müller's elaborate essay on Plotinus could not be heard in full on account of the shortness of the time of the third day, and in the same way the Rev. Mr. Whitford's proposal to form a committee for the framing of a universal linguistic alphabet was dismissed without discussion. Dr. Tischendorf distributed specimens of a new Greek type, imitated from the MSS. of the eighth and ninth centuries.

Among the various Sections the transactions of that on Education were of special importance. It may be stated that the proposal of removing the free Latin Essay (which now forms part of the final examination at German colleges, *Maturitätspriifung*) was rejected with a great majority, the meeting being of opinion that the power of writing a free Latin composition was, so to say, the central point and test of the classical training of this country. An animated discussion was caused by the spirited and energetic lecture delivered by Director Kruse (of Greifswald), concerning the charges brought against the German colleges, that their peculiar course of studies was onerous and hurtful to the mental and bodily development of the students. Without denying the justice of these charges in but too many cases, the meeting seemed to be of opinion that such perverse results were the consequence of individual faults both of masters and pupils, but not of the existing laws on the degree of knowledge to be attained, though much blame appeared to fall on many of the Prussian *Schulräthe*, who exaggerate their demands to a degree sometimes quite preposterous. Instances of this perversity, which would be amusing if they were not so very sad at the same time, were produced in regard to the exorbitant amount of knowledge chiefly insisted on in a branch of instruction which ought to be excluded from examination altogether, we mean religion. It is to be desired that this discussion will exercise some influence on the Prussian authorities (represented at the meeting by Geh.-R. Wiese) in framing the new law on the Examinations which is said to be shortly forthcoming.

The most interesting features of the Archaeological Section were the explanation of an elaborate plan of the battle of Cannae by Herr Schillbach, of Potsdam, and the exhibition of a large number of coins in the collection of Herr Imhoof, of Winterthur. In the German and Romance Section elaborate papers were read on the laws of *Auslaut* in the Lithuanian, Slavonic, and Gothic languages, by Dr. Leskien; on the German oases in the non-Germanic countries of the Austro-Hungarian monarchy, by Professor Schröer, of Vienna; and especially a capital, and in parts very witty, paper by Professor Hildebrand (one of the editors of the continuation of Grimm's *Dictionary*), on the identification of possessor and possession in popular speech, or, as the author himself entitled it, *über Land und Leute*. There were also papers by Dr. Schuchardt (the author of the well-known work on Vulgar Latin), on some syntactical modifications of initial consonants in the Dialects of the Centre and South of Italy; and by Professor Gröber on a hitherto unknown branch of the *Chanson de geste Fierabras*. The Section for Modern Languages (which was first formed at this meeting, but at once amounted to no less than fifty-eight members) offered a very valuable paper by Dr. Mahn (well-known to the possessors of the latest edition of Webster), on the Iberian element in the Romance languages; but as it chiefly consisted in a number of etymologies, it would be difficult to give an abstract of this lecture. Dr. Schmidt, of Falkenberg, lectured on the pedagogic value of English syntax, a position, as it seems to us, very difficult to prove. It should finally be added that the Oriental Section occupied themselves with a lecture by Professor Sachau, of Vienna, concerning the historian Al Biruni\* and a

proposed edition of his works, and another by Professor Brugsch on some hieratic papyri of the museum at Bulak, containing Egyptian rules on the practical conduct of life. Another lecture by the same scholar, on the present state of instruction in Egypt, was not given, owing to his sudden departure. You will excuse my not saying anything on the Mathematical Section; but let a reporter try to be ubiquitous as much as possible, he must sacrifice some parts of the transactions of a congress combining so many various elements as the Philological Congress at Leipzig undoubtedly did.

Hitherto only one side of the Transactions has been sketched; we have to add a few words on the social aspect of the Congress. The arrangements were excellent; the great dinner on the 22nd splendid, the toasts numerous, the convivial enjoyment loud and undisguised, though never boisterous; the wine abundant and prime. On the 24th an express train conveyed the philologists to Grimma, where the city of Leipzig had provided an excellent entertainment at the Gattersburg, on the romantic banks of the river Mulde, and where the beautiful walks in the surrounding woods were visited by large troops of philological excursionists. Capital also was the performance of Beethoven's *Fidelio* at the new *Stadttheater*, which is in itself worth seeing, and which was placed at the service of the philologists by the manager. In fact, it may be added that everybody at Leipzig did their best to welcome their philological guests, many of the citizens having placed rooms at the disposal of the committee, and all sights being thrown open to the visitors. Surely all who were present at this year's meeting will have left Leipzig with the feeling of content and gratitude which was eloquently expressed at the close of the meetings on Saturday by Director Classen, of Hamburg, one of the oldest members of the Congress.

In selecting the place of the next meeting the assembly were led by political and national motives. In this new empire of ours we feel that there is still one brother left outside whom we should be sorry to lose—a feeling enthusiastically expressed in the reception given to an Austrian speaker. The German element in Austria stands in need of any support and countenance that can be afforded to it; and owing to this it was resolved to meet next year at Innsbruck, in the Tyrol, whence a kind and pressing invitation had been sent. Professor Jülg, of Innsbruck, cordially accepted the resolution in the name of his town; and thus we parted to return to the duties of our work, which had been most pleasantly broken by the Congress, of which I have endeavoured to give you a short sketch.

W. WAGNER.

#### NEW PHILOLOGICAL PERIODICAL.

WE have too long delayed giving an account of a new periodical which promises to be of great importance to classical philology. The *Ephemeris Epigraphica*, of which the first number appeared at the beginning of the year, is intended to appear four times a year as a perpetual and growing supplement to the *Corpus of Latin Inscriptions*. Instead of being scattered here and there in the various philological journals, and buried under a heap of other matter, all newly found inscriptions will be inserted in its pages under the direction substantially of the same editors as those of the *Corpus*. But inasmuch as the greatest number of new discoveries are made in Rome itself or its neighbourhood, the projectors of the undertaking have done wisely in attaching it rather to the Roman Institute of Archaeology than to the Berlin Academy. The *Bullettino* and *Annali* of the Institute are already known to scholars in this department of learning as the least imperfect repertory of such matters. Nor is it a slight benefit that by this means the editors of the *Corpus* associate with themselves the honoured name of De Rossi.

The usefulness of such a work is self-evident, and we cordially recommend it to our readers' support. English scholars should be urged to communicate to Professor Mommsen in Berlin or Professor Henzen in Rome any new discoveries that may come under their notice either here or elsewhere. Communications may be made in Latin, which is to be the language of the *Ephemeris*, but they will be readily translated by the editors from any modern language. The importance of a single isolated inscription is seldom apparent, though, when compared and co-ordinated with others in the hands of an expert, it may be made to give very telling and decisive evidence. The science of inscriptions is almost as conclusive in its method and results as that of comparative anatomy. A single fragment will often be

\* See *Academy*, vol. 8. p. 506.

enough to restore at least the general outlines of a comparatively long document, and to determine its date and circumstances.

Only for the perfection of such a science it is necessary that all facts bearing upon it should be immediately made known to all who have an interest in it, that they should be systematically classified and rendered easy of reference, after undergoing a thorough sifting and testing process. The *Ephemeris* will, it is hoped, make the fulfilment of these three conditions possible, supplying: 1. Immediate information; 2. Scientific examination; 3. Systematic arrangement. The final arrangement will not and cannot take place at once, but will be delayed till the time when it is thought fit to issue regular supplementary volumes of the *Corpus*. Of this at present three parts alone are published: I. The most ancient, containing inscriptions up to the death of Julius Caesar; II. Those from Spain; and IV. The Pompeian wall-inscriptions. The first number of the *Ephemeris* contains additions to all of these, as well as dissertations on certain kindred subjects. The supplements to the first volume consist chiefly of writings on works of art, cups, chests, and mirrors, especially from Praeneste and of names from the sepulchres of the same place. It may be a new fact to our readers (though noticed some years ago in the journals of the Institute) that the words on the Cista Ficorioniana are to be read *Dindia Macolnia fileai dedit*, not, as was always read before, *filea*.

The form *Jovos* for *Jupiter*, on a chest also from Praeneste, and the name *Vibis Pilipus*, i.e. *Vibius Philippus*, on an early mirror from the same place, are remarkable. In the additions to the *Fasti Anni Juliani* we notice the remark that the name *Juturna* should be rather *Diuurna* (p. 36), another instance of *Fidi* for the dative case (p. 39), a substantiation of the name *Juno curritis* = *quiritis*, and a reference to a sacrifice to *Feronia*, till now regarded as a purely Latin, not a Roman goddess (p. 41). Among the Spanish we remark especially the *tessera hospitalis*, described and commented on in *Hermes*, vol. v. The Pompeian supplements are but few; but we observe that Herr Zangemeister accepts as a better reading than his own the distich given in the *Academy* of September 15, 1871 (vol. ii. p. 444), *Quoi scripsi semel*, &c., from an early copy by the Bishop of Lincoln.

The rest of the number contains four sets of *Observationes Epigraphicae*, by Professor Mommsen. The first is an explanation of the epigram *Ursus togatus vitrea qui primus pila* (Orelli, 2591), in which he shows that *togatus* is probably not a proper name, but means simply "Roman," and that *Ursus* was not a freedman. The second is a genealogy of the Junii Silani, and explains their relation to the imperial family. The third, *de fide Leonardi Gutenstenii*, is a curious and useful paper on the frauds of the early editors of inscriptions. The fourth contains some grammatical notes *ex actis Arvalium*, and proves, for instance, that *conlega*, *conlegium* were the forms in use up to A.D. 32, and that afterwards *collega*, *collegium* came into use except during the reign of the antiquarian Claudius. The second number, recently published, contains no additions to the *Corpus*, but some interesting papers and discussion. G. Wilmanns traces the history of the *Praefectus castrorum* and *Praefectus legionis* in connection with the establishment of a purely military power. W. Dittenberger discusses some Attic *tituli ad res Romanas spectantes*. E. Bormann emends and combines fragments of three inscriptions on public buildings in Rome, the first of which is important. Lastly, Professor Mommsen continues his *Observationes Epigraphicae* with his usual acuteness and wide experience.

J. WORDSWORTH.

### Contents of the Journals and Intelligence.

The Indian Antiquary, part v. (May).—Sketches of Mathurā; by F. S. Growse. [Continued; accounts of the twelve *Bans* (*vanas*) or forests, mentioned in the *Mathurā-mahātmya*, and connected with Paurānic legends; also of the twenty four *upabans* which are said to refer mainly to Rādhā's adventures, and to have no ancient authority whatever.]—On the Treatment of Oxytone Nominal Bases in Sanskrit and its Derivatives; by J. Beames. [Sanskrit nouns ending in accented *a* are shown generally to end in the mediaeval languages in *au*, and in the moderns in *o* or *ā* (viz. *ā* in Hindi, Bengali, Panjābi, Uriya and Mārāṭhi; *o* in Gujarāti and Sindhi); while Sanskrit nouns in unaccented *a* end in mediaeval languages in *u*, and in the moderns in *u* or *a*, or entirely reject the final vowel.]—The Cave of the Golden Rock, Dambula, Ceylon; by T. W. Rhys Davids. [Sir E. Tennent mentions one inscription in this rock-temple, which was translated for Turnour

by Mr. Armour. Mr. Davids has discovered eleven more, and now gives the oldest and most interesting inscription. From this inscription it appears that the temple was founded, not by Walagāma Bāhu about 86 B.C., as stated by Tennent, but in the time of Devānampiya Tissa (B.C. 246), the ally of Aśoka, and friend and patron of Mahindu, who introduced Buddhism in Ceylon.]—An Old Canarese Inscription from the Belgām District; by J. F. Fleet. [Taken from a stone tablet which stood originally in front of a small temple of Śankara in the bed of the river Malaprabhā.]—The Hot Springs of Unai; by W. Ramsay. —Oudh Folklore: a Legend of Balrampur; by W. C. Bennett. —Bhavabhūti in English Garb; by K. M. Banerjea. [Account of Bhavabhūti's Sanskrit dramas *Mahāvīracharita* and *Uttaradīnāchārīta*, translated by Pickford and Tawney respectively.]—Review [favourable] of P. Boyd's translation of the Sanskrit Buddhist drama *Nāgdnanda* with an introduction by Prof. Cowell; by A. H. B.—On the Ancient Remains in the Krishna District. [From the Report of the late Mr. J. A. C. Boswell to the Madras Revenue Department.]—The Asiatic Societies. [Extracts from their Reports and recent publications.]—Notes on the Bhariaks; by C. Scanlan. [This hill-tribe is here considered to belong to the great Gond family, though in their language and some of their customs they differ totally from the Gonds, with whom they neither eat nor drink nor intermarry. They acknowledge, however, the law of Camjhana, which imposes a servitude of some years on a man, wishing to marry into a family, who cannot afford the usual marriage settlement and to give presents to the bride's relatives. There are eighteen Bhariak *gots*, or clans.]—Notes, Queries, &c. [Amongst others, a query, by H. Blochmann, on the age of the use of tobacco in India.]

The Phoenix, November to February. (Philological articles.)—The Casket of Gems, a Tale from the Chinese; by Dr. Birch.—Buddhist Philosophy; by B. H. Hodgson (continued).—The Sūrangama Sūtra; by S. Beal.—Sunt'aun p'u, the Siamese Shakspeare.—Outline of a Japanese Drama.—Japanese Proverbs.—Reviews: De Rosny's *Anthologie japonaise*; and Turretini's *Atsume Gusa*; by W. G. Aston. [Both works, especially the former, deficient on the score of accuracy, but useful for general readers.]

The Indian Government has, if we may trust the reports of Indian newspapers, resolved to send out an European scholar to occupy the Sanskrit chair in the Government College of Madras, temporarily held by a native student, M. Seshagiri Shāstri. If such is really the case, it is to be hoped that the choice of the government will fall on a genuine Sanskrit scholar; as such a one alone can be expected to command the respect of native students, and to impart a new life to Sanskrit studies and literary research, which, in spite of the vast and tempting materials there offering themselves to the enthusiastic student, have for many years been at a very low ebb indeed.

Professor Albrecht Weber has just finished the second volume of the *Taittirīya-Saṃhita*, containing Kāṇḍas 5 to 7. He has added to this volume a special representation and criticism of the Padapāṭha of the *Taittirīya-Saṃhita*—a survey of the ritualistic employment of the single Anuvākas—the text of the *Kāṇḍanukrama*—an alphabetical list of the rik-pratīka, not only for the Saṃhitā, but also for the Brāhmaṇa and the Āraṇyaka. The Anuvākaprātīkas for the three texts have likewise been added.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The next number will be published on Monday, July 15, and Advertisements should be sent in by July 10.*

## General Literature and Art.

**Rude-Stone Monuments in all Countries; their Age and Uses.**  
By James Fergusson, D.C.L., F.R.S., V.P.R.A.S., F.R.I.B.A., &c. Murray.

THIS valuable and interesting treatise is the offspring of two other works by the same author, namely, his *Handbook of Architecture* (1854), and his *History of Architecture* (1864). In 1860, also, Mr. Fergusson contributed an article on the subject to the *Quarterly Review*, entitled "Stonehenge;" and in 1870 a further article in the same journal, entitled "Non-Historic Times," announced his latest views on the megalithic monument question.

Mr. Fergusson, therefore, may fairly claim the right of speaking with some authority, as an architect and antiquary, on the history and nature of these monuments, although it may not be correct to assume, as he does, that "no other antiquary . . . has gone so carefully and fully into the whole subject" (pref. p. vii) as he has done. Neither should it be held as conclusive evidence in favour of the correctness of Mr. Fergusson's opinions that no refutation followed the expression of these opinions in the *Quarterly* articles, especially as the articles in question appeared without that degree of weight and authority which the announcement of the writer's name would justly attach to them. An erroneous opinion may be many times expressed, and yet escape correction.

Failing other opponents, however, Mr. Fergusson becomes in some measure his own refutor. "On many minor points," he says, "I have offered suggestions which I do not feel sure that I could prove if challenged." These were made, he adds, "because it often happens that such suggestions turn the attention of others to points which would otherwise be overlooked . . . ; while, if disproved, they are only so much rubbish swept out of the path of truth" (p. ix). This practice may be allowable in a debating society, or may be adopted with advantage in contributing to a journal like *Notes and Queries*; but in a work of scientific character it is both inconvenient and objectionable. Where a subject is, moreover, already overlaid with difficulties such as yet retard the solution of this megalithic question, it is hardly justifiable for a writer of good authority to add to those difficulties by putting forward as statements founded on evidence what are merely tentative suggestions. Mr. Fergusson evidently feels this too, for he is rather severe on others guilty of a somewhat similar offence.

The author's opinion, as he candidly tells us, differs widely from that generally received. It has happened before now in the world's history that one man has been right and the rest of mankind wrong. But the reason which gives Mr. Fergusson confidence in the soundness of his views is merely that he has spent, as he says, the greater part of his life in studying the architecture of all nations.

VOL. III.—NO. 51.

The study of a question so complex as that presented by these megalithic remains might well occupy even the whole of a man's life without yielding the desired result; for the builders of these monuments have left no record of their erection, no legible inscriptions, nor "architectural features to reveal their history." And, even as Mr. Fergusson observes, the contents of these monuments being of a mixed character, consisting generally of bones, stones, iron, bronze, and gold, little dependence can be placed on the presence of any one class of objects to fix the age of these monuments "till it can be shown at what date their use did really cease" (p. 14). Reversing the process, Mr. Fergusson, instead of deducing the age of the monuments from the nature of their contents, endeavours to prove the age of the contents from that of the monuments in which they are found, the latter being by far the more difficult task.

The author's views regarding the age and nature of the class of Rude-Stone Monuments which form the subject of his work are briefly stated in the following propositions:—  
I. That they are generally sepulchral, or connected with the rites of the dead. II. That they are not temples in any usual or appropriate sense of the term. III. That they were generally erected by partly civilised races after they had come in contact with the Romans, and most of them may be considered as belonging to the first ten centuries of the Christian era. (P. 27.)

To the first of these propositions few competent antiquaries will object. The second will also find few dissentients, for the notion that dolmens were used as sacrificial altars by serpent-worshipping Druids is now well nigh exploded, although this class of remains will probably continue to be known for a long time to come by the name of "Druids' altars." Moreover, the qualification, "usual or appropriate sense," does not exclude the probability of dolmens and stone circles having been frequented for the celebration of funeral games in pre-Christian times. But the third proposition fixes the age of these monuments at too recent a date to receive the assent of archaeologists, unless based on indubitable evidence. And this evidence is wanting. It is not to be denied that sepulchral tumuli were erected in these islands, as well as on the continent, at dates long within the Christian era; but it does not follow that similar monuments were not also erected centuries before it. Even if it was clearly proved that King Gorm and Queen Thyra were buried in the tenth century in the mounds in Jutland that bear their names (the chambers in which, it is to be remarked, were formed of oak, not of stone; p. 297), it may not be quite certain that the tumuli were erected at the time, for there is abundant evidence to prove that even as late as the sixteenth century the practice of burying in ancient mounds was not altogether abandoned, in these islands at least. Of this a reliable instance is recorded in the *Annals of Loch-Cé*, an Irish chronicle (Rolls Publ. 1871), under the year 1581, where it is stated that an eminent person was buried at (or in) the *duma* of Ballintober, in Connaught. This *duma*, or tumulus, must have been then of great antiquity.

Mr. Fergusson disputes that any of these megalithic structures belong to a pre-historic or even pre-Christian age. There is no evidence of their erection before those eras, he says, and therefore they must have been built later. They are not mentioned by the classic writers, and therefore could not have existed in their time. But he fully appreciates, of course, the weakness of such negative evidence. On the other hand, he seems to disregard too much the value of historical traditions, which assign to the monuments an age far beyond the limit he allows. These are only cobwebs of fable, woven by "poets and pedants," which he feels no

remorse in brushing away, substituting his own "impressions" for national traditions, and this sometimes in such an arbitrary manner as to leave no room for argument. Speaking of the history of King Arthur, he says: "This is not the place to examine so large a question. It will be sufficient to state what I believe to be the main facts. Those who do not admit them need not read further." (P. 133.) By adopting his suggestion the incredulous student will miss the incorrect etymology of "Cat Coit Celidon," the scene of one of Arthur's battles, which Mr. Fergusson gives four pages further on, where he says that "*Coit*," the second member of the name, "only so far as the dictionaries tell us, means 'coracle,' and" (as *Cat* means a battle) "would seem to indicate a struggle in boats." But *Coit* is explained by the ninth-century glossarist Cormac (*voce* *Salchuait*) as "a name for a *wood* in Combrec," or Welsh. The English word "cot" had not then been adopted into Gaelic dictionaries.

"It is probable, after all," Mr. Fergusson says, "that it is from the Irish annals that the greatest amount of light will be thrown on the history and uses of the megalithic monuments" (p. 175). But this light will hardly be evolved by his process, which consists in setting aside, as totally unreliable the system of chronology and regnal lists on which these annals are based, and bringing together events and personages separated in the annals by wide periods of time. It suits Mr. Fergusson's theory of modernisation to bring into immediate contact the Tuatha De Danann dynasty, whose era the Irish annalists refer to a period long antecedent to the Christian era, and the dynasty of King Crimthann (circa A.D. 84); but if there is any element of truth in the historical traditions preserved in Irish MSS., from St. Patrick's age at least, the Tuatha De Dananns were so long extinct in Crimthann's time that they had already passed into fairies and gods, abiding in those hills and mounds some of which are now known to be chambered tumuli. And so far from the Four Masters having, "like truly patriotic Irishmen," carried back the history of their country to the Flood, they constructed no system of chronology themselves, but confined their labours to digesting the records which had descended to them from remote times. Granted that the minute details of a battle cannot be transmitted by oral tradition for a period of two thousand years, it is nevertheless credible that the bare record of important events may be preserved through that channel for at least ten centuries. The Gaelic-speaking people of the highlands of Scotland and Ireland still recite long lays and stories which Mr. John F. Campbell, that most excellent of *Shanachies*, will truly tell us have not existed in writing for perhaps six hundred years. On the subject of writing, too, Mr. Fergusson is not always a safe guide. Whether the art of writing was known in Ireland in or before the reign of Cormac Mac Art (A.D. 218-266), or was introduced by the Christian missionaries in the fifth century, as some authorities believe, has not yet been satisfactorily settled, but that it was extensively practised before the year 600 is very certain. This, however, is not the opinion of Mr. Fergusson, who considers that before the year 600 it was very little practised. In that year, he says, the Irish did not possess even a copy of their most celebrated literary monument, the *Táin Bó Chuailnge*, because "a mission was sent to Italy to copy one said to have existed there" (p. 196). But in the very passage from which he has drawn this conclusion (O'Curry's *Lectures*, p. 29), it is expressly stated that the copy in question had been carried eastwards (*i.e.* out of Ireland) at some previous time, by a "*saoi*," or sage.

Mr. Fergusson's examination of the history, extent, and character of the Irish monuments has been of too cursory a kind to justify him in expressing himself so positively as he

does regarding their age. "There may be other rude-stone monuments in Ireland," he says, "besides those described or alluded to in the preceding pages, but they can scarcely be very numerous or very important" (p. 237). Any one acquainted with the still unpublished materials of Irish history must know that the monuments hitherto discovered do not amount to a tithe of those mentioned in the Irish MSS., under various names, and referred to various ages and persons; and of those hitherto brought under notice, not one-fourth has attracted his attention. The magnificent three-chambered dolmen on the summit of Siabh-Claire at Duntrileague, in the county of Limerick, has escaped him, although it has a history; and the majestic circle and standing stones near Lough Gur, in the same county, are not noticed. The ancient traditions respecting these latter remains, which were certainly taken down at the earliest period of written history, indicate that in the first century of the Christian era their age and uses were totally forgotten. A hundred others might also be enumerated, including the huge pillar-stones at Punchestown, near Naas—the remains of the "*chorea gigantum*," which Geoffrey of Monmouth describes (or others like them) as having been removed to Stonehenge.

The author's personal investigation of the Irish monuments, though fruitful and instructive, was really very limited, for he seems to have altogether passed by the province of Munster, with its numerous remains of antiquity. He has certainly been industrious in consulting published authorities on the subject of his work; but it is not his fault that the most accurate sources of information are as yet unavailable to all but the few acquainted with the tongue in which they are written. Until these are published, all attempts at deciding the vexed question of the age of these structures must prove futile. One or two instances may be sufficient to show the danger of arriving at conclusions on imperfect data. The sepulchral remains near Cong, in Mayo, and at Carrowmore, in Sligo (which Mr. Fergusson at one time attributes to the Tuatha de Dananns, and at another to the Danes), are represented by him as marking, respectively, the battles of a Southern and Northern Moytura. This "no Irish antiquary has ventured to doubt," he says. It is not because there are not good grounds for doing so, at least as regards the Southern Moytura, or Moytura-Cunga. That there were two battles of Moytura fought in Ireland before the Christian era seems certain; but the most ancient MSS. represent them as fought in the same place, and somewhere in the north of Connaught. Before the seventeenth century, the stony neck of land between Loughs Mask and Corrib was not regarded as the site of a battle of Moytura-Cunga, or Moytura of Cong; and the account of the first battle of Moytura, of which Mr. Fergusson seems to have read a translation, does not countenance the presumption that it was fought in a spot so unsuited to a great battle. There is no place near Cong called Magh-Tuireadh, and apparently there never was; but the existence of Cunha (or "Cunga-Feichin," Fechin's *angustia*, St. Fechin, ob. A.D. 664) probably suggested to the Four Masters, who were among the earliest to identify the first battle of Moytura with the southern Cong, the propriety of locating the site of the battle there.

But there were other places named *Cunga*, or Cong, in Mayo and Sligo; and an older authority than the Four Masters places the field of battle of Magh-Tuireadh-Cunga to the north-west of Loch-Cé (Roscommon county), and consequently in the county of Sligo (see *Annals of Loch-Cé*, introd. pp. xxxvi-xxxix).

Mr. Fergusson finds, as he thinks, an important piece of evidence to support his theory in the history of a do'men near Ballina, on the west side of the river Moy, which he

assumes to have a date, and that date some time in the sixth century. It is, he says, the grave of four persons who were executed for murdering the grandson of a man who died A.D. 428. In this, however, Mr. Fergusson has been misled by Dr. O'Donovan; for the Irish MS. which the latter quotes as his authority (*Book of Lecan*, 237b), does not state, as he assumes, that the culprits were buried on the western bank of the Moy, opposite to Ard-na-riag (so called from their execution, *riag*), but implies that they were interred on the summit of the hill which is now known as Ardnaea, on the east side of the river.

When quoting others, however, Mr. Fergusson is not always correct himself. At p. 144, for instance, he cites Petrie's authority for the statement that a coin of Valentinian had been found *in* the mound of New Grange, whereas Petrie only said *on* the mound. His most serious offence in this line is where he attributes to the late Dr. J. Henthorn Todd opinions which are totally opposed to those entertained and often expressed by him. After fixing the era of the Firbolgs to his own satisfaction (B.C. 50), he says, "since the above was written, I have been gratified to find so eminent an authority as Dr. Henthorn Todd . . . arriving, by a very different road, at very nearly the same conclusion;" and quotes the assertion that the Firbolg "conquest of Ireland was not much older than Caesar's time, if it were not a good bit later," from "*Irish Nennius*, translated by J. H. Todd, Appendix C." There is no such appendix to the work; and the statements here fathered on Dr. Todd are found in No. 21 of the Additional Notes (p. c), which were all supplied by the late clever scholar, but fanciful critic, Mr. Algernon Herbert, as Mr. Fergusson might easily have seen by the initial (H.) at foot of the note, and the statement which Dr. Todd was careful to add in the title-page, fixing upon Mr. Herbert the responsibility for the opinions put forward in these Additional Notes.

Nevertheless, although Mr. Fergusson's views as to the age of these monuments may not meet with general acquiescence, every archaeologist must thank him for producing a very valuable and interesting work, well written and beautifully illustrated.

W. M. HENNESSY.

*Fifine at the Fair.* By Robert Browning. Smith, Elder, and Co.

THE story of Mr. Browning's new poem—the outward action of the characters—is of the simplest. A Frenchman and his wife, Elvire, stroll out at Pornic, where the Loire and the sea unite; they visit a summer fair where the husband admires the peculiar beauty of Fifine, the dancing-girl; they walk down to the beach and to the Druidical remains, and so return to their villa, where there is pushed into the husband's hands a letter—the enigmatical result of that largess of coin he had slipped into the pleading tambourine of the spangled dancer. But the story—the slight action—is the least important part of the poem of between two and three thousand lines spoken by the husband of Elvire to Elvire, momentarily jealous—nay, pained, a little unreasonably—by the admiration Fifine has evoked, and by that outburst of praise of a Bohemian-life and lawlessness—an outburst of feeling suggested, surely not created, by the flitting figures at the fair. The monologue, though spoken to the man's wife, and though often argumentative, is in truth meditative; and it is the meditation of a man who has the liveliness to feel Bohemian charms—the effervescence of spirit or of sense "frenetic to be free"—who has the capacity, denied alike to puritan and libertine, to see in life more ways than one, and yet the strong good sense to know that law is better than lawlessness, and the seemingly restricted sphere more fruitful than the search through space.

"Each step aside just proves divergency in vain.  
The wanderer brings home no profit from his quest  
Beyond the sad surmise that keeping house were best  
Could life begin anew. His problem posed aright  
Was—'From the given point evolve the infinite!'  
Not—'Spend thyself in space, endeavouring to joint  
Together, and so make infinite, point and point:  
Fix into one Elvire a fair-ful of Fifines!'  
Fifine, the foam-flake, she: Elvire, the sea's self, means  
Capacity at need to shower how many such!  
And yet we left her calm profundity, to clutch  
Foam-flutter, bell on bell, that, bursting at a touch,  
Blistered us for our pains. But wise, we want no more  
O' the fickle element. Enough of foam and roar!  
Landlocked we live and die henceforth: for here's the villa-door."

The key-note of the poem is struck by some couplets in the first act of Molière's *Don Juan*. Elvire, understanding neither his absence nor his excuses, addresses her husband:—"Vous plait-il, Don Juan, de nous éclaircir ces beaux mystères?" And before he, who is so voluble to Sganarelle, has stammered out a reply, she tells him that he can ill defend himself, that he should arm himself with a noble effrontery, and declare that in his sentiments towards her there is no change whatever. Now in Mr. Browning's poem the speaker has followed this advice. Armed with a noble effrontery—albeit he is anything but a mere reproduction of the Don Juan of the earlier dramatic poet—he plunges into the wide subject of the nature of man's love for woman and of his admiration for and liking of women; and in the diffuse *apologia* built up of countless illustrations, similes, subtleties, and ingenuities, he is sometimes all sophistry and sometimes all justice. Sometimes he deserves the *naïve* remark of Sganarelle: "Je ne sais que dire; car vous tournez les choses d'une manière qu'il semble que vous avez raison; et cependant il est vrai que vous ne l'avez pas;" and sometimes, as in the passage already quoted, his conclusions are full of wisdom and virtue: so that on the whole he is a character unusually attractive for a great analyst to examine—for a great painter to depict. And here, in the one hundred and seventy pages of this book, is his heart exposed as on a dissecting table; and Mr. Browning, with his keen instrument in hand, points out what is morbid and what is healthy in his complex organization.

Would that his exposition were always lucid! Difficult it is, and perhaps must be, by reason of its subtlety; but surely there is here and there a wilful obscurity, which will restrict the book for the most part to the large but not yet enormous circle of Mr. Browning's warm admirers. Is it possible, some may ask, as they stand amazed at the difficulties of *Fifine at the Fair*, that the poet has written of purpose an enigma—to the Rosamund's bower of this labyrinth can they only reach who grasp the necessary thread? No, indeed; but it is probable that Mr. Browning, conscious that in our day most reading is careless reading, is not sorry to give men what they *cannot* read carelessly, and that sometimes in doing this—say in *Fifine*: not in *Balaustion*: not in *Hohenstiel*—he does much more than is needed to dispel the indolence which is the mode. Now and then he is wantonly obscure, and now and then he writes in a French idiom, not an English—talks of "white nights," for instance, instead of sleepless nights—he who has done so much in *The Ring and the Book* and in many another work (yes, in this very volume) to preserve or to recall the sturdy English banished from novel and newspaper.

Of the general mode of treatment followed in this poem, and of the poem's place amongst Mr. Browning's works, a little must here be said. As a poem for the most part of *intime* life and thought, with no more background, no more local colour, than the due presentation of character requires, it may be considered an analysis comparable chiefly with

the *Scènes de la Vie privée* of Balzac. In this way, it is related to *Any Wife to any Husband*, to *Dés Aliter Visum*, and to *James Lee*. These indeed are but some important members of that family group of Mr. Browning's poems of which *Fifine* itself must now be accounted the head. But as an elaborated exposition of individual and peculiar character, the new book claims kinship with the "apologies" of *Bishop Blougram* and of *Prince Hohenstiel-Schwangau*, and it introduces us to a personage hardly less subtle and complex than these, though his part is played upon the Pornic shore instead of among the intellectual refinements and cavillings of theologians, or on the crater of a volcanic "society" requiring to be "saved."

In treating the subject that is broached and probed in *Fifine at the Fair*, most writers would have constructed a dialogue: the husband would have spoken first, and then the wife. But there is greater subtlety in Mr. Browning's method of making the husband frame for the wife her answers, retorts, objections, and embody these, together with his own discourse, in one long monologue; for it gives room for utterances from three points of view and types of character, instead of only two. The husband speaks in the main for himself; but at times he speaks for the wife as she would really speak, and at times he speaks for her as there could only speak the woman he *imagines* her to be.

Save in the prologue and epilogue, the book is written in couplets of twelve syllables to the line—spirited verse, often with the buoyancy and now and then with the directness of *Hervé Riel*, and, except for occasional roughness, not open to the conventional charges preferred against the versification of this poet. He also can jingle rhymes as well as another, though generally if one thinks of him with a great rhymester such as Victor Hugo, one thinks of him by way of contrast, as of one whose poetry contains the greatest quantity of thought with (often: not always) the least amount of splendour, while Victor Hugo's contains the greatest superficial splendour with the least possible amount of thought. With the one poet, manner is the chief thing: with the other, matter. And Browning at his best has in truth the terseness in fulness which is the special note and most unfailing sign of the great men in the greatest literatures—he has, when at his best, the pregnancy of Horace, Goethe, Balzac.

Of details, it may first be said that *Fifine at the Fair* contains two especially fine and suggestive illustrations, which should strike everyone—nor those the least who consider that work so substantial as the whole of this requires an often pondered judgment and the test of years. One is that parable of the householder's comparative regard for Rafael and for Doré: the other, the parable of the half hewn, half shapeless block in which only the sympathetic mind could trace the undreamt-of value of the work of Michel Agnolo. The laudation of the unfettered life of wandering gypsies—natural enough to most men in a mood that is fleeting—will remind at once of *Waring* and of "the wild joy of living," sung so splendidly in *Saul*. The portrait of *Fifine* herself—to mention another detail, and to end with it—is in the face delicate and strongly individual, and in the attitude vivid and bold.

" . . . . Either ear is cut

Thin as a dusk-leaved rose carved from a cocoa nut.  
And then, her neck! Now, grant you had the power to deck,  
Just as your fancy pleased, the bistre-length of neck,  
Could lay, to shine against its shade, a moonlike row  
Of pearl, each round and white as bubble, Cupids blow  
Big out of mothers' milk,—what pearl moon would surpass  
That string of mock-turquoise, those almandines of glass,  
Where girlhood terminates? For with breasts' birth commence  
The boy, and page costume, till pink and impudence  
End admirably all: complete, the creature trips  
Our way now, brings sunshine upon her spangled hips,

As here she fronts us full, with pose half frank, half fierce;  
No other than *Fifine*  
Points toe, imposes haunch, and pleads with tambourine."

The portrait is completed, and in a sense exalted, elsewhere in the book, by the description of that occasional scorn with which *Fifine* surveys the crowd that admires her.

"Know all of me outside: the rest be emptiness

For such as you . . . . .  
I'm just my instrument: sound hollow: mere smooth skin  
Stretched o'er gilt framework, I: rub-dub, nought else within—  
Always for such as you!—if I have use elsewhere—  
If certain bells, now mute, can jingle—need you care?"

FREDERICK WEDMORE.

Notes sur l'Angleterre. Par H. Taine. Paris: Hachette.

Notes on England. By H. Taine. Translated by M. F. Rae. Strahan and Co.

M. TAINE'S *Notes* (the result of visits made to England in the years 1861-62 and 1871), together with the able contributions of M. Esquiros to the *Revue des deux Mondes*, will have the effect of establishing the long controverted fact that it is possible for a Frenchman to write of England without falling into a series of grotesque misrepresentations in regard to what concerns our social life and domestic habits. One of the leading French philosophers has come over with the intention of studying us, and the wish to like us, and if he has failed in the latter, it is owing to differences of idiosyncrasy between his nation and ours, the development of which is the chief object of his book. Moreover, on reading his opening pages descriptive of the meteorological caprices of London, we feel that we can hardly overestimate the objective spirit which is, on the whole, so commendable in this work. What indeed must be the feelings of a foreigner who awakes one morning to find darkness not only visible but tangible, in a hideous yellow fog clinging to the face of London, and in the author's own words we give his assurance that his tenacity of life was put to the test by his first experience of a rainy Sunday in it:—"Un dimanche à Londres par la pluie: boutiques fermées, rues presque vides; c'est l'aspect d'un cimetière immense et décent. Les rares passants, sous leur parapluie, dans le désert des squares et des rues, ont l'air d'ombres inquiètes qui reviennent; cela est horrible. Je n'avais pas l'idée d'un pareil spectacle, et l'on dit qu'il est fréquent à Londres. Petite pluie fine serrée, impitoyable; à la voir, il n'y a pas de raison pour qu'elle ne dure pas jusqu'à la fin des siècles; les pieds clapotent, il y a de l'eau partout, de l'eau sale, imprégnée d'une odeur de suie. Dans le Strand surtout, et dans le reste de la Cité, après une heure de marche, on a le spleen, on conçoit le suicide." It is easy to conceive what, under these depressing circumstances, must be the effect produced by our mean and irregular street architecture—irregular in a fashion which can only be rendered tolerable by the beauty of colour so conspicuous for its absence. And, in realising the general sense of ugliness and discomfort which must have weighed him down, we may pardon M. Taine for pointing out Somerset House as a mark for particular reprobation, and the Wellington "Achilles" in the Park, which, seeing that it is a copy of an antique "Slave holding Horses," in the Capitol at Rome, is hardly a fair example of British aesthetic depravity.

In the Parks, and in the fashionable houses open to him during the season, he made careful studies of the different specimens of mankind to be found there. Nor does he confine his selection of types to both sexes in the upper classes of society. Ladies of fashion, women-servants, M.P.'s, country squires, clergymen, guardsmen, footmen, are all equally brought under contribution—classes dif-

fering from one another in most respects, but made kin by three touches of British nature, viz. : the consumption of hetacombs of tasteless meat and watery vegetables, the preference for the strongest of liquids, and an insensibility to the caloric properties of pickles. Notwithstanding, he favours the continental impression that these ogres as a rule make excellent husbands and wives. The praise he freely bestows on the beauty of our women, he modifies in the epigram, "*La laideur est plus laide que chez nous.*" He seems to have been unfortunate in the frequent intrusion upon his vision of the original of the conventional French caricature "*l'Anglaise pour rire*"—the gaunt middle-aged bespectacled female, who is clothed, but not dressed, and is remarkable for the prominence of her teeth; the prevalence of which latter peculiarity causing him to wonder whether it may not be connected with our carnivorous habits, a solution so ingenious that we are quite ashamed to spoil it by the prosaic suggestion that it is probably owing to the narrowness of our jaws. At the other extreme, we have the coarse red-faced type of Englishwoman—the "*female Bull*," who so distressed the sensibilities of Nathaniel Hawthorne. Taking the English and French woman at their best, he is unable to refrain from summing up the contrast by comparing the former to a comely, tasteless, rosy peach, and the latter to a strawberry fragrant with perfume and delicious to the taste. With regard to the English "*Miss*," she comes in for the regulation amount of enthusiasm and poetry with which she is traditionally invested in the minds of his countrymen; but, on the whole, it is not in dealing with types that M. Taine is furthest from M. Assolant.

Like his illustrious countryman Montalembert, he wanders through our public schools and universities with feelings of generous envy and wondering admiration. In contrast to the unhappy overworked French scholars, deprived of a vestige of independence, pursuing their studies between four walls in a crowded street, or for diversion walking out in strings of two abreast, there was something idyllic to him in the boys whom he met in straw hats wandering about the country in the neighbourhood of Harrow, or observed reading astride on the bannisters; and in attempting to do justice to the glories of Oxford he is evidently under the pressure of feelings which find a weak vehicle in words. At the same time it has not escaped him that our system of training, although admirably adapted for forming the character of youth, leaves the intellectual side comparatively untouched.

And although the child is father of the man, and the mind of an ordinary Englishman may be felicitously compared, as it is by him, to Murray's handbook, full of facts but without ideas, we must correct the libellous inference that the minds of our schoolboys are store-houses of facts. The personal independence and impatience of all but moral restraint which permeates our educational system he greets again under a new form in the *sans-gêne* of the House of Commons, in spite of its informality unquestionably the most dignified representative assembly in the world; for which advantage it is probably largely indebted to the position occupied by the Speaker, who is certainly a fortunate contrast to the President of the French Chamber, stamping his foot and ringing his bell, like the usher of a school trying to keep a set of unruly boys in order.

In short, speaking broadly, he sees nothing but what is most praiseworthy in all that regards the practical side of our national life; while he is unqualified in his disapproval of all that concerns our taste, and especially in the remarks on our aesthetics provoked by visits to the National Gallery, Kensington Museum, and International

Exhibition, is he obviously uncompromising in the antithesis. It is evident that he can get up no rhapsodies over our Lelys, and Knellers, or even over our Reynoldses and Gainsboroughs; while he hints that taking our school of art as a whole, we have never reached the level attained by Ingres or (Heaven save the mark!) by David. Moreover, it is difficult to acquit him of a deliberate intention in quoting as examples of Turner's style no works of his which were executed before his genius burst all bonds, and rioted at last to such excess that in the straining after effect the intention disappeared in the effort, and what was never meant to be realistic ceased to be even suggestive. In our pictures, as in everything else about us, our critic finds the practical element obtrusive; for is not the entire attention of our painters concentrated on the psychological aspects of humanity, until we have arrived at the pitch of endowing even our portraits of dogs with the expression of a human soul? Poems, the fitting medium for which should be the pen, not the brush, crowd the walls of our exhibitions. The philosopher, the student of human nature, sets his seal on our canvasses, but, in our anxiety to "point a moral and adorn a tale," where is Beauty to whom Art should be but the handmaiden? The poet is there—the skilful workman, but where is the artist? He intimates that, in our dislike to the merely sensuous, we seem to him to have fallen into the positively repellent. At the same time he is incorrect in treating pre-Raphaelitism as an indication of the national taste, instead of as a very partial reaction from it, and we can assure him that there are many on this side of the water who, like himself, are unable to recognise anything but a defamation of nature in representations of scarlet poppies stuck at intervals in apple-green turf; apple-green graveyards in which each separate blade of grass is shaped, and shines like a penknife; rasping sunsets which might be intended for fireworks; and similar atrocities which result from the attempt to paint nature as she is, instead of as she looks.

As we have nearly done with M. Taine, we make haste to sum up his general experiences. He was fortunate enough, when leaving England last year, to fall in with a friend who, like him, had been studying ourselves, with whom he compared notes, which resolved themselves into a comparison of the forms of civilisation in England and France. "*Laquelle vaut le mieux?*" They are of one mind in giving to England the superiority of political constitution, which is stable, and not in danger of being unmade and badly remade every twenty years; in the material advantages which they attribute to the established form of belief—inculcating self-control and the culture of the will; in the greatness of capital accumulated in the country, together with our superior physical resources. On the other hand, France is vindicated by her climate; by the distribution of wealth which gives to none a large share, and yet enough to all; while her home life and social gatherings are characterized by greater intimacy, more politeness, more of the elements of real enjoyment than in England. They hold that these points tend to render "*l'Anglais plus fort, le Français plus heureux.*" Evidently to M. Taine, France is a lovely and charming coquette—wilful, distracting, but whom, in spite of her faults, it is impossible not to adore, while England is personified in his eyes by the worthy sensible type of womanhood for whom it is difficult to feel anything but the greatest possible esteem. He is at great pains to impress his appreciation of the more solid qualities which claim his regard, and those who take umbrage at his opinion that our food and our women are equally insipid and ill-dressed, may console themselves by thinking that, when he was among us last year, there were other points of contrast between the two sides of the Channel.

FRANCES MARY CHARLTON.

## THE PARIS SALON, 1872.

## [SECOND ARTICLE.]

IT shows the break-up of traditions in French art that work like that of M. Carolus Duran should receive respectful treatment at the hands of official criticism in the *Revue des deux Mondes*. M. Duvergier de Hauranne is the critic; and he is scarcely at all scandalised; yet M. Duran's two portraits might scandalise much less conservative instincts than those to which the *Revue des deux Mondes* usually gives expression. They are the extreme negation of everything like correct canons or discreet instincts in art; they have more than all, the crying colour, the vulgarities and violences, which used to be supposed the peculiar appanage of our own school. One lady is red-headed and stout, and sits in an iron-grey dress on a sofa of purplish maroon, flourishing a scarlet fan; the carpet being light green, and the background light greenish blue. The other stands up, in attire and surroundings equally full of gorgeous display and contrast; there is an indescribable, almost a revolting, coarseness in both; but yet the execution has a showy brilliancy as well as a real mastery which seems to silence remonstrance, and makes these the two most applauded things of the exhibition. Next after them, the portrait of M. Thiers by M<sup>lle</sup> Nêlie Jacquemart is looked at, but is not good; it has a certain emptiness and pomposity, as if the painter had been thinking more about the sitter's office than about his character, which suit ill with such a vivacious *bourgeois* countenance; the same lady has done better in previous years. There is a very good level of refined portrait-painting, both of male and female subjects, maintained in the work of M. Delaunay, M. Lefebvre, M. Liévin de Wynne, M. Saint-Pierre; while M. Ricard, without loss of his old sense of dignity and likeness, gets greener than ever in colour, and seems generally weakening; and M. Hébert sends from Rome a lamentably vaporous and insubstantial "Marquise," betraying, we would say, ill-health as well as the effort at over-spirituality. M. Baudry, of the Institute, quits his occupation of decorator to the new Opera to send a small portrait of M. Edmond About, executed with almost the wiry minuteness of enamel, but very living in expression and likeness; the sitter is in travelling furs and cap, relieved against a blue ground. Two portraits not as much noticed as they deserve, because they are entirely without routine attractiveness, are those painted by M. Gaillard, the engraver; one of them in particular, the ugly head of a shrewd middle-aged woman of house-keeper type, is a marvel of precise and patient realism and a fine example of draughtsmanship. M. Jalabert and M. Gigcomotti are both remarked for portraits of precisely the opposite kind—more or less flattered ideals of graceful costume and coquetry. M. Jalabert in particular has probably never done so well as in this head of M<sup>me</sup> Canrobert, with its pleasant tones of grey and pearl.

Next after the most conspicuous of the portraits above named, or on a level with them, the pictures bearing upon late events have attracted the popular pressure. Few of these are good; one of the best was M. Détaillé's "Prussian Baggage-train in the Snow," with a great deal of clever expression in its personages, and a singular directness and ready impromptu of execution; but this has been warned off the gallery walls in deference to German sensibilities. There remain the two illustrations of the Metz campaign and its disasters, furnished by M. Protais; the "Coup de Canon," by M. Berne-Bellecœur; the "Défense de St.-Quentin," of M. Armand-Dumaresq; "The Wounded Bugler at Reichshoffen," by M. J. L. Brown. Of these artists, M. Protais has been long known for his mechanical trick of drawing and grouping French infantry soldiers to order; those of this year are neither better nor worse drawn and grouped than usual; the distant masses being generally disposed with considerable skill and effect, the nearer individual figures having the quality of wood, and being in this case still further spoilt by an ill-conceived tragedy and over-done sentimentalism. In another way, M. Armand Dumaresq's picture is broken up, vulgar, and bad; the white charger and rider of M. Brown have a certain undeniable vigour and daring, but it is too horrible a cynicism which thus covers everything with spouted blood, and seizes the moment of sudden and maddest agony in man and beast. Another war picture, called "L'Oublié"—a wounded mobile left to freeze, and struggling for the last time to lift himself against the weight of his knapsack—has the same quality of cold painfulness and

intolerable horror. M. de Bellecœur does best by far with his battery interior; there is a precise simplicity and a somewhat bald lifelikeness in the gunners' figures which suggest photography; indeed the picture looks like a composition very carefully compiled upon the data of a class of photographs which have been common enough. It is done with a quiet firmness of idea and execution, and an excellent tone and gradation in the landscape.

In the landscapes of the year there are some notable decadences. It is some time since M. Cabat, of the Institute, has abandoned nature and study, in his scenes of wild Breton country and Druidic forests, for a fictitious or at least artificial grandiosity; and his "Stormy Weather" and "Druid Fountain" of 1872 are examples which show the fiction or artifice growing more and more confirmed. Quite as dignified in reality, and infinitely more sincere and unpretending, are the two large landscapes (also from Brittany) which M. Camille Bernier sends under the title of "January" and "August"; the latter, indeed, with its solidly and candidly painted range of farm-buildings and timber stack amid great trees, is perhaps the capital landscape of the exhibition. M. Daubigny seems disposed to rest on his laurels, or to trust to those which his son may be on the path to earn; his picture of a cooper at work, and of the windmills of Dordrecht, are black, hard, and empty in comparison with his best work; while the "Fishers' Return" of the younger (Karl Pierre) Daubigny is little more than a sketch, although a powerful one, in imitation of his father's large impressive manner. Corot, again, is not himself; his view near his house at Ville d'Avray, and another near Arras, are both of them exaggerations of his exquisite specialty—the foliage too systematically flaky, the high lights too regularly dispersed, the cool grey tones and pleasant sylvan composition carrying too much the sense of the studio and of convention. And what is worse is that M. Corot has to see himself caricatured by imitators, who find the surface aspect of his work, and effects of his predilection, easy to catch; of these M. Caillou is one of the most to be deprecated. M. Chintreuil, on the other hand, is a pupil of Corot, yet anything but a slavish one; his large landscape, with a moist spring haze dimming and mystifying the scale and outline of everything, and an avenue of orchard trees in blossom and dripping in the soft weather, is one of the most promising in the gallery. Were it not that M. Émile Breton had done much the same sort of thing often before, one would say that his "Winter Morning" and "Winter Evening" deserve very great credit; the former of them, at least, is an admirable piece of snow effect—a stream, a cottage, tall willows, having each spray thick with snow, brambles and bushes marked with it, the sky threatening still more, and though its colour is white, showing somehow lurid and opaque against the stronger white of the earth and trees. For good landscapes with animals, one may note the Breton moors and horses of M. Théodore Valério, the wilder and remoter traveller's picture of M. Tournemine, showing with much power and spirit a fight between an African elephant and lion.

SIDNEY COLVIN.

## NOTES.

Neither French nor German art-periodicals for the current fortnight offer much news of interest. An article of Franz Hottner in the *Zeitschrift für bildende Kunst* pronounces Kundmann's monument to Schubert (formally inaugurated at the end of May) a successful solution of that difficult artistic problem.—The continuation of Bode's valuable papers on the painters of Haarlem deals with the Ruisdael family, and is illustrated by two powerful etchings of the chief of the name; one from the hand of Unger, the other from that of L. Fischer.—In the *Gazette des Beaux-Arts*, M. Beulé continues his notes of the Athenian excavations, which will by and by form an entertaining supplement to the well-known *Acropole d'Athènes*.—The two most important critical notices of the Salon (apart from the feuilletons of the daily papers) are by M. Paul Mantz in the *Gazette des Beaux-Arts*, and by M. Duvergier de Hauranne in the *Revue des deux Mondes*.

Cav. Gennaro Vigo has discovered a copy of the *Annals* of Matteo Spinelli da Giovenazzo, which settles the controversy respecting their genuineness, and secures to Naples the credit of having produced the first historian of Italy who wrote in Italian.

**Theology.***KALISCH ON LEVITICUS.*

**A Historical and Critical Commentary on the Old Testament.** With a New Translation. By M. M. Kalisch, Phil. Doc., M.A. *Leviticus*. Longmans. Part I., 1867; Part II., 1872.

It is a remarkable coincidence, which creates some slight presumption in favour of their common hypothesis, that the sixth part of Bishop Colenso on the Pentateuch, and the second of Dr. Kalisch on Leviticus, should have appeared almost simultaneously. The former work is the more comprehensive of the two, and its consideration may therefore be postponed. The latter forms part of a commentary the first volume of which, on Exodus, appeared in 1855, and was conservative in tendency; the second, on Genesis, in 1858, and was distinctly critical in spirit; the third, on the first part of Leviticus, in 1867; and the fourth, completing that book, in the present year. It is singular that so fruitful a writer should have met with such slight recognition from English students. Even Mr. F. C. Cook and his conscientious fellow-workers seldom mention his name. The only exception, so far as we know, among native authors, is the learned Scotch Roman Catholic, Dr. W. Smith, though the fragmentary examination which he bestows (*Book of Moses*, &c. vol. i. pp. 504-516) entirely fails to do justice to the cumulative argument of Dr. Kalisch. This strange neglect of an eminent scholar cannot be accidental, and it may facilitate our task if we premise a few remarks on the causes which have combined to produce this result.

The first which occurs to us is the un-English cast of Dr. Kalisch's style; a venial fault, which must not prevent us from recognising the remarkable degree in which he has mastered the difficulties of our language. The next is his excessive accumulation of details, a defect which borders so closely on a virtue that we can only regret its deterrent influence on readers. The third is of more importance, because it threatens to postpone indefinitely a fair consideration of the author's opinions. We refer to his growing theological dogmatism, and particularly to some inconsiderate controversial effusions in the first part of his work. Let no one misunderstand us. We are not pleading for any evasion of the difficulties involved in the traditional theology. We simply ask that the historical investigation of the Scriptures may be kept distinct from a criticism of their contents entirely based on modern scientific theories. And this on three grounds: first, that the necessary gifts for such different kinds of criticism are seldom found united in the same person; secondly, that many Biblical students are accessible to a historical argument, but object to a rough

and ready inference from the impossibility of miracles and predictions; and, thirdly, that an internecine war between modern criticism and the religious views of the majority is highly prejudicial to the interests of general culture. A special reason for the slight success of his *Leviticus* may be the author's unwise assumption of originality. He appears to ignore the fact that the hypothesis which he so ably maintains is the common property of a small but influential band of recent critics.

It is now ten years since a learned Jewish scholar, Dr. Julius Popper, made a strictly scientific attempt\* to show that the account of the construction of the tabernacle in Exod. xxxv.-xl., and that of the consecration of Aaron and his sons in Lev. viii.-x., received their present form long after the Babylonian exile; in other words, that the supposed earliest of the Pentateuch records, so far from being homogeneous, has been retouched and added to on more than one occasion. Whether from the severity of its style, or the obscurity of its author (although it was reviewed favourably by no less a critic than Dr. Geiger), this important work seems to have fallen almost dead on the learned world. But its leading idea could not long be ignored. It represented a natural reaction against the subjective method of previous critics. It also supplied, or professed to supply, a firm historical starting-point for further researches. Accordingly in 1866, Dr. K. H. Graf, influenced perhaps by the teaching of his countryman, Professor Reuss, of Strassburg, revived the old theory of the post-exile origin of the sacerdotal legislation. But his work,† small as it is in extent, was far from being a feeble echo of Vatke and George. Its ability has not yet perhaps been sufficiently recognised, but some of its effects are already visible in the avowed adoption of similar views upon Leviticus, &c. by such able critics as Lagarde, Merx, Kuenen,‡ and, we may now add, Colenso. These particulars are not only important bibliographically. They prove the existence of a powerful current of critical opinion. And without detracting from that independence which the author so justly prizes, we think that a simple mention of these facts would have increased the tenability of his position.

But our readers will be impatient for a few particulars concerning the second part, which has lately appeared. They will perhaps recollect that Dr. Kalisch, in his first volume, began to analyse Leviticus into a number of sections or codes "written, enlarged, and modified by different authors," all of them later than the Deuteronomist, "in harmony with the necessities and altered conditions of their respective times." (Part i. p. xx.) This view is carried out at much greater length in the second volume, which deals with the remainder of the book of Leviticus, beginning at chap. xi. On comparing the laws of purity and diet, the sabbath and the festivals, the sabbatical year and the jubilee with the parallel passages of Deuteronomy, Dr. Kalisch discovers that the regulations of Leviticus presuppose such an advance in hierarchical organization, and in moral and spiritual culture, as would alone be sufficient to indicate a more recent origin. Another parallel is drawn between certain passages of Leviticus and the prophecy of Ezekiel. The directions relating to the priests, the sacrifices, and the festivals, framed by the latter for his ideal state (Ezek. xliii.-xlv.), are found to be "greatly at variance with those of Leviticus," from which it is inferred that "the book of Leviticus did not exist, or had at least no divine

\* *Der biblische Bericht über die Stiftshütte* (Leipzig, 1862).

† *Die geschichtlichen Bücher des Alten Testaments* (Leipzig, 1866).

‡ It is strange that Dr. Kalisch only refers to an incomplete French translation of Kuenen's *Onderzoek*. The matured opinions of the latter must be sought in *De Godsdienst van Israel* (twee deelen; Haarlem, 1869, 1870).

authority, in the earlier years of the Babylonian captivity." Passing on to Lev. xxvi. 3-46 (which Bleek himself admits to be much later than Moses), Dr. Kalisch finds the destruction of the Jewish state and the misery of the exiles so vividly described that this section can only have been written at "an advanced period of the Babylonian rule." Another step is gained by investigating the laws relative to the sin-offerings and the high-priesthood, the day of atonement and the year of jubilee, "the existence or full development of which cannot be proved until long after the captivity." The day of atonement, with which the year of jubilee was associated, was unknown, according to Dr. Kalisch, in the time of Nehemiah, "and we shall probably be near the truth if, considering the spirit of the concluding chapter on votive offerings and tithes, we place the final revision of Leviticus and of the Pentateuch at about B.C. 400." (Part ii. pp. 637-639.)

There is little that is peculiar to the author in the process by which he arrives at this conclusion. We still desiderate a shorter and clearer view of the argument, such as would be supplied by a translation of Graf's *Die geschichtlichen Bücher* or the second volume of Kuenen's *Godsdienst*. It is evident, however, that Dr. Kalisch has been influenced by contemporary criticism in a much less degree than Bishop Colenso, and his mode of expressing an argument is by no means devoid of originality. We select the following as a favourable specimen; it is taken from a most interesting essay on the day of atonement:—

"But simultaneously with the historical, the inward and spiritual expansion of the Hebrew festivals was worked out. This expansion was the fruit of that growing conviction of the sinfulness of man, and of his need of expiation before a holy and perfect God, which is the main attribute of a pious frame of mind, and which, if manifested with earnestness and purity of purpose, invariably indicates the last and highest stage of religious life. We have on previous occasions attempted to describe this feeling of moral dependence and self-humiliation, as evinced in the Hebrew Scriptures, and especially in the Pentateuch; it was naturally fostered and strengthened by the misfortunes and struggles of the exile, which the guilty and remorseful conscience of the nation readily attributed to past iniquities; and it gave rise to the *sin-offerings*, the latest development of the noblest class of sacrifices, those of expiation. As these grew in depth and popularity, they were associated with all festive and solemn days, and were superadded to the older holocausts and thank-offerings. They could not, before the Babylonian exile, have been invested with the minute ceremonials and the subtle gradations specified in Leviticus, as we have before proved; in the first temple, they could not have been presented in the manner described by the Levitical legislator, because that temple had no curtain against which the blood could be sprinkled; in fact, they attained their highest and final form only during the time of Zerubbabel's temple. And the crowning stone of that religious edifice, which demanded the incessant labour of more than a thousand years, was the day of atonement as instituted in Leviticus. It combined, as in one focus, all the scattered rays of spiritualism, which in successive periods had helped to dispel superstition and frivolity; and it kindled a flame of devotion which, if rightly directed, might well cleanse the heart from egotism and pride, and raise the mind from worldliness to a yearning after light and truth.

"Thus the vast circle was completed: the festivals of the Hebrews, like nearly all their institutions, had passed through three distinct phases—the natural or cosmic, the historical or commemorative, and the ethical or spiritual—and they were by this process more and more enlarged, enriched, and refined." (Part ii. pp. 276, 277.)

It is not surprising that speculations like these should have met with a vehement opposition not only from the "orthodox" but even from many disinterested critics. The former were not unnaturally startled (a) at the supposition of "fraud" in a system of such high authority; the latter at (b) the bold originality of conception ascribed to the Levitical legislators, which contrasted, according to them, with the otherwise unproductive character of the age of Ezra, and (c) the sudden extinction of the freer and more childlike views of religion inculcated by the prophets. And both, perhaps, were influenced to some extent by (a) the

apparent improbability that a system of modern origin should be accepted by the nation as the code observed by their ancestors. These are serious objections, and deserve a more detailed discussion than we are allowed to give. But with regard to (a), it is not out of place to refer to that distinction between the divine and the human element in the Scriptures which is accepted by all modern Protestant writers on inspiration as "the very basis of their reasoning." (See Dr. Hannah's *Bampton Lectures*, 1863, p. 256, note 3.) From such a point of view it is not *a priori* improbable that a disproportion between the religious and the moral standard should be traceable even in the work of an inspired writer, like Leviticus. If we further admit, as all moderate students of the Hebrew Bible are beginning to do, the claims of literary criticism, the occurrence of "pious frauds," as they are called, in the Old Testament is raised to a positive certainty. It may be questioned, however, whether "fraud" is quite the right word for these phenomena. It is possible, as many facts noticed by Geiger tend to show, that Ezra and his successors invested revelation with a sort of "germinant" character, that is, that they regarded their religious books not as historical records, but as forms of truth with an indefinite capacity of expansion. Hence, perhaps, we may account for the reconstruction of Jewish history in Chronicles, and the reorganization of the established religion in the middle books of the Pentateuch. With regard to (b), we need only ask, what evidence is there for the unproductive character ascribed to this period? Prophetic inspiration, indeed, was on the wane, and finally died out altogether, but the later portion of the Hagiographa is sufficient to redeem the credit of that silver age. To objection (c), two forms of answer may be given. We may either follow Dr. Kuenen (*Godsdienst*, ii. 142-146), and infer from Neh. xiii., compared with Malachi on the one hand and Ruth and Jonah on the other, that an influential party was opposed to the Levitical innovations; or we may point out, with Dr. Kalisch in the passage quoted above, that the national religion had passed into a new phase, and had gained in depth what it had lost in childlike simplicity. The last objection (d) loses much of its force when we consider the importance of the priestly element in the post-exile period, and the facility with which new laws could be imposed, under the garb of antiquity, on those who had grown up in ignorance of the past. And whether probable or not, a minute interference with the text of the Pentateuch is not obscurely indicated by the curious legend of Ezra reproducing the law from memory by divine assistance. It is true that our earliest authority (4 Esdras xiv. 21, 22, 37-42) is later than the Christian era, but this very circumstance confirms the antiquity of the legend. The success of Ezra's innovations, and the general recognition of the Pentateuch as the law of Moses, would naturally obscure the tradition, so far as this seemed to detract from the credit of the latter. And the supernatural circumstances of the story were only too congenial to the growing superstition of the age.

But whatever view be taken of the author's conclusions, there can be no two opinions as to the value of his method. He is not one of those who pretend to discover secrets by a faculty of divination. He lays no undue stress on the analysis of style, nor on the argument *à silentio*, remembering that the facts revealed by the former are susceptible of various explanations, and that the absence of testimonies to the existence of a law is not decisive of its non-existence. His method is, in a word, to proceed from the known to the unknown. We cannot, however, help regretting that he has left one side of his question untouched. It is well known that Graf, followed in part by Colenso, draws a broad line

between most of the narratives in the "Fundamental Record" and the sacerdotal legislative portions; Kuenen, on the other hand, maintains in a certain sense the unity of the Record, and at the same time its post-exile origin. The subject is important, and we should have been glad of more light from Dr. Kalisch. As for the Levitical legislation, we know that, whether framed after the exile or not, it only attained canonical authority in the Persian period. To a great part of the nation it had therefore been practically non-existent. But to the date of the primary Elohist narratives no one can plead indifference, for upon it depends, to some extent, the possibility of retracing the outlines of Israelitish history.

And here we part from the author for the present. His results are for the most part so new to English students, and so liable to misapprehension, that we feared to distract the reader's attention by critical digressions. The illustrative sections of the work, especially those on the day of atonement, the sabbatical year, and the year of jubilee, are a pure gain to Biblical science. The philological notes are careful and erudite, and provoke fewer objections on the score of tact than the corresponding sections of *Genesis*. We hope to return to the purely critical portion in reviewing the sixth part of Bishop Colenso.

T. K. CHEYNE.

**Explanation of the Old Testament.** [*Beiträge zur Erklärung des Alten Testaments*, enthaltend elf Abhandlungen, exegetisch, kritisch und historisch behandelt von Laur. Reinke. Achter Band.] Giessen: Roth.

As contributions to the study of the Scriptures, this work has two distinctive features entitling it to notice. It is true that it appears at least thirty years too late to exert any influence on the current of critical opinion. Controversy has passed into a new phase, with which, in spite of one or two references to Graf, Dr. Reinke is evidently not familiar. But as a tacit protest (the more valuable as coming from a Roman Catholic) against the *odium theologicum*, and as a specimen of true scholarly work in a modest but very necessary sphere, we can conscientiously recommend the book. Omitting the dissertations on the Sabbath, on Gen. i. 1, on the Cherubim, on the history of Manasseh, on the "Book of the Law" found under king Josiah, on the standing still of the sun and the moon, on Prov. xxiv. 16, and on Melchizedek, the reader may consult with profit the fourth, "On the pretended alteration of the Masoretic text, Isa. xix. 18," in which Dr. Reinke maintains the received reading, and renders "City of destruction" (of idolatry); the seventh, "On the causes of the difference of the ancient interpretations of Isa. xvi. 1, Ps. xci. 6, and cx. 3;" and the eighth, "On the variations of the ancient versions in some other passages of the Psalms." Dr. Reinke opposes the view of Geiger, which has been gaining ground among some Protestant critics, that the Masoretic text has undergone deliberate falsification. Without any pretence of brilliant discoveries, he has performed a useful work in restoring the readings or misreadings of the Hebrew exhibited by the versions. We will only regret that he has not paid more attention to Hebrew palaeography, as a means of accounting for the growth of various readings.

T. K. CHEYNE.

**St. Thomas of Aquin: His Life and Labours.** By the Very Rev. Roger Bede Vaughan, O.S.B. Two Volumes. Hereford: Hull, late Head, 1871-1872.

THE controversy on the Origins of Christianity shows signs of being exhausted if not decided soon, for the same limitations in the materials which prevent the contest from coming to an issue will at last prevent its going on at all. When

this point is reached, if not sooner, criticism will be forced to return to an examination of the contents of theology as it appears at its full development. As there is more than one point of view in which orthodox theology may be said to culminate in the great constructive movement of the thirteenth century, we are inclined to welcome any introduction to this period, and to its great central monument, the *Summa Theologiae*. For it cannot be denied that an introduction was wanted, at least in England, when the great English historian of Latin Christianity frankly confesses that he had never once read the masterpiece of Latin theology through. His sketch of the subject is not unworthy of it; but, as might be expected, he does not avoid serious misrepresentation of the Angelic doctor. Dr. Vaughan's book is written with two objects: it is intended both to present a picture of the saint and to serve as an introduction to his works. For the latter purpose the book is provisionally useful, and we congratulate the writer on this qualified success: his work ought really to be tried by the standard of a fifteenth-century edition of a classic, and tried by this standard it is really creditable; though the plan is decidedly better than the execution. There is no other book in English to which the reader could be referred for a conspectus of the speculative movement of the twelfth century, of the text-books in use, and the like, or again of the points at issue between the mendicants and the university. We do not think that Father Vaughan states the last question accurately; but at least he has the merit which Mr. Mill has recognised in Mitford's *History of Greece*: he puts his error into a shape in which it can be understood and discussed. The existence of monasticism was not at stake: what was really at stake was its influence and authority in the world. The expulsion of the regulars from Paris would have been an anticipation, not of the suppression of the monasteries, but of the suppression of the Jesuits, and even here the anticipation would be on a very small scale. This mistake prevents the writer from perceiving the strength of William of Saint Amour's case upon purely Catholic grounds. Perhaps the victory of the regulars may have postponed that revolt of the intelligence of Europe which began in the fifteenth century and was consummated in the eighteenth, but it certainly secularised the regulars themselves. Dr. Vaughan is happier in seizing the character of the revolt which was suppressed. No author has brought into such relief the strange combination of astonishing vigour and utter emptiness in Abelard, who is claimed, with reason, as a perfectly sincere though vain and presumptuous Catholic. In St. Bernard and Abelard the antithesis between monasticism and scholasticism reaches its climax; in St. Thomas the writer finds the synthesis of the two of which there had been a brilliant adumbration in the occasional writings of St. Anselm. This synthesis is the governing thought of the book, and the writer is carried away by it. In his enthusiasm he constantly allows himself to mistake insistence for development, and becomes tedious without ceasing to be incomplete. For instance, he devotes a great part of his second volume to the relation between St. Thomas and the doctors of the primitive Church. The comparison is perfectly relevant. St. Thomas stands in much closer relation to the fathers than a thinker like St. Anselm, or a thinker like Duns Scotus; but it is hardly the beginning of an explanation to assure us repeatedly that the monastic spirit was common to all. In fact, Dr. Vaughan is so inflated with the grandeur of his subject that he has written a book which, with some of the merits of a voyage of discovery, has all the pretensions of a monumental work. These are the more ungraceful for being combined with the *naïvetés* of childlike fervour and the crudities of an able

man who has put off writing too long. It is unnecessary to add that the author sees nothing of the imperfections of the great works written when every book had to be a library; that he is never weary of vaunting "the Angelical's" superhuman memory in spite of the fact that the industrious piety of the Venice editors continually fails to verify the references of the saint; that he has no eyes for the grotesque and arbitrary nature of the materials which made up the staple of the traditional thought of the middle ages; and that it never occurs to him that much which his hero laboured to defend was in itself purely accidental, and derived its only permanent value from the ideal reasons which he invented for its protection against the frivolous criticism of an inconsequent dialectic. When we have made these allowances, and all the allowances that can be demanded by a world which is old enough to have a right to be fastidious, the *Summa* will still remain one of the books which impress us most strongly with the wisdom of their author, in Joubert's sense of wisdom, "rest in light." Of course the greatness of such men as Spinoza or even Butler depends upon their method and their point of view; it is not to depreciate them to say that the matter of the *Sermons* and of the fourth and fifth book of the *Ethics* is continually contained and transcended in the *Prima Secundae*, but the statement may serve to give some measure of the intellectual range of Aquinas. He lived for his work, and he died in it; like Socrates, his concentration of thought was so intense as to pass into long trances, from which he had to be roused by shaking his *cappa* to recall him to sublunary things. As he grew older, the trances became longer, more frequent, more ecstatic; at last he could write no more: all that he had written seemed to him mere straw in comparison of that which had been shown: in one sense, he had broken down under his work; in another, he had risen above it. Dr. Vaughan's account of the closing scene is so beautiful as to make us regret that he has so often buried the human element of the life under a mist of second-hand panegyric, where translations from papal bulls and quotations from dull Tridentine doctors figure oddly enough between historical pictures after the Dean of Westminster and less infelicitous echoes of the least severe manner of Newman. G. A. SIMCOX.

### Intelligence.

It gives us much pleasure to notice that the vacancy caused at Tübingen by the death of Oehler has been filled up by the nomination of Prof. Diestel, of Jena.

A correspondent proposes to remove the obscurity of Ps. cxxxvii. 5, by giving תשכח the sense of תשכח. He will find that he has been anticipated by Schlesinger in Cahen's French Bible, who renders "qu'elle s'engourdisse." The Targum would seem to have read תשכח, which is at any rate more defensible palaeographically than Dr. Weir's ingenious emendation in No. 49. נ and נ are easily confounded in the archaic Hebrew alphabet; cp. Jer. iii. 8, Ezek. xxiii. 13, Ruth iv. 4, Exod. xx. 24 (unless the Masoretic reading אֲזִכִּיר is directed against the worship at the high places).

Dr. Geiger points out (*Jüd. Zeit.* 1872, pp. 133-136) that Prof. de Lagarde's conjecture in the *Academy* (vol. iii. p. 12) is really a development of some remarks by himself in the German *Oriental Zeitschrift*, 1867, p. 469, &c., and by Prof. Bickell in his *Conspectus of Syriac literature*. If however acrostics were really employed by psalmists, he remarks, we should certainly find them in the oldest liturgical passages of the Jews, whereas these are only distinguished by alphabets. Acrostics do not appear before the ninth century.

### New Publications.

BAUMSTARK, C. E. *Christliche Apologetik auf anthropologischer Grundlage*. 1. Band. Frankfurt a. M.

STRACK, Dr. *Prolegomena critica in vetus Test. Hebraicum, quibus agitur (1) de codicibus et deperditis et adhuc exstantibus, (2) de textu Bibliorum Hebraicorum qualis Talmudistarum temporibus fuerit*. Fasc. primus. Leipzig.

### Philosophy and Physical Science.

*La Morale nella Filosofia Positiva*. Studio critico di Giacomo Barzellotti, Professore di Filosofia nel R. Liceo Dante di Firenze.

S. BARZELLOTTI'S title is likely to mislead English readers, as the "morale" of which he treats is not that of Comte, with which he does not seem to be familiar, but English utilitarianism, in connection with the empirical psychology which may be considered the reigning school of philosophical thought in our island. His choice of a title is partly due to the loose notion attached to the term "positivism" in Italy. Never was there a movement of ideas, our author informs us, more wanting in consciousness of its own tendency and in vigorous criticism. It is a school formed of the *débris* of old philosophies, under the strong but indefinite impulse of the general liberal movement of Italian society, in which Comte and Littré, Büchner and Moleschott, Mill, Bain, and Spencer, are quoted as concordant authorities. "Discordi in ogni cosa, fuorchè in negare ciò ch'essi chiamano teologia e scolastica (e la sognano dappertutto), quando si chiede loro chi affermino un'opinione, una dottrina qualunque, allora ci si rivelano inconsapevolmente materialisti, egheliani od empirici, tutto in una parola fuorchè positivisti conseguenti." This confusion of methods (to which we could find a pretty close analogue in England, only that we do not usually call the motley result "positivism") S. Barzellotti has proposed to remedy by a careful study of the "English positivists," especially Messrs. Mill, Bain, and Spencer, who alone, he says, follow a path "che può condurre il positivismo a produrre quel più di cui è capace." This path is the application of the positive method to subjective psychology, which may be regarded as peculiarly English; for M. Taine, as S. Barzellotti says, may be considered to belong to the English school. "Mentre il Comte si sbarrava da sè la via maestra della scienza, l'osservazione subbiettiva, e i Tedeschi per troppo trascenderla ne compromettevano i risultati più certi, e gl'Italiani, intenti a ricostituirsi in nazione, non avevano la forza di mandare innanzi di concerto psicologia e metafisica, gl'Inglese accettavano dalla Francia la parola d'ordine della ricerca positiva, ma in omaggio a un'antica tradizione salvavano la psicologia dal naufragio delle dottrine filosofiche." We have then in the volume before us a careful study of this line of English thought, especially in its ethical development, by a critic at once hostile and favourable: hostile, as belonging to an opposite school, but favourable in so far that he is perpetually led to praise the English writers, in contrast to their continental analogues, for moderation, subtlety of analysis, and patient fidelity of observation.

Our author's reading in English philosophy has been considerable, and the general views and criticisms which he gives us are close and definite, and always instructive, even where they involve misapprehensions. Indeed, he seems to grasp more clearly and completely than most English antagonists the peculiar position of the Associationist psychology; and he describes the distinctions and mutual relations of the different writers with much subtlety and delicacy of apprehension. And for the not unfrequent errors in detail which I have to notice in his work, there are two kinds of excuse. Firstly, the disposition, at once excellence and defect of English philosophers, to sacrifice systematic coherence to fidelity of reflective observation, makes the historical study of them peculiarly complicated and perplexing; and, secondly, such a historical study is at present in the most rudimentary and imperfect condition among ourselves. We cannot perceive without some sense of shame that some of the most serious of S. Barzellotti's blunders may be traced to English writers of repute. To

Mr. Lecky, I think, he chiefly owes the most fundamental of all: the confusion of egoistic and universalistic hedonism under the common term of utilitarianism, which continually vitiates his historical *aperçus* and causes his criticism to miss the point. If anyone understands the ethical controversy that extends from Socrates to the present time as a dialogue between *two* schools of thought, "Intuitivist" and "Utilitarian," and so considers the difference between Epicurus, Hobbes, and Helvetius, on the one hand, and Bentham and Comte on the other, as quite secondary and subordinate, he misses the true clue for tracing the progress of moral thought generally, and is especially liable to misapprehension in following the complicated and varied portion of the controversy that has been carried on in England since Hobbes. The truth is that utilitarianism in the Benthamistic sense, the system which fixes as the right end of human action the "greatest happiness of the greatest number," does not originate (in England) with Hobbes, but with his antagonist Cumberland; and was for some time in friendly alliance with the intuitionist method as represented by (e.g.) Clarke. Butler was the first to point out clearly the at least apparent discrepancy between Virtue (as commonly understood) and the general happiness. In Hume's hands, utilitarianism, presented as a mode of *explaining* morality, was felt to have a destructive tendency and fell under suspicion; but it was not till Bentham that it was offered as a method for determining conduct, absolutely complete in itself, the conclusions of which were to overrule all traditional precepts and supersede all existing sentiments. Herein lies the originality of Bentham, which our author quite misses. Of this, perhaps the blame is partly due to Dumont (through whom Bentham is generally known on the continent), who, though an excellent populariser of the system in its political and social development, blunders sadly when he tries to expound its ethical principles. Again, S. Barzellotti's neglect of Shaftesbury, perhaps the most important of the different turning-points in the course of English ethical thought, may be referred to his study of Professor Bain's Ethical Systems. In regarding Locke (who held that ethics, by a steady contemplation of the relations of its fundamental notions, might and ought to become as perfect a science as geometry) as an adherent of "l'Etica sperimentale," he only endorses an almost universal error: but one is curious to ascertain how he comes to class Mackintosh with James Mill, and to say that ethical enquiry "... nello Stewart ... si restringe al sentimento e perde di vista la ragione."

These latter mistakes, however, are unimportant, except as illustrating the difficulty of gaining at second-hand an accurate knowledge of the English moralists. But the whole work is pervaded with the misapprehension of Comte's relation to the English writers criticized, which the title indicates. This misapprehension is double, and in two opposite directions. On the one hand, S. Barzellotti overrates the amount which our school owes to the French thinker in respect of method. It is not that he is insufficiently acquainted with the lines of English thought before Comte with which the speculations of Mill, Bain, and Spencer, are naturally connected; he himself points out and characterizes this connection, and admits that the English have a certain right to repudiate the title of being adherents of Comte. But he seems to refer to Comte the impulse which caused phenomenalism (as for clearness' sake I prefer to call it) to pass from the purely critical attitude which it presents in Hume to the comprehensive construction at which it aims in Mill, Bain, and especially Spencer. Now it is impossible ever to estimate exactly the influence of any thinker on his contemporaries; but it may safely be said that, if we ignored

Comte altogether, and considered the above-mentioned writers in relation to their English antecedents only, we should not find in them any unnatural and inexplicable originality. If we confine ourselves to empirical psychology, with which our author is especially concerned, we find that the most important step had been taken by James Mill and Brown; all that their successors had to do was to advance further on lines of thought clearly marked out, with a more conscious and reflective application of the method of physical science, and availing themselves more of the aid of physiology. Nor again is the Neobaconian logic of Mr. Mill less essentially English, in the main, than his empirical psychology. It is almost solely in his sixth book when he comes to apply his logic to the moral sciences that the influence of Comte becomes prominent.

But it is precisely this side of Comtism that our author almost ignores. That his acquaintance with the "utopia positiva" is not close may be inferred from his assertion that it was nearly being realised in Paris under the Commune: and again from his praise of Mill's moderation in repudiating Comte's "*principii eccessivi della riforma civile*" (!). Hence, when he pronounces that "*niuno indagine morale, degno di questo nome, può trovar luogo nelle dottrine positive di Francia*," we perceive that this judgment is founded entirely on *à priori* arguments. And these arguments have much force: only they really tell against Comte's methodical consistency. A strictly "objective" study of mankind as a collection of organisms placed in certain temporal and spatial relations to each other, mutually dependent for their preservation, but occasionally acting on each other destructively, affords no basis for any systematic direction of conduct. But Comte's objective psychology does not exclude notions whose content belongs entirely to introspective observation: it only insists on employing them uncriticized, just as the unreflective mind furnishes them. And so his sociology deals throughout with facts not expressible in terms of matter and motion: facts that have indeed an objective aspect, but a very obscure one, and whose significance is entirely subjective: as, e.g., the law of the three stages of belief. Hence Comte's exclusion of empirical psychology does not prevent him from having a characteristic and coherent view of ethics: it only gives his utilitarianism an unreflective, unanalytical stamp. At the same time, by not taking the attitude of introspection, he naturally relieves himself from the necessity of reckoning with the claims of the egoistic reason, which become prominent in this attitude. It is interesting in this aspect to compare him with Bentham. Both thinkers take universal happiness as the end of human action: but when the individual's Practical Reason demands from Bentham a demonstration of his end, he ignores its *rationality* and labours to provide the individual with motives instead of reasons: while Comte ignores its *practicality*, and offers historical and phrenological reasons which are not to the point. It would have been well if S. Barzellotti had noticed this: because his chief criticism is directed to Mill's Utilitarianism: and the perplexed and perplexing character of this is due to the effort to combine the self-sacrificing sociality of Comte with the socialised selfishness of Bentham, and yet to answer the question which both evade. The moral man of Mill is to be "disinterested" like Comte's: yet he is to be controlled entirely by "sanctions" (pleasures and pains) like Bentham's: at the same time an attempt is made to demonstrate to his reason that universal happiness is the true end of action. S. Barzellotti criticizes closely some of the weak points in this composite result: but he misses the full explanation of them to which his line of study should have led him. He notices Mill's confusion of rational and emotional elements in moral action, or more particularly

of the dutiful and sympathetic impulses, which have a phenomenal distinctness undeniable on any system. And he argues effectively against the contemptuous treatment of the question of the objectivity of moral rules, as belonging to transcendental metaphysics and practically indifferent: whereas it is a fact of inner experience that on the belief in such objectivity depends the force of the moral impulse to obey them; in so far as strictly moral. Nor is his assumption that "il bene dell' individuo" is "mossa inevitabile dell' utilismo" unwarrantable as regards Mill, though it leaves Comte out of sight; but he does not unravel the curious intrication of methods by which Mill passes from the individual to the universal good.

His attack, however, is principally directed against the psychological rather than the strictly ethical theory of the Associationist writers: that is against their "reduction" of the free choice of good which moral action implies to completely determined pursuit of pleasure and avoidance of pain. His argument is divided into parts, each of which is given separately: the first considers the question of Freedom and Determination apart from the direction of voluntary effort: the second concerns the possibility of exhibiting the impulse towards virtue as a complicated and peculiarly modified case of the natural and universal tendency to seek pleasure. In both parts his reasoning is careful and intelligent: but in neither does it go precisely to the point. He thinks that Mill fails to discern the quality of freedom in volition, because he restricts introspective observation to *past* phenomena, represented in memory: but the point of Mill's argument is that freedom, implying the ability to do something other than we actually do, is intrinsically incapable of being immediately observed: we can only be conscious of actualities, not possibilities. Nor, in discussing the Associationist derivation of virtue, does our author fairly meet the analogy to which Mill's term "mental chemistry" appeals. He merely asserts that the aggregation of phenomena of one kind (sensations active and passive) cannot account for the existence of a phenomenon qualitatively or (as he says) *formally* different: but what the Associationists contend is that the difference is only apparent, as the difference between a compound and its elements in material chemistry. We all agree that the elements of a salt, &c. are present in the compound substantially the same, though changed in form; so, it is maintained, are the complex and derivative phenomena of mind *substantially* identical with the simpler and more elementary.

As I have been forced to dwell chiefly on what have appeared to be mistakes and misapprehensions in S. Barzellotti's treatise, I must conclude by saying that it is, in spite of them, throughout instructive, interesting, and well written.

H. SIDGWICK.

### Notes of Discoveries and Scientific Work.

#### Geology.

**On the Geology of the Eureka Settlement in Nevada.**—At the Academy of Sciences of California, Prof. Whitney exhibited a collection of fossils formed by Mr. J. E. Clayton in Nevada, near the 116th meridian, and not far from the mining settlement of Eureka. These fossils are of great interest, in that they represent the primordial or Potsdam beds of the Silurian era, and exhibit the same combination of genera and species of the *Lingulidae* family of the Brachiopods and the *Paradoxidae* family of Trilobites which characterize this group farther east. The same *Agraulos* (*Arionellus* of Barraude, and *Crepicephalus* of D. Owen, Meek, and Hayden) which occurs in the Big Horn Mountains, near longitude 167° is found in this collection from the 116th meridian. There is also a *Conocoryphe* (*Conocephalites*), but *Agraulos* is most abundant. The brachiopods appear to be represented by at least two genera, *Lingulepis* (*Lingula*) and *Obolella*. The lithological character of the rock in which these fossils occur is likewise of importance, as it is not a sandstone, but a limestone.

**The Muschelkalk of the Eastern Alps.**—There has hitherto existed a wide gap between the Muschelkalk of the Alps and Germany as regards their palaeontological features. E. von Mojsisovics (*Verhandl. der k. geol. Reichsanst.* 1872, No. 9, 191) has recently made the interesting discovery of a rich Cephalopoda fauna in the Lower Muschelkalk of Monte Cucco, near Friaul, in the Alps, containing new forms of Ammonites, though the greater part are closely allied to the species of North Germany occurring in the Lower Wellenkalk, such as varieties of the species *Am. Ottonis*, v. Buch, and others. It is remarkable that this newly discovered horizon of the *Am. Balatonicus*, which is a variety of *Am. Ottonis*, has also been found in Hungary in the Bakonyer Wald, a continuation of the Alps to the eastward, where it falls below the niveau of *Arcestes Studeri*, and rises above the beds of the *Rhynchonella decurdata*.

**Nummulitic Limestone from the Neighbourhood of Modena.**—G. Mazzetti publishes in *Extr. dall' Annuario della Società dei Naturalisti* (Modena, 1872), thirteen new fossil species from the nummulitic limestone of Montese, near Modena. In the marly variety of the limestone, there are *Marginella*, *Mitra Michelotti*, *Terebellum*, *Cassia variabilis*, *Natica mammillaris*, *Pechiolia argentea*, and others; and from the hard limestone were obtained *Avicula*, *Cardium*, *Terebratula Montesi*, *Schizaster canaliferus*, and two Echinodermata of the family of *Cidaris*.

**On Atolls or Lagoon Islands.**—At the meeting of the Geological Society of London on 8th May, S. J. Whitnell endeavoured to show that the areas of atolls are not at present sinking, and referred to an instance, that of Funafuti or Ellice Islands, where he thought signs of a slight upward movement could be traced. He called attention to the occurrence of furrowed appearances or a series of ridges or mounds in some islands, and attributed them to the action of a single gale.

**The Glacial Phenomena of the Yorkshire Uplands.**—At the same meeting, J. R. Dakyns stated that in Derbyshire and Yorkshire, south of the Aire, there is no glacial drift on the eastern slope of the Pennine chain, except where it is broken through by the valleys of the Wye and of the Aire and Calder. The basis of the Aire and the country northward is thickly covered with drift, which contains no rocks foreign to the basis, and thus points to formation by local action. The author ascribed this to the glaciation of the country, partly by glaciers, and partly by a general ice-sheet. Evidence of the latter he finds in the fact that drift occurs only on one side of the valleys, namely, on the leeside of the hills with respect to the source of the drift material. The action of glaciers may be traced in the great amount of scratched and rounded pebbles in the mounds of drift, which increase with the distance from their source, the presence of vast piles of drift at the junction of valleys, due doubtless to the shedding of the lateral moraines of two glaciers, and the existence of mounds of pebbles and of an alluvial deposit wherever a rock-basin crosses a valley. The Kames or Eskers, which are frequently met with in the valleys, he ascribes to the deposition of moraines in the sea instead of on land.

**A Boulder Clay Section in Cheshire.**—At the same meeting, D. Mackintosh directed attention to the occurrence of numerous sea-shells in a bed of Lower Boulder clay at Dawpool, of as completely glacial appearance, structure, and composition as any clay to be met with along the shores of the Irish Sea, and differing in no essential respects from the Pinel, which runs up the slopes and valleys of the Lake district. He pointed out a number of very important distinctions between the Lower and Upper Boulder clays of Cheshire, referring especially to the light grey or blue facings of the latter beds, and gave a list of a number of large boulders, greenstone and Criffell granite predominating, among the smaller stones Silurian grit being most prevalent. The author likewise explained the mode of striation of the stones found in the clay, and the position they occupied in reference to their flattened surface.

**Notes on the Peninsula Mangischlak and the Aleutian Islands.**—Dr. E. von Eichwald has published an interesting volume, entitled *Geognostisch-paläontologische Bemerkungen über die Halbinsel Mangischlak und die Aleutischen Inseln* (St. Petersburg, 1871). On the peninsula of Mangischlak, in the Caspian Sea, are found Lias and Middle Oolitic strata and several horizons of cretaceous age. The coal-beds of the peninsula are connected with strata which contain the *Am. Parkinsoni*, and the cretaceous strata are especially rich in fossils. In respect to the volcanic islands of the Aleutian archipelago, the author is of opinion that they are stratigraphically connected with the peninsula of Alaska, in common with which they have exhibited a slow movement of upheaval. Besides crystalline schists, numerous eruptive rocks of the trachyte and basalt groups have been noticed. Fragments of *Lichas* make the occurrence of the Silurian form probable. Other doubtful Palaeozoic deposits are mentioned, and some Neocomian beds described.

**On Fossil Apes.**—In *Extr. delle Atti della Società italiana di Scienze naturali*, vol. xiv. fasc. xv. 1872, C. J. F. Major gives a digest of what is at present known respecting fossil monkeys, from which we gather that at present nineteen species have been determined. Of the

sub-order *Lemuridae*, there are no fossil representatives, though the Eocene genus *Caenopithecus* forms a link between the *Lemuridae* and the *Simiadae*. The *Arctopithecini* are represented in the Brazilian caves by two species of *Tacchus*. The remainder of the cave-species of Brazil belong to the *Platyrrhini*, and all the other fossil monkeys are *Catarrhini*. The *Cynomorpha* are represented by three to four species of *Semnopithecus*, three species of *Macacus*, and one species of *Mesopithecus*; the *Anthropomorpha* are represented by four species, of which three belong to the genus *Hylobates*, and the fourth is allied to the orang-outang.

**On the Gasteropods of the Miocene and Pliocene Formations of Modena.**—Professor F. Coppi has just published in Modena a monograph on the Gasteropoda of the Miocene and Pliocene beds of this province, and describes in this most important work eighty-three species of the families of the *Dentalidae*, *Caliptraeaceae*, *Tubispiratae*, *Turritellidae*, *Tornatellidae*, *Bullaceae*, *Solariidae*, *Turbinaceae*, *Xenophoridae*, *Naticidae*, *Cancellariidae*, *Cerithiidae*, *Muricidae*, *Conidae*, *Ficulidae*, *Chenopidae*, *Cassidae*, *Buccinidae*, *Olividae*, *Cypraeadae*, and *Volutidae*.

### Botany.

**The Leaves of Drosera.**—M. Ziegler has contributed to the Académie des Sciences de Paris (*Congrès rendus* for May 6) a series of observations on the irritability of the leaves of the sundew (*Drosera*). He finds that the hairs on the leaves exude from their extremity a small drop of glue, by which insects are caught. After an insect becomes attached, the exterior threads bend over it, covering it like the fingers of a hand, and do not straighten again till some days after, when a fresh drop exudes for a fresh prey. Albuminoid animal substances, if held for a moment between the fingers, acquire the property of making the hairs of the *Drosera* contract; except by contact with a living animal these substances exert no action on the hairs; and they lose their singular property by being repeatedly moistened with distilled water, and dried each time in a water bath. In order to prove that the contraction of the hairs is not caused by animal heat, the substance was cooled before placing it on the leaf. The sensitiveness of the hairs disappears after repeated application of the albuminoid substance, and their properties then appear to become reversed, showing similar sensitiveness to sulphate of quinine, which again restores them to their original condition of sensitiveness to insects after application for a sufficient length of time. In all cases the contraction of the hairs is slow, commencing visibly in about a quarter of an hour, and is often not completed till after several hours.

**The Marine Algae of St. Helena.**—In the last number of the *Journal of the Linnean Society* (No. 67, May 29) is a list, by Dr. Dickie, of the seaweeds of the island of St. Helena. The number is only eighteen, including one representative of the olive, thirteen of the red, and four of the green series; with three exceptions, they are very dwarf. When the very remarkably endemic character of the original land-flora of the island is considered, it is very singular that, with two doubtful exceptions, there is not a form of marine plants peculiar to the island; all are species more or less widely diffused, and most of them occur on both sides of the equator. About one-half are Cape forms, and one is Australian. The total number is very small for an island ten miles long by seven broad. The island of Kerguelen, much farther removed from any continent, has thirty-nine species, eight being olive, nineteen red, and twelve green; and of these five are, as far as is known, peculiar to the island, all the others being derivative; and, like those of St. Helena, many of them have a wide distribution in both hemispheres; a few are South American species.

**The Flora of the Island of St. Paul.**—The volume of the *Verhandl. der zoologisch-botanischen Gesellsch. in Wien* for 1871 contains an account of the flora of the island of St. Paul, in the Indian Ocean. There is a long list of marine Algae, and a few Lichens, Hepaticae, and Ferns; but the number of flowering plants recorded is only nine, constituting, probably, the poorest phanerogamic flora in the world. Of these, six are grasses, one a sedge, there being besides a *Plantago* and a *Sagina*; the two latter only are new and undescribed species. As the seven remaining species are all widely distributed plants, one at least being European, and are among those most easily propagated involuntarily by human agency, they have most probably been introduced. The number of flowering plants actually native is thus in reality reduced to two.

**Effects of the Eruption of Vesuvius on Vegetation.**—Sig. G. A. Pasquale contributes to the *Accademia delle Scienze fisiche e matematiche* of Naples a paper on the effects of the recent eruption of Vesuvius on the plants in the neighbourhood, of which the following is a *résumé*. The newest vegetation has suffered from contact with the ashes, though the effect has been neither a scorching nor drying-up. The action has not been a mechanical one, for a mere closing of the pores of the epidermis could not have caused death in so short a time. The closing of the pores and stomata undoubtedly produces a secondary effect, but

only after the lapse of some days. No change has been observed similar to that produced by the vapour of boiling water. The action of a high dry temperature occurs only in places in the immediate vicinity of Vesuvius. Neither an acid nor an alkaline reaction is shown by any change of colour, except a few instances of a change to blue of rose, orange, or violet coloured organs, which might be attributed rather to an alkaline than an acid reaction; but these are few and doubtful. Many phenomena concur in pointing to chloride of sodium as the chief agent in the destruction of vegetable tissue. The salt was present in sufficient abundance in the falling ashes to be readily discernible to the sight, and is also met with as an efflorescence on the ashy soil.

**Structure and Source of the Wax of Plants.**—Prof. de Bary publishes a paper on this subject in the *Botanische Zeitung*, thence abstracted in *Nature*. The wax does not appear to be a simple coating on the surface, and to form a continuous layer, as though laid on with a brush. It is found to be a dense forest of minute hairs of wax, each having one end on the epidermis, the other either rising straight up or rolled and curled amongst its neighbours. This matting of the waxen hairs is often sufficiently dense to give the surface, when viewed by the microscope, the appearance of a continuous layer, though a good section of the leaf or skin of the fruit indicates its true structure. The question as to what part of the epidermis or subepidermal tissue forms the source of the wax is most beautifully and clearly answered. Prof. de Bary states that it is impossible to discover the slightest trace of wax in the cell contents, or to entertain the theory that chlorophyll is partly made of wax. The locality in which the wax can first be detected is the cuticle and the cuticularised elements of the epidermis cells.

### Physiology.

**The Functions of the Laryngeal Nerves.**—Dr. Navratil, the author of a paper in the *Medical Times and Gazette* for June 15, draws the following conclusions from his experiments:—1. The *N. laryngeus superior* has no influence whatever on the motory sphere of the larynx. 2. The *N. laryngeus inferior seu recurrens vagi* is the nerve which supplies the muscles of the larynx; the expanders, contractors, and dilators of the vocal cords are under its influence. Hence any interruption of the functional powers of this nerve causes paralysis of the corresponding half of the larynx. If both recurrences are interrupted in their functions, all the muscles of the vocal cords become inert, and the vocal cords assume the position seen after death. 3. The *N. accessorius Willisii* has no influence whatever on the muscles of the larynx. 4. The division of the vagi is attended with fatal consequences; but an animal may live for some time after the division of the recurrences. Hence they conclude that the assertions of Claude Bernard, according to whom the *N. accessorius Willisii* over the jugular foramen might lead one to conclude that the nerve inoculated with the motor fibres of the vagus nerve at that point, and that the observed paralysis of the glottis contractors was rather to be ascribed to this circumstance; whilst in their experiments Willis's nerve was divided in the spinal canal, consequently before any commixture took place.

**The Antagonism between the Actions of Physostigma and Atropia.**—A long and valuable paper, with this heading, by Dr. T. Fraser, appears in the third part of vol. xxvi. of the *Transactions of the Royal Society of Edinburgh*, which has just been published. Two or three instances of antagonism have already been traced, notably that between the lethal action of prussic acid and the physiological action of atropia, and that between the lethal action of muscaria and the physiological action of atropia. The physostigma examined by Dr. Fraser is well known in ophthalmic surgery as Calabar bean, and its active principle, eserine or physostigma, possesses the remarkable power of contracting the pupil, whilst atropia, the active principle of belladonna, produces wide dilatation. Dr. Fraser experimented with rabbits and dogs, and used an alcoholic extract of the bean, the base having been converted into a sulphate by the addition of dilute sulphuric acid. This was so potent that 0.12 of a grain was sufficient to kill a rabbit weighing three pounds. Experiments made with sulphate of atropia showed that from 20 to 24 grains were required to kill a rabbit weighing three pounds. In both instances the solutions were applied by subcutaneous injection. To show the antagonistic action of sulphate of atropia to physostigma, a small quantity of atropia, 0.17 of a grain, or from that quantity to 0.5 of a grain, was injected beneath the skin, and, after a few minutes had elapsed, a poisonous dose of the physostigma was injected. Symptoms usually made their appearance indicating the toxic influence of both drugs, but after a time the animal recovered. After the lapse of some days, when it was quite restored, the same quantity of the extract of physostigma was injected without any atropia, and it was usually found that the animal died. It is thus incontestably shown that atropia exerts a powerful counter-acting influence to the lethal action of physostigma. Further experiments showed that whilst  $\frac{1}{4}$  of a grain of sulphate of atropia is too small a dose to prevent death after a dose of physostigma one and a half times as large as the minimum lethal amount,  $\frac{1}{8}$  of a grain is suffi-

ciently large to do so, and that doses of sulphate of atropia ranging from  $\frac{3}{16}$  of a grain to  $\frac{4}{16}$  grains are able successfully to counteract this dose of physostigmia; on the other hand, death occurs when the dose of sulphate amounts to  $\frac{4}{16}$  grains. This effect can be explained by supposing that there are certain actions of both physostigmia and atropia which do not counteract one another, but whose sum exerts a fatal influence. Similar experiments were made with different proportions of the two drugs, and the results are given very clearly in a diagram.

**The Influence of Respiration on the Circulation.**—In a paper on this subject by Dr. Ewald Hering (contained in vol. lxiv. of the *Sitzungsberichte* of the Vienna Academy, and republished by Stricker in the current part of the *Medizinische Jahrbücher*) are given the results of a considerable series of experiments on dogs, undertaken with the view of determining the influence of respiration on the circulation. He states that during an examination of the influence of the vagus on the respiratory movements, he found artificial inflation of the lungs to exert a remarkable influence on the cardiac movements. If air be blown in through a canula, and its escape prevented by a stopcock, the beats of the heart increase in frequency. In his experiments he introduced one end of a T tube into the trachea, and attached a second orifice to a manometer, while the third was left free, so that the animal might breathe by it, or through it insufflation might be carried on; a manometer was also introduced into the carotid. It was found that, when the tension of the air within the lungs was augmented, the pressure of the blood in the arteries fell to an extent increasing in proportion to the pressure of the air in the lungs. This effect is obviously due to the greater resistance the blood experiences on entering the chest, and to the obstacle the expanded lung presents to the passage of the blood through its capillaries. The heart's beats increased in frequency at the same time, and in proportion to the tension of the air in the lung; where the cardiac movements had previously been slow, they sometimes rose to three times their previous number. The animals were always under the influence of opium. Four questions suggested themselves in regard to this increased frequency of the beats. 1. Is it due to the greater pressure under which the heart acts? 2. Is it owing to the altered conditions of resistance to the current of the blood? 3. Does it arise from disturbances in the exchange of gases; or 4. Is it occasioned by a forcible dislocation of the heart. He considers the arguments in each case at length, and finally arrives at the conclusion that the acceleration of the cardiac beats on insufflation of the lungs is affected reflectorally through the vagi; the action of the centres of the inhibitory fibres of these nerves being lowered by the excitation of the sensory fibres distributed to the lungs.

**Experiments on the Movements of the Uterus.**—Dr. Oser and Dr. W. Schlesinger, in a communication to *Stricker's Medizinische Jahrbücher*, Jahrgang 1872, part i.), give the following result of their enquiries: By suspension of the pulmonary respiration through rapid loss of blood from the system generally, or by arrest of the flow of blood to the brain, a condition of excitation is established in the brain which causes movements of the uterus.

**Detection of Syphilis by Examination of the Blood.**—A controversy conducted with considerable acerbity on both sides is now in progress at Vienna. Dr. Losterfer, who is supported by Professor Striker, maintains that peculiar corpuscles, which undergo definite changes, are recognisable by the microscope in blood that has been withdrawn from the patient, and kept a day or two with due precaution in moist air; that such is the case is strongly contested by Professor Wedl and others. Professor Stricker states in a paper contained in his *Jahrbücher* (Jahrgang 1872, part i.) that he furnished a considerable number of specimens of blood to Dr. Losterfer, some taken from syphilitic, some from non-syphilitic persons, and that, except when the preparation was spoiled before being kept the required length of time, Dr. Losterfer always, or almost invariably, detected those that were from syphilitic patients. Should this observation be confirmed by other enquirers, it will constitute an important step in pathology. Dr. Losterfer carefully abstains from stating that these corpuscles are the cause of the disease, and merely maintains that they constantly accompany or are associated with it.

### History.

- Lives of the Archbishops of Canterbury.* By W. F. Hook, D.D., F.R.S. Vol. IV. New Series. Reformation Period. Bentley and Son.

THE readers of Dr. Hook's *Lives of the Archbishops* had long been awaiting with more than ordinary curiosity the appearance of the last published volume, containing the life of Parker, nor will they on the whole be disappointed. Not indeed that there is much to interest or attract us about Parker himself personally, who was a conscientious, painstaking, methodical man, of good average abilities and considerable pertinacity, but wholly devoid of originality of mind or character, and with little enthusiasm. He is one of those safe and colourless characters who owe their place in history solely to the accident of position; and it is worth noting that his selection for the primacy was deferred—partly through his known reluctance for so perilous an eminence and partly through Elizabeth's anxiety to conciliate the Catholics—till after it had been offered to Dr. Wotton and probably also to Abbot Feckenham, who had been chaplain to Bishop Bonner, and refused by them. There is nothing about Parker of the zeal and vigour of Beckett, or Anselm, or Laud, and so little enthusiastic was he in the cause of the Reformation that, although deprived of his preferments under Mary as a married man, and perhaps also on account of his feeble complicity with the Northumberland plot, he remained otherwise unmolested through her reign, which Foxe naturally calls being cruelly persecuted. And this must have implied at least his outward conformity to the established worship, which we are told he "utterly disliked." He was, in short, a man with some of the weaknesses, but without the positive vices, of Cranmer, and of considerably more learning and sounder judgment. But the meritorious efforts of his biographer cannot rouse at best more than a very languid interest in Parker personally; the real importance of his life depends, of course, on the prominent part he was destined to play in the organization of the Anglican system. It was under his primacy, if not from his hand, that what came afterwards to be called the *Via Media* first took shape as a distinct scheme of eccle-

siastical doctrine and discipline; for the brief interlude of Edward's reign left no permanent traces behind it, except the doubtful legacy of two not very homogeneous Prayer-books, of which Elizabeth avowedly preferred the first, but eventually adopted the second, with some modifications, in deference to the Protestant or Puritan party, whom it was felt necessary to conciliate. It was, in fact, in Elizabeth's reign and during Parker's primacy that the English Reformation took place, so far as it can be assigned to any definite period and identified with certain specific acts; and it is, moreover, on the validity of his consecration that the Anglican claim to episcopal succession mainly hinges. On both grounds the history of his primacy has a critical significance for the ecclesiastical and the theological student, quite independent of the faults or merits of the man himself. And in this aspect only do we propose to consider it here.

Dr. Hook is careful to insist on the legal and historical continuity of the national Church before and after the Reformation, and it may at once be allowed, quite apart from the further question about validity of orders, to which we shall advert presently, that he is fully justified in doing so. There was certainly no legal break in the chain, and, except for the formal renunciation of papal supremacy, no profession of establishing the Church on a new basis, still less of establishing a new Church. The changes introduced in doctrine and worship were acquiesced in by the entire body of clergy and people, with a few insignificant exceptions: only the bishops for the most part stood out, but without attempting, like the Nonjurors afterwards, to perpetuate a separate succession. The *congé d'élire* for Parker's election, which speaks of the see of Canterbury being vacant "by the natural death of the most reverend father and lord in Christ, the Lord Reginald Pole, Cardinal, the last archbishop thereof," and provides for "another archbishop and pastor" being chosen in his place, contains no more hint of any transition from one creed or communion to another than the *congé d'élire* for any of his predecessors or successors. To say this is not to prejudice the theological issues involved, one way or the other. But the point is of considerable historical importance, and the author has done quite right in emphasizing it. His treatment of another cognate subject does not seem to us equally satisfactory. It is true, no doubt, that on Elizabeth's accession there was an extreme Protestant or Puritan party, greatly strengthened, if not created, by the suicidal severities of the former reign, while the immense majority of the nation was still Catholic at heart, though perhaps only a minority felt strongly about communion with the Roman see, and fewer still were prepared at all costs to adhere to it. But Dr. Hook's sharply defined classification of "Anglo-Catholics," "Romanists," and "Protestants," is surely an anachronism both in form and substance, and it is further complicated by his sometimes contrasting "Protestants,"—who are elsewhere termed "ultra-Protestants"—with "Reformers," such as Henry VIII., Elizabeth, and Cardinal Pole, while he sometimes uses the word Protestant, in a sense more analogous to what it bears or used to bear in Ireland, as synonymous with "Anglo-Catholic." Nor can we admit that the queen belonged to this middle party in any other sense than that she was ultimately driven into it by the impossibility, on the one hand, of conciliating Paul IV., and the consequent political necessity of coming to terms with the Protestant section of her subjects and the Protestant interest in Europe generally. Had Julius III. been still alive, or had Pius IV.—who was apparently willing even to sanction the Anglican Prayer-book, as it stood, on condition of his authority being acknowledged—succeeded a year earlier, she would almost certainly have retained the nation in com-

munion with Rome. The still more pronounced sympathy of Sixtus V. came a full quarter of a century too late. Her religious convictions, such as they were, were indubitably Catholic, but always held in subordination to her political interests and the impatience of foreign dictation which had been more or less characteristic of English sovereigns since the Conquest, and was hereditary in the Tudor line. But if Dr. Hook is arbitrary in his classification of parties, he is quite equally so in his estimate of their theological standard. The Protestant or Anglo-Catholic party, for instance, is said to have had no great objection to the mass, while unable to tolerate transubstantiation or the elevation of the host, which they considered idolatrous. Yet transubstantiation is just as much presupposed by the sacrifice of the mass as by elevation. The sacrifice is not a mere commemoration of that on the Cross, still less a repetition of it, but is identical with it. And unless the body of Christ is really there, it can as little be offered in sacrifice as become the object of worship. And what makes this confusion of thought the stranger is that Dr. Hook quotes at length in a later portion of the volume what he justly considers (*pace* the Judicial Committee) a very important letter of Bishop Gheast, the compiler of the Twenty-eighth Article in its present form, explaining it in a sense precisely accordant with the Tridentine doctrine of transubstantiation; "I said unto him, though he take Christ's Body in his hand, received it with his mouth, and that, *corporally, naturally, really, substantially, and carnally*"—the last term goes beyond the Tridentine statement, and looks almost like *σαρκοφαγία*—"yet did he not, for all that, see It, feel It, smell It, or taste It." In other words, the substance is changed, but the accidents remain.

There are other questions both of doctrine and fact which Dr. Hook seems only able to look at through strong Anglican, or, if he prefers the phrase, Anglo-Catholic, spectacles. Thus, to give one or two examples, he talks of "the Romanists," by which is meant Roman Catholics, "attributing to the Fathers the same kind of inspiration as was vouchsafed to the Apostles," a charge which might be more plausibly urged against some writers of his own school. The Council of Trent is oddly enough stated to have been "convened to define the faith according to the private judgment of the persons composing the assembly," as though such was its professed object. Still more oddly the want of learning among the mass of the Catholic clergy—which the Reformation, by the way did remarkably little to remedy—is ascribed to the time and mental energy absorbed by "a conglomeration of ceremonial details," as though the ritual of the mass, once mastered, had any more tendency to absorb and "dissipate the mind" than the rubrics of the Common Prayer-book, or as if Anglican services were not to the full as long and exhausting as those of the Latin rite. Elsewhere orders and marriage are called sacraments in the same sense as "the regal unction"! To speak again of "the Romish sect established in England by Cardinal Wiseman" consists as little with accuracy of fact as with the ordinary courtesies of literature, and is the language, not of historical criticism, but polemical spite. But a passing reference to such incongruities must suffice.

Considering its crucial importance to the claims of Anglicanism, we are rather surprised that Dr. Hook should have contented himself with so brief and unconnected a notice of the controversy about the Apostolical Succession, which he nevertheless designates "the fact which lies at the very foundation of the Church." All he has to say about it is comprised, with the admixture of several other matters, in the last fifty pages of a chapter nearly three times that length, and is chiefly to be gathered from the notes. He

may be right in opining that the dispute originated in ignorance or wilful misrepresentation, but at all events so vital a point, after being hotly contested for three centuries, requires not to be shelved, but to be settled. The objections to Parker's consecration may be summed up under three heads. There is first the question whether the alleged ceremony took place at all; secondly, whether the persons who took part in it were competent to convey the episcopal character; and, thirdly, whether they adopted the necessary means for doing so. On all and each of these grounds the validity of the consecration has been challenged.

1. The first objection may be most readily dismissed, for since Dr. Lingard's exposure of its "utter futility," no respectable controversialist would dream of maintaining the Nag's Head fable, first put forward in 1604, nearly fifty years after the event, in a work published by a Jesuit named Holywood, at Antwerp, and afterwards reproduced in five or six different versions. Suffice it to say here that there is overwhelming evidence to the issue of the *congé d'élire* for Parker's election, the royal assent to it, and mandate directed to seven bishops, ordering them, or any four of them, to confirm and consecrate him, to his confirmation by four of them on December 9, 1559, and his being publicly recognised as archbishop by the queen, and acting as such, on and after December 18, but not before. Dr. Lingard considers these facts alone conclusive as to his consecration on December 17, even were there no direct and positive testimony for it. But there is such testimony in abundance, quite independent of the authenticity of the Lambeth register, which, however, "there exists not the semblance of a reason," adds Lingard, for calling in question: and it is confirmed by the express assertion, frequently repeated both in public and private, of the Catholic Earl of Nottingham, who was himself present at the ceremony. The evidence for the fact will be found collected in the eighteenth chapter of Dr. Lee's learned and lucid work on the *Validity of the Holy Orders of the Church of England*, to which Dr. Hook is very largely indebted, though he has only once referred to it. We wish, by the way, that in citing Lingard's letter he had given it entire as it is given by Dr. Lee, instead of omitting, without any notice, paragraphs that offend him. It is on the second and third objections, and especially on the third, that the controversy really hinges. We cannot of course do more than very briefly summarise the salient points.

2. It is argued then, admitting the fact of the consecration, that Barlow, who performed it, had never been consecrated himself, and therefore had no power to consecrate others. To this there is a twofold reply. In the first place, allowing for argument's sake that Barlow was no bishop, the validity of Parker's consecration would not be prejudiced thereby. For the three who took part with him in the rite had unquestionably been consecrated—one of them, Hodgkins, according to the Sarum Pontifical—and it is equally certain that consecration conferred by a single bishop is *valid*, though, for greater security, the co-operation of three is required by canon law for its *regularity*. And if it is objected that the Anglican Ordinal does not, like the present Roman, direct the assisting prelates to pronounce the sacramental formula, so neither did the Sarum or York Pontificals, in use before the Reformation; but it is moreover expressly recorded that in Parker's case all four of them did pronounce the words. There is no real need however for dwelling on these points, for of the fact of Barlow's consecration there cannot be the shadow of a reasonable doubt. The indirect evidence for it is overwhelming, and the only shred of evidence to set against it is the omission of any entry in the Lambeth register, to which it is enough to reply

that the record of nine other consecrations performed by Cranmer, including that of Gardiner, as also of some performed by Archbishop Warham and Cardinal Pole, are equally wanting. Cranmer especially was notorious for his carelessness in keeping the registers. Lingard, after recounting the positive grounds for assuming that Barlow was consecrated, thus describes the argument urged by those who deny it:—"Why are we to believe these impossible, these incredible suppositions? Is there any positive proof that he was no bishop? *None in the world*. All that can be said is that we cannot find any positive register of his consecration. So neither can we of many others, particularly of Bishop Gardiner. Did any one call in question the consecration of these bishops on that account? Why should we doubt the consecration of Barlow, and not that of Gardiner? I fear the only reason is this—*Gardiner did not consecrate Parker, and Barlow did*." To raise the question of jurisdiction is simply irrelevant. That, on the received Roman view, lately endorsed by the Vatican Council, none of Parker's consecrators had or could have any jurisdiction, precisely because they were out of communion with Rome, is too obvious to require a moment's discussion. But it is also certain that, on the strictest Roman Catholic principles, the defect of jurisdiction would prejudice the regularity only, not the validity, of their acts.

3. The third objection is the most comprehensive and important, involving as it does various controverted questions both of doctrine and of fact, though it is not, as far as we can see, even once referred to by Dr. Hook. To argue it out would demand a treatise. We must be content to state results. The adequacy of the Edwardian Ordinal, maimed and meagre as it confessedly is, has often been admitted by Catholic divines, and certainly follows from the principles laid down by such high liturgical authorities as Martene and Morinus. It is implied in the brief addressed by Julius III. to Cardinal Pole, and acted on by him, and must have been expressly recognised by Pius IV. if the statement be accepted, for which Dr. Hook adduces strong evidence, that he offered to sanction the Elizabethan Prayer-book and Ordinal, as "comprehending all that is necessary to salvation." If, however, the question is mooted, it can only be met by an appeal to "comparative liturgiology," and this test has been exhaustively applied in seven successive chapters of Dr. Lee's work on the subject, dealing with a series of Eastern and Western forms universally allowed to be sufficient. The comparison makes it clear beyond possibility of cavil that the sufficiency of the Edwardian Ordinal, which differs in some points for the worse from that of 1662, can only be contested on grounds which would prove a great deal too much. The omission of the *traditio instrumentorum*, which has been chiefly relied on, is an objection which refutes itself; for the formula was only introduced into the Latin Church in the twelfth, or at earliest tenth, century, and has never been adopted in the East, as is expressly admitted by Perrone. There remains, however, the question of *intention*, and much ingenuity has been expended on the attempt to show that Barlow and Scory, two of Parker's consecrators, were heterodox on sacramental doctrine, and cannot therefore have intended to confer the episcopal character. If it were so, there would still be two of the four consecrators whose orthodoxy is not impugned, but the whole enquiry is really beside the mark. The intention required by the Council of Trent for valid administration of sacraments is simply "*intentionem saltem faciendi quod facit Ecclesia*" (*Sess. vii. can. 11*). A sacrament ministered, e.g. by a priest who was drunk or asleep, or acting in joke, would be invalid. But it certainly does not mean that his theological apprehension of its

nature must necessarily be correct, so long as he really intends to do what the Church does, or what Christ ordained. Bellarmine distinctly lays down this principle: "Non est opus intendere quod facit Ecclesia Romana, sed quod facit Ecclesia vera, quaecunque illa sit; vel quod Christus instituit" (*De Sacram.* lib. i. c. 37). And in the performance of a public act the intention of those concerned to do what they are ostensibly engaged in doing must be assumed in the absence of any outward sign to the contrary, or doubt would be thrown on the validity of every sacrament ever administered. There can be no doubt whatever as to the act Parker's consecrators were commissioned to perform, and were on all sides understood to be performing. It was to consecrate a bishop, neither more nor less, and Dr. Hook argues fairly enough from the preface to the English Ordinal that the word bishop is unquestionably there "employed in the sense which has always been attached to it in the Catholic Church." Nor can there be a shadow of doubt that it was so employed and understood by Elizabeth and her advisers in Church and State. There is then no ground for doubting that the consecrators of Parker, publicly using that ordinal, intended to make him a bishop; nor would the validity of their act be affected if it could be shown that one or more of them held heterodox opinions about the grace of the sacrament.

Here the discussion, as far as Parker's case is concerned, might close. But it seems hardly respectful to so high an authority to pass over in silence Dr. Newman's recent contributions to the general subject in two letters to the *Month* for September and October, 1868, and a Note in his recently published *Essays Critical and Historical* (vol. ii. pp. 74 sqq.). Dr. Newman, however, professedly deals with considerations "independent of any question arising out of Parker's consecration," and, indeed, of historical, or, as he calls them, "antiquarian arguments," altogether; and it is of these alone that historians, as such, can be expected to take account. The arguments urged in the letters to the *Month* are of an *à posteriori* kind, such as the carelessness of the Anglican clergy in administering baptism, their irreverence about the Eucharist, and the like, which will appeal with very various force to different minds according to their theological or other bias, and their estimate of the facts alleged. The inference suggested would rather point to some possible break in the chain of succession after Parker's time. In the Note to the *Essays*, published last year, the argument is ultimately resolved into the further, and distinct, question of the exclusive claims of the Roman Catholic Church. "Catholics believe their orders are valid, because they are members of the true Church," and are not, therefore, called upon to adduce detailed evidence of the fact; whereas the *onus probandi* lies upon Anglicans, and, if we rightly understand the illustrious author, it is a burden they are, from the nature of the case, incapable of sustaining, because "there is no security for the transmission of the apostolical ministry, except as continued in that Church which has the promises," i.e. the Roman Catholic Church; "the orders depend on the Church, not the Church on the orders." And thus the argument is merged in the wider question of the notes and limits of the Visible Church. Into that discussion we shall not, of course, enter here, and with two general remarks on Dr. Newman's line of argument, this review must be brought to a close. In the first place, it is obviously not so much a plea in disproof of the validity of Anglican orders as a demurrer to the need for any discussion of a point which might be at once admitted if the Church of England were a true Church, but which, as matters are, is both immaterial and incapable of proof. It is obvious, in the next place, that the argument,

as stated in the *Essays*, tells equally against the security of the ordinations of the Greek and Russian Churches, and various heretical bodies in the East, which are, like the Anglican, incapable of mathematical proof, but have never been called in question, and are admitted by the theory and practice of the Church in communion with Rome.

It will be gathered from what we have said that there is much of interest in Dr. Hook's last volume, though it might well have been more skillfully put together. We may add that, besides other blemishes already referred to, it is disfigured by several strange slips of the pen or printer's errors—it is not always easy to say which—and that an alphabetical index, and a much fuller and more careful arrangement of marginal analysis and dates, is a crying desideratum.

H. N. OXENHAM.

#### NEW INSCRIPTIONS.

SOME months ago the casual upturning of a marble slab on Monte Cavi gave us the date of the abdication of the decemvir Appius Claudius and his fellow-tyrants, and now another slab discovered on the Forum Romanum furnishes us with that of the first triumph of King Romulus himself, and though few scholars of the present day may be inclined to give credit to this statement, even the most sceptical, we trust, will look with interest, and indeed with reverence, to these morning-mists of fable ushering in a long series of splendid and real triumphs; on the old duel between King Romulus, of newly founded Rome, and King Acron, of Caenina, now brought down to the first new-year's day of the new republic. The brief fragment runs thus:

ROMVLVS · MARTIS · F · REX · ANN II  
DE · CAENINENSIBVS · K · MARTIS  
romulus MARTIS · F · REX · II . . . . .  
de antemnatibus . . . . .

The only two authors who give us extracts of that part of the triumphal table which regards Romulus are Solinus and Plutarch. Solinus tells us (c. i. 20): *Romulus . . . de Caeninsibus egit primum triumphum et Acroni regi eorum detraxit spolia . . . rursum de Antemnatibus triumphauit, de Veientibus tertio*; Plutarch (*Rom.* 25) gives the date of the third triumph, the ides of October. These dates, though not really historical, nevertheless are curious enough. No doubt the two dates hitherto known of the triumphing of the son of Mars, the first king of Rome, coincide intentionally with two great festivals in honour of the god Mars, the kalendae Martiae being the feriae Martis of the old Kalendaries, and in fact the birthday of the god himself (*C. I. L.* i. p. 387), the ides of October the day of the slaughtering of the victorious horse in the Campus Martius in honour of the same divinity (Marquardt, *Handbuch*, iv. 277). It may be noticed too that the old *fable convenue* does not lack the accurate dates and the showy pragmatic appearance with which historical falsification has always decked its creations. Rome was founded on the 21st of April of the year 1, of course, the year beginning then on the 1st of March. For four months the new commonwealth was conducted, if not on strictly monastic principles, still without any assistance of the fair sex; but on the Consualia, the 21st of August, matrimony was introduced by the wholesale operation commonly known as the rape of the Sabine women (Plutarch, *Rom.* 15; Varro *de L. L.* c. 20). The autumn and winter, apparently, were given to diplomatic operations between the Romans and the various tribes that had suffered by the rape; as usual, they waited for spring in order to begin the war. But King Acron of Caenina was more forward than the rest, and began operations early and alone (*προεβασίστη τῷ πολέμῳ*, says Plutarch); so it came about that the first new year the republic saw was inaugurated by the entrance of the victorious king, carrying on his shoulders the trophies of the enemy slain by his own hand on the battlefield. When the great battle between the Sabines and the Romans was fought, the intervening ladies already were mothers.

The students of Roman law and classical antiquities may hope to get a monument of the same kind as the famous tables of Salpensa and Malaca, the only remnant of the privileges

granted by republican and afterwards by imperial Rome to their Latin cities. Mr. Ramiero de P. Caballero Infante y Quaro, a rich proprietor of Seville, has lately acquired three bronze tables, of two or three columns of thirty lines each, containing administrative regulations of the early imperial epoch. The fact is certain, as I have been informed by trustworthy and learned eye-witnesses; but nobody is allowed to copy them, as the proprietor reserves to himself the privilege of the first publication. Nobody certainly will grudge it to him, if only he will make rational and moderate use of his right of proprietorship, and give soon what the public may justly claim as part of the great heritage of ancient Rome. TH. MOMMSEN.

### Intelligence.

Dr. Aloys Sprenger, the well-known Semitic scholar, who for many years was resident in India, and is now living in Switzerland, proposes to write for the *Journal* of the Royal Asiatic Society a series of essays on the Early Geography, History, and Commerce of Arabia. Two of these papers have already been read at recent meetings of the society, and will, we understand, appear in the number of the society's *Journal* about to be published. In his first essay, Dr. Sprenger contested the views of those scholars who consider the Ishmaelites as the ancestors of the Northern Arabians. The indigenous traditions of the Arabians, which assign such an origin to the Ma'addites, can, he argues, be distinctly traced to the Jews, and are therefore valueless; and even Mohammed had different notions regarding Ishmael after his flight from Medina from those he had held whilst residing at Mecca. The principal point Dr. Sprenger endeavours to establish is that the Ishmaelites were extinct in the fifth century of our era, and that, therefore, long previous to the Moslim conquest they had ceased to form a distinct race.—Dr. Sprenger's second paper treats of Aelius Gallus' campaign in Arabia in 18 B.C. He shows it to be probable that the work *De Expeditione Arabica* of Juba II., King of Numidia, and son-in-law of the Triumvir Antonius, was written for Augustus previous to Gallus' expedition, as a kind of report on the country about to be invaded. The account of Arabia and of the expedition given by Strabo, the personal friend of Gallus, was, Dr. Sprenger argues, on the contrary, written so as to represent Arabia as a complete *terra incognita*, and thus to exonerate Gallus from any blame for having failed to conquer that country. Dr. Sprenger then examines the geographical statements of these writers, especially those of Juba as given by Pliny, and endeavours to identify in a most interesting and ingenious manner the various names of places and tribes mentioned. Of his identifications the most important is that of the *Minæans* of Greek writers with the *Kindites* of Arabian and Byzantine historians. Dr. Sprenger's papers will be found to throw much new light on this obscure chapter of ancient Arabic history.

### Contents of the Journals.

Von Raumer's *Historisches Taschenbuch*, 1872, contains a biography of Maria, the wife of the Palatine Frederick III., one of the excellent women of the Reformation period, whose great-grandson married Elizabeth, daughter of our James I.—There is also an account of the Huguenot emigrants in Germany; we may compare the corrupted names with those in England, e.g. de Ruffignac corrupted into Roughneck.—Some light is thrown on the destruction of the Anabaptist state at Münster in 1535 from a contemporary (legendary) narrative.—A description of the Marquise du Deffand's life (well known to us from Horace Walpole) is given to illustrate the social state of the eighteenth century.—Of our own time, we have sketches of Maximilian II. of Bavaria, so celebrated in the world of artists, whose political idea was to balance and unite Austria and Prussia by a league of the little states under the leadership of Bavaria.—On the other side, Giesebrecht gives us his recollections of Rudolf Köpke, one of the patriots of 1848, who just lived to see his scheme of German unity carried out in 1866—the intermediate time was spent in literary work on the national history of Germany. The interest of the whole number is thus mainly biographical.

Von Sybel's *Historische Zeitschrift*, 1872, 3rd part, contains an important article on the Icelandic sagas about the early times, especially that of Egil—the statements of which we can check from the information given by Ohthere, the voyager to King Alfred, about the state of the North at that time, and from the Anglo-Saxon Chronicle—since Egil is made to visit Athelstan and take a decisive part in the great battle against the Celtic and Norse invaders of England. The result of the enquiry is in both cases unfavourable to the authenticity of the saga.—A description is given of the election of Pope Urban VI. in 1378, which led to the great schism during which three popes were excommunicating each other.—An account of "the Jesuits in Syria" is interesting just at this time.—"The Regency in Greece, 1833–5," is a narrative of the unlucky attempt of the Bavarians, well intentioned but

pedantic men, to govern during King Otto's minority.—Among the shorter notices is a review of Freeman's *Essays* by Pauli; and a reply by Büdinger to Dummmler's essay on the historian Bishop Liudprand of Cremona.

Bullettino dell' Instituto, May, describes the various articles found at the Emporium, some of which show an active commerce with Spain; the origin of the curious Monte Testaccio is also discussed, which is composed of fragments of pottery from the Emporium—the breakage of the imports during centuries: the inscriptions on some of the uppermost fragments bring us down to the fourth century A.D.—Jordan describes the Septizonium of Severus (the etymology of the word is difficult) as consisting of three rows of pilasters only.—Henzen gives the new fragments of the Fasti found in the Forum, the most interesting of which is described by Professor Mommsen in his letter to us (see p. 257).

### Philology.

Nonii Marcelli *Peripatetici Tubursiensis* de Compendiosa doctrina ad filium collatis quinque pervetustis codicibus nondum adhibitis cum ceterorum librorum editionumque lectionibus et doctorum suisque notis edidit Lud. Quicherat. Paris: Hachette.

THE present generation is probably more familiar with the name of Nonius than any since the Renaissance, if not indeed than any since the work was first published; for it may safely be asserted that at no other period has the study of remains been more absorbing than the present, and the widely extended circulation of Ribbeck's *Tragicorum* and *Comicorum Latinorum Fragmenta*, Vahlen's *Ennius*, Riese's *Varronis Saturae*, Peter's *Historicorum Romanorum Reliquiae*, and other collections of a like kind, present no name so habitually as his. Nonius is, in fact, our great repository of early Latin fragments; of Lucilius alone, five hundred passages, according to M. Quicherat, are preserved by him. He is besides the only ancient author who has preserved considerable excerpts from the lost works, particularly the *Saturae*, of Varro; and no one who has not studied these can have any clear conception of the manysidedness of Latin literature in the splendid period of Cicero, Catullus, and Lucretius. Of all the great Roman writers, Varro seems to have been the most deeply learned in the language and antiquities of his country; but the fragments of the Menippean satires show him besides in the double character of a humourist and an innovator in language; and are interesting enough to make us wish that we could have bought only one of them by the sacrifice of part of his equally voluminous, but much more religiously preserved contemporary.

The MSS. of Nonius go back to the ninth century. This seems to be the date of the valuable Harleian, excerpts from which had been published before, particularly in Riese's *Varronis Saturae*, but which M. Gustave Masson has collated throughout for M. Quicherat. Of the great value of this codex I can speak from experience, having collated a large number of the fragments of Lucilius in it; and there can be little doubt that no restoration of the more obscure Nonian passages can be considered certain until the first reading of

Harl. has been carefully made out. In some places it preserves traces of a reading prior to the corruption which, in common with other MSS., it adopts; in others its agreement with the rest of the early MSS. enables us to decide with certainty in favour of readings or spellings hitherto rejected as improbable. For instance, at p. 125, *ientare, ientaculum* is written in Harl. throughout *icientare (ieentare), ieientaculum*; this is also found in three others of the MSS. collated by M. Quicherat; and it is in all probability right, as Ribbeck has seen, though M. Quicherat adheres himself to *ientare, ientaculum*. So again Harl. gives *permities* not only at p. 153, where Roth and Gerlach also give it from their MSS., but at p. 218, *pestem permitemque catax quam et manlius nouius (nouis is a later alteration)*, and in the quotation from Attius; and here also, I think, rightly, against Roth and Gerlach's MSS. So, again, at p. 131, the passage from Varro's *Catus male enim consuetudo diu improbo rata est inextinguibilis*, for so it is written in Harl., explains its own corruption, *i.e. inroborata*. Here most of the MSS. are in the second stage of corruption, *improborata*, whence the *importata* of many editions. Besides Harl., the chief MSS. newly employed by M. Quicherat for his edition are—(1) M, the Montpellier, much mutilated, but of independent value; (2) P, No. 7667 in the library of Paris, partially collated by Reuens for his *Collectanea*, 1815; (3) C, or Colbertinus, 7666 of the same library; all these belong to the tenth century; (4) O and Q, two Paris MSS. of the fifteenth century, on paper. Besides these he has availed himself of the collation of the excellent Wolfenbüttel codex, which makes Gerlach and Roth's edition so authoritative, as well as of others at Basle, Berne, Geneva, and Leyden. With such resources the new edition of Nonius cannot fail to be interesting: though the actual variations of the new MSS. are perhaps less considerable than might have been anticipated. The conjectures of a long series of critics are on the whole adequately represented in the apparatus; and owing to the small size of the type in which the apparatus is printed, the reader is not distressed by anything like a disproportion between the text and the notes. Moreover, the references are given, book and line, side by side with the extracts; and much time is hereby economized. Again, verse is printed as verse, prose as prose; and though it is not to be forgotten that in some cases what looks like prose may be really verse, *e.g.* in passages of Varro's *Saturae*, yet it is better to read what is uncertain verse as prose than what may be prose as verse. In fact, M. Quicherat's edition of Nonius is to an ordinary reader a sufficiently attractive book not to repel, and perhaps to attract, him.

The case is however very different with an advanced student of Latin. To such the edition of Roth and Gerlach will, if I mistake not, still be *the* edition. For it presents with unexampled clearness and unrivalled fidelity the *exact text of Nonius*, with its corruptions, misspellings, and even mistakes as they are in the MSS.; an advantage almost incalculable in an author where so much is necessarily uncertain, and where so large a part of the gain of perusal consists in the careful study of recurring palaeographical or orthographical confusions. It has been elsewhere observed by me that in no author is the interchange of *v, b* more frequent than in Nonius; it may be added that in no author, it would seem, have the MSS. preserved on the whole, if we take the Harleian and one or two others as our guides, a more careful orthography. This remark is much more important than at first sight it may seem: for we are dependent on Nonius for the greater part of the fragments of all the lost writers of the early period of Latin literature. If then, at p. 113, where a passage of Sisenna is quoted, the words *fera bile* occur twice, is it certain that Sisenna wrote *fera*

*uite*? We do not reason so in other cases; where *permities* is repeated, we accept the repetition as significant and real. We accept *rinoceros* as the probable spelling of Lucilius, on the showing of Nonius; he may also have written *cocsendicas, cocsendicibus*. At any rate, once give up the principle of following the best MSS., and uncertainty is the inevitable result. The few pages of early inscriptions in the first volume of Mommsen's *Corpus*, and the very limited number of words which they contain, are, to say the least, a very inadequate standard for the spelling of the whole ante-imperial period.

From this point of view, then, it is impossible to overrate the merits of Roth and Gerlach's *Nonius*, a book, in its way, of unique correctness and fidelity. For the same reason it is impossible to speak with entire satisfaction of M. Quicherat's performance. Take as an instance p. 229: *Tarditas generis feminini. Masculino Varro Vimarco: ne me pedatus uersuum tardor (neprenet tarte cum pritymon certum; so R. and G. M. Quicherat changes Vimarco to Bimarco, pedatus to pedatu primo, neprenet t. c. p. certum to Refraenet, arte quum premo ῥυθμῶν sertum*. It would surely have been better to have indicated that a disyllable is lost in the first line than to introduce a word which, like *primo*, spoils the evenness of the metre: in the second line, *refraenet arte rhythmon*, all are probably right; *cum premo* is doubtful; it might as easily, or more so, be *cum parit (perit, then pit)*; *arte* is thus ablative and *rhythmon* accusative: *certum* is not to be altered. Take again the interesting fragment from Lucilius, p. 428, where the poet distinguishes *poesis* from *poema*. M. Quicherat has not only altered this unnecessarily, *e.g. quidve hoc intersit illud* to *q. h. intersit et illud*, but actually introduced a metrical enormity. The MSS. give *primum hoc quod dicimus esse poema pars est parua poema (poesis, some MSS.) idem epistula item quaeuis non magna poema est illa poesis opus totum totaque illa summa est una θεῶν ut annales Enni atquestoc unum est hoc maius multo est quam quod dixi ante poema*. This is given by M. Quicherat thus:

Primum hoc quod dicimus esse poema  
Pars est parua poesis ut est et epistola quaeuis.  
Illa poesis opus totum; tota Ilias una  
Est θεῶν, aut Annales Enni; atque hoc [opus] unum  
Est maius multo quam quod dixi ante poema.

This, to say the least of it, is no improvement on the conjectures of previous editors. It is more natural to suppose, with L. Müller, a lacuna before *epistula*:

Pars est parua poema . . . .  
Epistula item quaeuis non magna poema est.  
Illa poesis opus totum; tota Ilias summa est  
Una poesis ut Annales Enni; atque si (hoc) unum est,  
Hoc maius multo est quam quod dixi ante poema.

*Poesis* for *θεῶν* is an old conjecture of Mercer's; the rest is little more than drawing out the words of Nonius; there is nothing to show that Lucilius did not shorten *hoc* as Seneca did after him; the meaning is clear. "Again any particular letter of no great length is a poem; but that other word *poesis* means a complete work: thus the complete whole of the *Iliad* is a single *poesis*, like the *Annals* of Ennius; and if this is *one*, it is a *one* that is much greater than the short poem I spoke of before." In the last words he seems to answer a possible objection: "if *poema* is a single piece of poetry, *poesis* would seem to be an aggregate: how then can it be one? Answer: it is one as a whole, and differs in its oneness by being much larger than a single *poema*."

Again, if M. Quicherat prints his own clever conjecture *συνάρθρωσι* in the corrupt article *gralatores*, p. 115, might he not have admitted Lachmann's admirable emendation of the passage from Varro's *Eumenides*, p. 119? Part of it, at least, seems certain, and is in the great critic's best style. Nor can it be denied that such arbitrariness in spelling as is too

perceptible throughout this edition of Nonius is unsatisfactory, and unworthy of M. Quicherat's reputation. If the MSS. give *attendere harundo conubiis gargaridians caelum coicere deicere Medientius dimittere ilico holerorum*, on what principle do we find printed *attendere arundo conubiis gargarisans caelum coicere deicere Mezentius demittere illico olerorum*? If *dissicit delicia* are allowed to remain, as they rightly are, why change such interesting remains of ancient Latin as the use of an abl. *qui*, after a plural noun in the article *gralatores*; especially when, as has been pointed out by M. Meunier (*Mémoires de la Société de Linguistique*, i. p. 24), the same writer Varro seems to have written, *L. L. ix. 67, unguenta quoi nunc genera aliquot*? These cases might be multiplied; they detract from the value of a work otherwise full of interest, and perhaps indispensable to every future student of Nonius.

R. ELLIS.

## THE MANUFACTURE OF INSCRIPTIONS.

## TO THE EDITOR OF THE ACADEMY.

SIR,—The organization in Jerusalem for the forgery of inscriptions, to which I have already, by your kind permission, referred (*Academy*, vol. iii. pp. 179, 180), would seem to be assuming larger dimensions. A stone, with twelve lines, which has lately been produced, is either in new characters (though some are Nabataean) or, more probably, is a forgery. But my special object in writing to you is to state that M. Shapira, the merchant, is not, as I conjectured, the deceiver, but the deceived. The doubts which I expressed as to his character arose partly from private enquiries and partly from the impressions received by myself and others in visits to Jerusalem. I have now the pleasure of informing you that these doubts are unjust to M. Shapira. According to the testimony of reputable persons in Jerusalem, such as the Bishop, who is staying at Basel, he was even honourable enough to refuse to sell a stone of (to him) doubtful genuineness except on the understanding that he should be free from blame should the inscription turn out to be spurious. It is to be hoped, however, that people in Jerusalem will bestir themselves to find out the real forgers. I regret not to have been better informed in the matter. Shapira, as a correspondent tells me, had already been three years a Christian when he came to Jerusalem.

A. SOCIN.

Basel, May 27, 1872.

## Intelligence.

The 38th annual meeting of the Congrès scientifique de France, started and organized by the well-known archaeologist, M. de Caumont, is held at Saint-Brieuc, in Brittany, on the 1st of July and following days. The work of the Congrès is divided into five sections:—(1) Natural, physical, and mathematical sciences; (2) agriculture and useful arts; (3) anthropological and medical sciences; (4) history and archaeology; (5) philosophy, social economy, literature, and fine arts. Amongst the lectures which will take place, we may notice the two most interesting of the 4th and 5th sections: M. Morvat will give the complete collection of the Latin inscriptions discovered up to this time in Brittany (about forty-two in number, we believe), and will explain them—M. Morvat has already published, two years ago, very interesting *Études philologiques sur les Inscriptions gallo-romaines de Rennes* (Paris: Franck)—and M. Luzel will deliver a lecture on the authenticity of Breton popular ballads, and of M. de la Villemarqué's *Barzaz-Breiz*.

At a meeting of the Society of Biblical Archaeology on June 4, Dr. Eisenlohr, of Heidelberg, communicated a paper on the religious and political revolution described in the Harris papyrus. He considered the latter to express the Egyptian view of the events which were the immediate cause of the Exodus. We are happy to add that this fine hieratic papyrus is probably on the point of being added, if it is not already added, to the national collection.

## Contents of the Journals.

*Philologus*, vol. xxxi. pt. 4.—M. Schmidt: On *Anonymus de Musica*, § 98. [Attempts to settle the rhythmical character of the examples given in this passage.]—Fr. Matz: H. Brunn's "Second Defence of the Pictures of Philostratus."—G. R. Sievers: On the History of Herodian. [A series of detached notes.]—K. Georges: Miscellaneous Obser-

vations.—D. Campe: Horace and Anacreon. [An investigation into the amount of imitation of Anacreon to be found in the Odes of Horace.]—K. E. Georges: *Terporypduaros*.—H. W. Schäfer: On the Circumference of the Earth according to the Ancients. [Examines the estimates connected with the names of Aristotle, Archimedes, Eratosthenes, and Posidonius. Rejects the notion that they were derived from Babylonian and Egyptian learning. The method of Eratosthenes was thoroughly correct, but it is impossible to say how nearly his result was so.]—L. Urlichs: On Eustathius.—N. Wecklein: The Aeschylean Literature of 1859–1871. [Supports the critics whose method depends wholly on the Medicean manuscripts and its scholia; also those who find symmetrical arrangement in speeches like those of the Seven against Thebes.]—H. S. Anton: Corn. Nepos, *Mil.* 8, 2.—F. W. Munscher: On Xenophon, *Anab.* iv. 8, 2.—On *Parta tueri*. [By several writers.]—Th. Wiedemann: Excursus on the Dissertation, "On the Age of Curtius Rufus." [Continued from last number.]

*Zeitschrift für die österreichischen Gymnasien*, vol. xxi. No. 10.—On the Concords in Greek Syntax; by J. La Roche. [A valuable contribution to Greek grammar. The treatment of concords in Greek has usually been based upon the rules framed by Latin grammarians. The writer confines himself to the language of Homer and the early poets, e.g. Alcæus: nor does he attempt to explain the peculiarities which present themselves. But nowhere can be found a fuller or better arranged digest of usages.]—H. B. Heller reviews a number of recent works on the *Oedipus Rex*.—No. 11.—Mähly: On Phædrus. [Suggests various emendations.]—A. Conze, the well-known professor of archaeology at Vienna, gives a valuable notice of eighty-seven recent works on his subject. Perhaps his remarks upon Michaelis' *Parthenon*, and on Brunn's revolutionary *Problems in the History of Vase-painting*, are the most interesting.—W. Foerster reviews various recent editions of the *Oedipus Rex*.

*Philologischer Anzeiger*, vol. iv. No. 1.—Of the reviews of new works in this journal we notice the following:—P. 42: C. W. on the third edition of Schömann's *Greek Antiquities*. [Suggests a few slight points which have escaped the aged author, who in most cases is thoroughly abreast of the latest investigations.]—P. 46: Review of C. Trieber's *Enquiries into the History of the Spartan Constitution*.—P. 50: Review by R. E. of Michaelis' *Parthenon*. [Warm and discriminating praise of this admirable work.]—No. 2.—P. 69: C. Liebhold reviews Volquardsen, *On the Mythos in Plato*. [Good; especially for the digest of previous enquiry into the same subject.]—Review of Professor Ramsay's edition of the *Mostellaria*. [Unfavourable.]—No. 3.—P. 120: Review by A. H. of Blass' edition of Antiphon and of Dinarchus, in the Teubner series of texts. [Laudatory.]—P. 140: A. Forbiger's *Hellas and Rome* (a popular representation of public and domestic life of the Greeks and Romans); pt. 1, Rome in the Time of the Antonines. Reviewed by O. [Compared quite unfavourably with Becker's well-known *Charicles and Gallus*.]—No. 4.—P. 189: W. reviews Merkel's edition of the Laurentian MS. of Aeschylus; printed at the Clarendon Press. [Fully appreciates the value of this fine work.]—A. Philippi, *Contributions to a History of Athenian Citizenship*; reviewed by H. Frohberger. [Justly recommends this interesting essay to all students of Greek and Roman history as original and correct in its main views, fairly exhaustive in its reference to authorities, although occasionally too polemical in tone.]

The *Pandit*, vol. vi. No. 72.—The *Śabdakhaṇḍa* of the Chintāmaṇi, with a comment (continued).—*Brahmaṁīmāṁsābhāṣya*. [Adhyāya I. pāda 1, sūtras 1–18.]—Rājasekhara's drama *Viddhaśālabhanjikā* (concluded).—Sanskrit text and English translation of the *Vidvanmanoranjinī*, a commentary on Sadānanda's *Vedāntasāra*, by Rāmātrītha (continued; by A. E. G. and G. D.).—Supplement: Catalogue of Sanskrit Manuscripts (continued; vols. 72–75 of the *Dharmaśāstras*).

## General Literature.

Lamartine. *Sa Vie littéraire et politique.* Par Ch. de Mazade. Didier.

*Twenty-five Years of my Life, and Memoirs of my Mother.* By Alphonse de Lamartine. Translated by Lady Herbert. Two Volumes. Bentley.

FOR thirty years, from 1820 to 1850, if the suffrages of the reading public in France had been taken, an overwhelming majority would have placed Lamartine at the head of the list of living authors; and the result would not have been very widely different if the votes had been weighed instead of counted, for though there were some writers who had a following of more enthusiastic admirers, each of these had also a body of influential opponents; Lamartine was at once the favourite of the masses, and at worst coldly esteemed or gently satirized by the extreme factions in literature. As Louis Blanc said of him in 1849—it was meant as an accusation—"he had not the art of making mortal enemies," and it is only mortal enemies who defeat their own purpose by embalming their adversaries in their best invective. At the present day Lamartine is the type of a past rather than an unpopular fashion: he is forgotten without being disliked. But a man who occupied at first so much and then so little space in the eyes of his contemporaries deserves to be studied at least as a man, if not as a writer, for the more insignificant he appears in that character the more need there is to explain the personal ascendancy by which he imposed on the world. M. Charles de Mazade's little book, his contribution to the *Revue des deux Mondes* during the siege of Paris, comes opportunely to invite the sober, critical judgment to pronounce itself once before the author of the *Méditations*, of *Jocelyn*, and of the *Histoire des Girondins*, is silently shelved amongst the second-rate, or the sixth-rate, classics of French literature. M. de Mazade does not bestow much thought on the question whether Lamartine is a real poet at all; that, like most of his countrymen, he is still disposed to take for granted; but he counts the vagaries of the spoilt child of fortune and society as so much on the wrong side of the balance-sheet of fame; he makes the poet responsible for the failures of the politician, the inaccuracies of the historian, but he omits to derive confirmation—which is scarcely, however, superfluous—of the reality of Lamartine's imaginative inspiration from the fact that he had neither judgment, learning, nor character enough to enable him to play all or even one of the parts in which he did as a fact make a not inconsiderable appearance. It may seem to be a distinction without a difference, but we are inclined, instead of blaming the poet for all that the man was not, to give the poet credit for all that he was; instead of saying: *Le Lac* is good poetry, but its author is "only a poet," or he would have saved society in 1848, we should say: the author of *Le*

VOL. III.—NO. 52.

*Crucifix* must be a poet after all, for he conjured the spirit of anarchy for a day, with no help save from a few abstract principles, by the might of which he floated during three months in the van of a liberal revolution, for which he had otherwise no natural affinity or inherited sympathy. On the other hand, it is certainly a fault or a weakness in the poet, as poet, that the elevated ideal character which he half wished to be, half thought he was, required to be rounded and completed by qualities and glories of an extra-poetical nature.

In this respect Lamartine was a victim to the literary tendencies of his time, to the taste for sentimental introspection which made it a condition of popularity that poetry must be not merely good in itself, but must contain the very soul and marrow of the poet, his whole subjective consciousness, the most intimate experiences of his heart. It is not, of course, altogether unreasonable to expect that a great poet shall have a great soul; but, after all, the man and his work are necessarily distinct, and the attempt to confound and identify the two is answerable for what seems to us theatrical and insincere in Goethe, Byron, and, on a smaller scale, in Lamartine. They acted well, but they acted at an audience which was not precisely immortal, and so far they put their memory at the mercy of a stage tradition; their importance was partly historical instead of purely artistic. For Goethe and Byron there was compensation; the former almost succeeded in resuming in his own poetical autobiography (forming the greater part of his works), the intellectual and moral life of two generations; and Byron, whose genius was naturally objective, gained rather than lost in the richness and power, with which he represented his one hero's figure relieved against a background of the finest scenery in southern Europe, from the belief, calamitous only to his friends and relations, that it was incumbent on him in private life to approach as far as possible to the ideal creation of his fancy. With Lamartine the case was different. The volume of *Méditations poétiques*, which obtained a brilliant success in 1820, the poet being then twenty-nine, was an innovation in form rather than in matter. To love like St. Preux, to weep like Werther, and to accept the consolations of religion like René, was not an original programme, but to do each and all of these in flowing, harmonious verse, which was "like neither Delille, nor Luce de Lancival, nor Esménard"—the popular authors whom his publisher advised the young Lamartine to study—was to do something which had not then been done in France, and, as it proved, to secure a reputation which, as reputations go, cannot be called undeserved.

M. de Mazade says of him that he transforms into poetry the sentiments which women and children share with men. In other words, he is the poet of emotional mediocrity; his muse satisfies the aspirations of the many simple souls to whom a rudimentary art has become a second nature, and whose sentiments are scarcely more complicated than if they were primitive, though their vigour has been much attenuated in passing into the conventional mould. The beauties of uncultivated nature were a new discovery to the generation which preceded Lamartine, and to his contemporaries there was still something new in the idea of a natural, intimate harmony between the moods of man and the changes of the outer world. Lamartine had a more than commonly vivid sense of the resemblance between life and a water-course, between falling leaves and fading hopes, between lovers' tears and the dew of heaven, between birth and death and night and morning, and in general of the analogy between material and spiritual existence. Melancholy without despair, hope without enthusiasm, tenderness

without passion, piety without intolerance, loyalty for the king and loving words for the people—it was the *juste milieu* itself incarnate in rhymes, which were not incorrect nearly so often as the Orleanists tried to make out.\*

His ideas were never profound, and twenty years was more than long enough for them to become commonplace, as the speculative parts of *In Memoriam* and *Locksley Hall* are commonplace now; but "commonplace" only means that the opinion is too familiar, the truth too obvious, to be worth stating. And this is scarcely a reproach to a poet, since art should deal with the eternal and immortal verities, and a truism is as good as a truth if it can carry off as rich a lyrical disguise. Granting that Lamartine's themes are trite, and his treatment of them somewhat monotonous, it is just the oldest stories which bear repetition best, because their application is being always renewed; subjects of perennial interest carry their recommendation in the reader's consciousness, and he neither expects nor wishes to be told of emotions he cannot share. The emotions which everyone knows by sight, or a closer experience, inspire Lamartine's lyrics, and though the delicate excellencies of the most refined French poetry are apt to escape the dull perceptions of a foreigner, the readers of Lamartine will be struck by a something which evaporates in paraphrase or translation, the aroma rather than the bodily presence of poetry, like a spirited variation on a stupid air, which almost disguises the intrinsic meagreness of the melody; in fact, by the presence of those merits of poetical style which almost any one can feel, though it takes a Sainte-Beuve to analyse and describe them, and which suffice to make a few admirable poems, though they do not alone make a really great poet. In Lamartine there was a possible Herrick *double* with an actual Cowper, and the combination did not prevent his writing some lyrical pieces neither too long nor too ambitious to be perfectly finished and satisfactory works of art. Here his misfortunes begin. There are many immortal poems, including the best anonymous songs, which are the works of men who, under the most favourable circumstances, would never have been anything but what are called minor poets. The neglect of this truth in the early days of the romantic movement was the cause of grievous disappointment and disenchantment to authors who had the misfortune to outlive a premature celebrity. To write a good stanza, a man must be a great poet, and once a poet, always and altogether a poet; at least so it seemed to Lamartine and the readers of the *Méditations*.

"Aimer, prier, chanter, voilà toute ma vie,"

he observes in the character of *Le Poète mourant*: and two-thirds of the task presented no appreciable difficulties: he had really been in love with the lady he calls Elvire, the Julie of *Raphaël*, and the best proof of his sincerity is that in his most senile *Confidences* he never gave her name to the public; but even without such a personal source of inspiration he might have sung the resigned sighs of a conventional lover as successfully as the religious aspirations which a conventional mother instils into the candid soul of a conventional child. In these cases he is only indirectly concerned in the sentiments he expresses, but the third part of his life is song, and here perforce the subject and object melt into one. The poet, that is to say, Lamartine, loves, prays, and sings, and his song is the record of his life, but his loves and prayers may be past, future, or altogether

imaginary, whereas it is an indubitable historical fact that he composes verses, for they are printed in many editions. The poet is the hero of his own poetry, and if he has not a commanding individuality like Goethe, and cannot like Byron originate an ideal type—inventing it first and imitating it afterwards—he is reduced to celebrating a conventional poet, and compelled to spend his days in considering what course of conduct the eternal fitness of things prescribes to the greatest poet of the age.

This preoccupation had a twofold effect upon Lamartine: it modified his poetry and it modified his life. The naïve self-conceit which is so amusingly satirized in Alfred de Musset's *Conte*, *Le Merle Blanc*, is partly accounted for by the fact that two characters, he himself and an ideal poet, were inexplicably confounded in his poetical soliloquies, so that the beautiful locks and limpid eyes which might be harmlessly attributed to the one, often gave a drolly egotistical look to descriptions of the other. And this was not the worst; when he had exhausted the subjects for occasional verse which presented themselves spontaneously, he felt obliged to conceive the plan of a great work, concerning which it is sufficient to say that, while *Jocelyn* formed one book or episode of it, *La Chute d'un Ange* formed another. Lamartine had the pen of a ready writer, and he was quite capable of enriching the world with the remaining twenty-two volumes demanded by his scheme if he had not contracted other engagements, also at the bidding of his ideal self. For this superhuman moral epic, even if it had been written, would have been at most a literary monument, and the hero-poet, according to him, has a threefold mission. From his earliest youth, he tells us, he had traced out in advance the programme of his life: his youth was to be devoted to poetry; a history, vast, philosophical, tragical, a history in the style of Tacitus, was to employ his mature age; and then with advancing years he was to plunge resolutely into the *mêlée* of practical politics and immortalise himself, either at the head of armies or—at the Hôtel de Ville. It is true that Lamartine, as M. de Mazade observes, was one of the men who possess in the highest degree "la faculté de l'inexactitude," and this account of his youthful aspirations, written when he was no longer young, is naturally somewhat coloured by the memory of intervening occurrences. But the romance is founded on fact, for besides the prophecies of his coming political greatness put into the mouth of Lady Hester Stanhope, in the *Voyage en Orient*, published at the beginning of his parliamentary life, as early as 1830 on his reception at the Academy, he had described the man of coming emergencies—orator, counsellor, poet—in terms which, with a speaker like Lamartine, can only be understood as referring to himself. "Sainte-Beuve l'a dit, Lamartine, l'académicien de 1830, prophétisait le Lamartine du gouvernement provisoire, avec cette nuance pourtant que certainement Lamartine avait fait ce qu'il avait pu pour que sa prophétie ne restât pas un vain mot." And this is exactly what spoils the sublimity of his *rôle*. Some are born great, some achieve greatness, but Lamartine was ever thrusting greatness upon himself, and an ideal of greatness constructed *à priori* by fixed principles and symmetrical rules, is wanting in one of the first conditions of poetical beauty, spontaneity.

Yet, even in politics, he is something more than a mere man of talent, though he is that as well. Where his personal vanity did not come into play, he had generous instincts and sound intuitions, and he was often unjustly judged because this or that party interest, which expected to find a tool in the poet, was baffled by encountering instead a somewhat *doctrinaire* statesman. M. de Mazade seems to do at once rather more and rather less than justice to

\* Madame de Genlis was one of Lamartine's severest critics: but then Lamartine's maternal grandmother had been under-governess to the children of the Duke of Orleans, and she was employed to counteract the influence of Madame de Genlis, and bring Mademoiselle d'Orléans back from Spain when the "Orleans party" was intriguing with Dumouriez.

Lamartine as a politician. That is to say, he tries him by the highest standard, and makes it almost an accusation that, tried by that standard, his career was not a success. But if we refuse to take Lamartine at his own valuation as the "homme d'élite" predestined to be at once the Homer and the Moses of a new liberal-romantic Israel, his failure was by no means absolute, and very far from disgraceful. All men but the very greatest are measured by their contemporaries. For fault of better, Thiers and Guizot were the Pitt and Fox of the monarchy of July; nature intended Lamartine for the Burke. In 1848 he raised a laugh in the chamber by the incautious expression, "En politique, Messieurs, j'ai beaucoup voyagé." The phrase was characteristic of the man, who, with all his desire to *pose* in the most becoming attitudes, really meant to be candid, and by unintentional self-betrayal of this kind was actually much more candid than he knew of. But his political "travels" only ranged from one disinterested and unpractical conception to another. As a legitimist and as a republican he took what seemed to be the most chivalrous side. The king is one against many, therefore there is something generous in undertaking his defence; but the people are weak, helpless, and oppressed, and to become the champion of the liberties of all is newer, less lucrative, and therefore even more generous. But his policy showed the same want of original vigour as his verses. His opinions rested on sentiment or instinct, and he was unfit either to lead a party bound together by fixed pledges or to found one consisting exclusively of personal adherents who would be content with a policy based on the character of their chief. When he was elected deputy for Dunkerque and asked where he should sit in the chamber, he replied: In the ceiling, for there was no room for him in any of the existing parties. And this was perfectly true, for he had not the practical experience of statesmancraft required of the man who is to direct a majority in times of peace, while he was without fixed principles or aims to inspire a consistent opposition. If the parliamentary conflicts of the reign of Louis-Philippe had related more to measures than to men, Lamartine would have been an intelligent but erratic critic, an uncertain but a conscientious ally, and he would have gained in importance by occupying a definite position as a liberal free-lance. But for this it would have been requisite that Thiers and Guizot should each have had something that could pass for a policy, and had that been so, it would not have been left to Lamartine to determine the government of France on the evening of the revolution. M. de Mazade naturally looks at 1848 by the light of 1871, and tacitly suggests a parallel between Lamartine and the present *chef du pouvoir exécutif*, of which the effect is to blame Lamartine, since he could not establish a popular republic, for not having instead proclaimed a regency or a dictatorship. But this is doing injustice to his one political accomplishment, a Cassandra-like insight. He was more constant in his antipathies than in his loves, though he had two of each. The divine right of the Bourbons to the throne and the divine right of the people to liberty claimed his allegiance in turn, but Napoleon and the Orleanists were double-dyed usurpers, inasmuch as they sacrificed liberty without an extenuating pedigree. If the mother and child that implored his protection in 1848 had been of the elder branch, it would have been the crowning moment of his life as he knelt to offer his homage, but he justly felt it would be absurd to sacrifice the cause of the people—and his own popularity—for the sake of "la royauté illégitime d'Orléans."

He was equally well advised in rejecting the other part offered him, though the motives which actuated him at the time are less obvious, so that we may, if we please, give a

moment of poetic inspiration credit for the forbearance which certainly did not arise from self-distrust. It is easy to exaggerate the importance of Lamartine's share in the revolution of February; he himself gives us every encouragement to do so; but the sudden and unprovoked collapse of his popularity shows us how hollow and insecure it must have been from the first. The revolution which he represented—for a French revolution is never one and indivisible—was sentimental, literary, Girondist, middle-class, but the vast majority of the middle classes cared as little for the republic then as now, and it was not thrust upon them by the same imperative political exigencies. The strength of the revolution was in the street, but Lamartine was powerless amongst the crossing factions and neutralised by the rising celebrities that he encountered there. There was Blanqui and a band of conspirators for the sake of it, the advocates of revolution *en permanence*, i.e. any government that a day at the barricades could upset; there was the democratic and social republic, the dream of the honest working classes and their heroes, Barbès, Albert and Louis Blanc; behind these there was the red revolution, which took its leaders day by day from the malcontents of the other factions, and depended for its strength in the last resort upon what Louis Blanc had described long before, the great *armée du mal*, consisting of all those who have been reduced by vice to misery, or by misery to vice. (In the days of June its effective strength was estimated at 40,000.) Then there was the Bonapartist faction, which had intelligences amongst the conspirators, and especially amongst the reds, where Louis Napoleon seems to have played the same mysterious and disastrous part as Égalité in the first revolution. And when we add to these all the shades of reaction throughout the country, we can judge what chance a moderate, aristocratic liberal like Lamartine would have had of establishing himself as dictator, even supposing he had known what to do next. It is true that for a moment, owing to the fears of the reaction and the prudence of the republicans, Lamartine's name, as the symbol of compromise, united 259,000 votes in Paris alone; but only six weeks later, that is, at the beginning of June, the list of popular favourites was headed by Causidière, the ex-prefect of police, with 147,000 votes, while Lamartine was nowhere with Ledru-Rollin. The man who had no enemies had no friends, and it is on the whole well for his reputation that either vanity or a worthier motive made him refuse to become the tool of interests and ambitions not his own. He retired into private life with his head on his shoulders, with clean hands, and with the recollection of half a dozen moments when he had prevailed with a passionate, puzzle-headed mob to forget that it was hungry and angry, and to fancy that the happiness which, more or less consciously, it was clamouring to receive from the state, consisted in conscious virtue, the admiration of Europe, and the privilege of embracing an eminent poet and historian on both cheeks. During his tenure of power his summary of a day's work used to be, "Je viens de faire cent discours et d'embrasser cent mille hommes!" and after all there must be good in a mob that can be pacified with a fraternal kiss and fine words. Of course more than this is needed to govern a country, but Goethe did not exactly govern Weimar, nor Byron, Greece. And though we have a right to smile at the disproportionate pleasure which Lamartine certainly derived from the accessories of his popularity, his critics are not altogether blameless for the state of things which stimulates such vanity as his. We are too curious in our hero-worship: a mere Washington or Pitt we should think humdrum and commonplace, and yet when a Lamartine at the Hôtel de Ville enters into the spirit of our secret cravings and the impromptu *coup de*

*théâtre* proves a complete success, we are so unreasonable as to complain because, after all, it is—theatrical.

Of Lamartine's old age the less said the better; he wrote for money, and he wrote about himself and his own urgent need for money to avoid the painful necessity of selling the natal soil about which his readers knew so much. What he wrote had little to recommend it, except a slender biographical interest and "cette intarissable et harmonieuse parole" which unfortunately Lady Herbert has not succeeded in reproducing. The *Twenty-five Years of my Life* go over the same ground as the *Confidences*, but are in places a little fuller; for instance, they reveal that Graziella was really a cigar-maker, not a coral-worker, as falsely represented in the romance. But in other respects they are no more accurate or authentic than his other auto-biographical writings. Some of his statements can be checked from the *Memoirs* of his mother, or extracts from her journal published with the *Life*; for instance, it appears that it was in 1819, not, as he describes, during the Hundred Days, that he lodged in an uninhabited fisherman's hut on Lake Lemán with no society save a stray dog and the fisherman's daughter. In Lady Herbert's English, Madame de Lamartine is almost more readable than her son. She was a woman of fine character and some genius, which, however, seldom found its expression on paper, for the journal which she kept regularly was a mere record of domestic affairs, pious resolutions, and ultimately matrimonial negotiations for her daughters. In external circumstances her life was very like that of Eugénie de Guérin, but the care for a whole family, of which Alphonse was one, gives more breadth and variety to the parts of human interest, though on the other hand there is much less of sentiment and poetical reverie in the matron. Another point in which she corrects and supplements her son's reminiscences relates to his first volume of poems. Twenty copies of his *Méditations poétiques*, privately printed and circulated amongst friends, had procured him a considerable drawing-room reputation which preceded by a year and no doubt materially furthered the success of the published volume.

H. LAWRENNY.

#### LITERARY NOTES.

The *Westminster Review* for July contains an interesting article on the Greek lyric poets, characterising with great delicacy and precision the Aeolic school of subjective passion and the Doric school of choral harmony. The writer points out that the latter, though developed within the sphere of Dorian civilisation, was not worked out by Dorian poets. Aeolian passion and Ionic sentiment took possession of the Doric chants, of which the words had previously been bald, childish, and empty, and worked them out into a magnificent literature. The article closes with a rather severe appreciation of Simonides and his successor, Bacchylides, both of whom are considered as somewhat mechanical artists. Pindar is reserved for a separate study.

Under the title, "Eine verjährrte Mystification," Th. Creizenach furnishes the *Allgemeine Zeitung* (July 4) with a very curious illustration of the danger of taking history from newspapers. In the autumn of 1814 Goethe paid two short visits to his native town, and on the last of these occasions, according to both Viehoff and Lewes, a solemn representation of *Tasso* was prepared in his honour. His box at the theatre was hung with garlands, and he himself was crowned with wreaths taken from the busts of Virgil and Ariosto; it was an ovation like that of Voltaire at the Théâtre Français. We are now assured that there is not a particle of truth in the whole story; on the contrary, Goethe visited Frankfurt, and so little honour was shown him in his own country that, to put the town authorities to shame, an enthusiastic admirer of his, Privy Councillor Willemer, invented, wrote, and sent to the *Morgenblatt* (September 28, 1814) a circumstantial account of all that ought to have taken place

at the theatre, but did not. The report was printed in good faith and copied by other journals. The *Morgenblatt* discovered its mistake, and spoke of the forgery (December 31) as an ingenious and successful joke; but, as often happens, the contradiction failed to reach those who had believed and helped to disseminate the false news.

Paul Stapfer, in the *Bibliothèque universelle et Revue suisse*, hazards the opinion that, of all the contemporary historians of France, M. Guizot is the only one possessing a thoroughly healthy mind, sound and happy like an ancient classic. His *Histoire de France racontée à mes petits enfants* illustrates his impartiality and breadth of view, while there is more grace and picturesqueness than in the works of his youth and maturity.

The *British Quarterly* has an interesting article—though written too expressly from a Protestant point of view to be strictly scientific—of William of Occam and his connection with the Reformation. The reviewer considers Occam's originality, though not his influence and importance, to be somewhat overrated: regarding him rather as "the great English schoolman, less qualified to invent theories than to combine and apply to practical use principles already enunciated." Thus he did not so much revive or develop nominalism as popularise it by associating it with the current doctrines of the Byzantine logic (of Psellus). Nor is his theological scepticism, or rather criticism, properly original: he adopted from others the mystical position that the truth of the dogmas is apprehended by faith and not rationally demonstrable: but he deprived this mode of apprehension of its exceptional and hypermystical character by exhibiting it in harmony with his general theory of knowledge: according to which all scientific propositions inadequately represented the truths of intuition, though in theology the inadequacy was greatest. The clear vigour of Occam's anti-papal polemic the reviewer attributes to the union in him of an earnest though moderate mysticism with a practical nominalism. Other writers have attributed to realism a powerful influence in creating and perpetuating the ideas of pope and emperor as the most perfect concrete expressions of civil and spiritual power: here, it is argued, we see nominalism leading to the demand that the symbol should adequately represent the thing symbolized, and so to the attack on the pope as a false representation of Christ's sovereignty.

#### Art and Archaeology.

Photographs of the Acropolis at Athens. By W. J. Stillman.  
Taken with Dallmeyer Lenses. Marion and Co.

A HANDSOME portfolio of twenty-six photographs by Mr. W. J. Stillman will be appreciated by those who have had the happiness to visit the Acropolis of Athens—may go no little way to console others who are now out of hope to do so—they may hasten the more fortunate who have still time and opportunities before them. Well chosen general views give first (5) the northern and most extended aspect of the hill of Athene, confronted boldly by the lower but hardly less renowned hill of Ares—"Mars' Hill"—the Areopagus, and new Athens that the traveller has to endure, below. We move to the right, and in No. 3 the height crowned by the memorial of obtrusive Philopappus becomes visible intermediately in the distance, and now the old Turkish town is before us; a wider detour brings us in No. 4 to the south-east of the Acropolis and the banks of the Ilissus, and Philopappus is now away to our left; the Parthenon nearer to the edge of its enclosure on this side rises clear against the sky, on the slope below it is the great theatre, and on the plain the columns of Jupiter Olympius are brought into view to complete a scene that satisfies the eye by its composition, but can never satiate imagination.

These three views of Athens give the complete circuit of the Acropolis, and combine picturesqueness with an adequate expression of relative distances and magnitude which is far from detracting from the value of the monuments.

From the last general view we can see one direct path to the newly excavated Dionysiac theatre (No. 2); above it are the ruins of the Choric monument, from the summit of which the seated Dionysus, now in the British Museum, looked down on his own theatre; there the beautiful marble chair is still in its place, from which, as we learn by the inscription on it, the priest of Dionysus Eleutherius was a spectator as his god was exhibited breaking the vain bonds of Pentheus and asserting the rights of exalted enthusiasm; or struggling out of a shabby scrape in Hades by now blustering in the disguise of Hercules, now cringing in that of a slave and appealing to his priest among the audience by name to help him as a boon companion in trouble (Arist. *Frogs*).

After a view of a rudely regular entrance to the Acropolis of Roman adjustment (No. 1), recovered by excavations of Beulé, we pass in (No. 6) to the foot of the ascent—once so majestic, now strewn with the ruins of steps and colonnade—the pedestal of Agrippa, the mediaeval watch-tower on either side jostling Attic art and Attic glory; one front of the re-erected naos of Victory without wings is shown on the right—seen more completely in No. 7—in both a symbol of the irony of fate, and yet in a sense an assertion of a tenacity of renown not desperate even yet.

Passing through what once was the western portico and the noble central doorway in the wall that once closed the sacred precinct, we are (No. 8) in the eastern portico of the Propylaea, of which the columns, though shaken, are at least erect. One effect of the shifting of the drums by earthquakes has been to exhibit more distinctly than in other cases their heights and divisions. We observe, in consequence, that in this work of Mnesicles they are unusually numerous—as many as ten in a column of only 25 feet high, against no more than eleven in the Parthenon shaft of 33 feet. The lines of the beds also that are studiously set by Ictinus at different heights in adjacent columns are seen here to rule through the entire hexastyle.

Of the other photographs, five are devoted to the Erechtheum, nine to architectural subjects of the Parthenon, and three to sculptural. Nos. 9 and 18 give the east and west fronts of the Parthenon, with sufficient foreground to convey the proportion of the structure to the circumjacent area; and in No. 17 the eastern is represented again nearer at hand, for the sake of details. Nos. 11, 14, and 13 give views of the cella east and west and northern ambulatory looking west; No. 15 the interior of the portico below; and No. 12, as seen from above—an originally selected view, showing the sculptured frieze that still remains in position and details of construction; the protected and weathered surfaces and peculiar cleavage and fracture of Pentelic marble are given with surprising reality.

Taken altogether, we would scarcely desire a series of photographs to more completely represent the dignity and refinement, the scale and harmony, of the Parthenon and its surroundings. Peculiar interest attaches to photograph 16, which presents the "Profile of Eastern Façade showing the Curvature of the Stylobate"; that is to say, the intentional and studied variation of the lines of the steps from true horizontality—perhaps the most remarkable of the numerous adjustments that the Greek architect imposed upon himself for the sake of countervailing certain slight distortions produced to the eye by contrast of lines. That such was their practice had been read in both Greek and Latin authorities, though the fact was only half believed, the statement perhaps only half understood, until recently verified by the monuments. The publication of Mr. Penrose's minute survey of the Parthenon by the Society of Dilettanti left but sorry excuse for doubt thereafter, though perhaps we have no

right to wonder that the evidence should wait in vain for recognition from architects over-occupied or from theorists committed to the supreme value of zeal however blind no matter—of thought estimated by some gauge irrespective of mastery of the art of effective thinking, or, lastly and latest, of the spontaneous evolution of genius from the crude handicrafts.

The existing fact concurs with the ancient averment, that the Greek observed that architectural lines in certain collocations however truly horizontal in construction failed to appear so to the eye, and therefore intentionally, though at the cost of infinite adjustments, constructed them on a curve to correct the illusion and render them horizontal in appearance. The principle may be illustrated on the smallest scale, and is still more salient to observation in the largest. Inscribe a square within a circle, and the accuracy of the circle seems impaired; it is difficult to regard it as other than a set of segments that would intersect if continued at the angles of the square. By close observation the distortion proves to be shared between the curve and the right line that subtends it; the bow is exaggerated, the straight line sags—dips towards the middle. By a due series of experiments it is found that lines meeting or tending to meet at an angle have their apparent divergence modified; acute angles appear more open, and obtuse less so—the eye in each case approximates the divergence to a right angle. The same occurs therefore in the contrast of an inclined with a vertical line, and had its due acknowledgment from the Greek when he inclined forward the face of an anta that was seen in combination with a column. The difference may be slight, so is that between a sharp note and a flat to some ears; the eye of a Greek, even though not an architect, seems to have been quite as sensitive as the ear of an opera conductor.

There can be no doubt that Mr. Penrose is correct as against Vitruvius in arguing that in the front of a Greek temple the primary compensation was demanded—not on the stylobate, but by the contrast of the raking lines of the pediment with the horizontal cornice—the curvature of the stylobate following in great part as a consequence, though also required independently to countervail the strong contrast of the inclined outline of the angle columns. Abundant exercise for these observations may be found, at least in clear weather, without quitting London, in buildings of all styles. A modern Gothic spire neighboured ill-advisedly by the slope of a high-pitched roof, would seem to have its axis deflected from the perpendicular. Look from the Green Park at the segmental hoods of windows of Bridgewater House that drop on outer ledges of cornice, and these will be seen to turn up visibly like the brim of a hat; the seeming sinking of the cornice was in some degree relieved by the varied lines of sculptured groups, as we may observe in the pediment of the British Museum, but the optical disturbance still is unsubdued.

The stylobate and the cornice must needs be made to appear parallel, and thus the application of the artifice to one would in any case affect—involve—the other. The edges of the steps and the lines of the entablature, usually understood to be straight lines, are therefore in the Parthenon and some other of the best examples of Greek Doric convex curves lying in vertical planes, or, strictly, are composed of straight sides of large polygons, giving approximation to a curve more or less easy according to the number of sides. The front architrave of the Parthenon is composed of only seven stones with six intermediate joints, giving angles that would touch points in a very large circle; the stylobate as composed of twenty-one pieces, or at least of fifteen sets, gives a polygon of more sides; the joints under the two

central columns out of eight are perpendicular; those under the adjacent columns north and south are inclined north and south respectively—coincide, in fact, with radii of the large circle of the general curve. These adjustments are brought out still more palpably by Mr. Penrose's measurements of the lower drums of the columns, which are worked with extremest accuracy, and show the differences in height on opposite sides that must ensue from their lower beds being effectively on a slope.

The total rise above a level line joining the angles of the top step is 0.228 of a foot, or as nearly as may be  $2\frac{1}{2}$  inches. The photograph 16 is taken in very quick perspective, with an horizon at about the level of the second or middle step, and by the rapid foreshortening the rise from the angle to the centre of the steps—required, in the words of Vitruvius, to prevent the line seeming sunk like the bed of a channel—becomes distinctly observable.

We have here a palpable illustration of the words of Mr. Penrose—"The amount of curvature is so exquisitely managed that it is not perceptible to a spectator standing opposite to the front, at least not until the eye has been educated by considerable study, founded on knowledge of the fact. It may indeed easily be remarked by any one who places his eye in such a position as to look along the lines of the step or entablature from end to end."

"Greek art," says Dr. Thirlwall, "is the only art that perfectly satisfies the taste." That this should be so may seem less extraordinary when we appreciate what delicate sensibility and infinite study are implied in adaptations so minute as these, of which the very value depended on their eluding observation.

It is to be desired that some good opportunity may yet occur for investigating the application of these principles to Ionic architecture. The observations of Vitruvius upon them apply, in fact, in the first instance, to this style, and his term, *scamilli impares*, that seems to suit so exactly the "unequal stools" of the diversified lower drums just noticed, is applied by him to stones below the Ionic plinth, and modified for the purpose of effecting, in the first instance, rather than accommodating, the already established curvature. The Ionic temples which have been recovered by the Dilettanti Society since this problem was really appreciated have been too much disturbed by violence and earthquakes for their foundations to supply materials for comparison. Apart from an examination of the Erechtheum directed to the solution of this equally artistic and scientific problem, our hopes must turn to the support of Mr. Wood in his great discovery and the complete uncovering of the mighty podium and stylobate of Diana of the Ephesians.

W. WATKISS LLOYD.

**History of Aesthetic.** [*Aesthetik als Philosophie des Schönen und der Kunst.* Erster Band: Kritische Geschichte der Aesthetik von Plato bis auf die neueste Zeit. Von Dr. Max Schasler.] Nicolai'sche Verlagsbuchhandlung, 1871.

THE period of original speculation in Germany has long been passed, but the productive activity of the national mind has not ceased; it has but taken a fresh direction—it has turned to the labour of consolidating and methodizing the results which have previously been obtained. Throughout the eighteenth and nineteenth centuries a great variety of theories of art have been thrown up. These theories, which have been recreated or remodelled with every fresh turn taken by philosophical speculation, are scattered up and down the works of various writers, sometimes incorporated into the general systems of great philosophers, sometimes occurring in the detached essays of less known men. Dr.

Max Schasler comes in on all this mass of literature, and in the manner of an encyclopaedist reduces the whole to order. He begins with the beginning, *i.e.* with Plato, and carries us up to the latest moment of production. He is indeed not without claim, if not to an original theory, at least to an original point of view, but this will probably be found by readers to be of less value than his historical analysis.

The introductory chapter and the three books which contain this critical history of aesthetic are now before us. They form a complete work, independent of that Philosophy of the Beautiful and of Art which is announced to follow in connection. In the introductory chapter, Dr. Schasler suggests that the history of aesthetic may be divided into three great epochs. First, the period of intuitive (unsystematic) perception; secondly, the period of reasonable system; finally, the period of philosophical speculation. Ancient aesthetic is comprised in the first period; in the second is placed the aesthetic of the eighteenth century; and the third embraces the aesthetic of the nineteenth century up to the present time. In each period, Dr. Schasler again includes three subdivisions of unsystematic, systematic, and speculative treatment. These subdivisions seem to be not only unnecessary and confusing to the reader, but frequently oblige the author to force his facts to correspond to their situation.

After a brief notice of the precursors of Plato, Dr. Schasler proceeds to give full quotations and extracts from the various dialogues. The aesthetic of the Greeks, he says, in its first stage invariably subordinated the Beautiful to the Good. The justification of art lay, in so far as it was serviceable to the Good. Speaking in general terms, this was also the doctrine of Plato, and was carried to its extreme limit by the Cynic and Cyrenaic schools. The next stage commences with Aristotle. In opposition to the Platonic conception of mimesis as mere copying of nature, Aristotle employs the term in the sense of the embodying of the idea, and ranking as such far above reality, which is always more or less incomplete. Mimesis is the cause of the beautiful in art; katharsis its aim and operation. Katharsis is taken by Dr. Schasler in the sense of purifying the emotions, according to the old interpretation, and he does not seem to be aware that this interpretation has been challenged and made at least doubtful by Professor Bernays, who assigns to the expression a totally different meaning. With Plotinus, we enter on the final movement of the ancient period. This movement was based on the tenet of the Alexandrian school that the absolute idea, as the principle of all self-movement, was the source of all being. Plotinus conceives self-movement in respect of the beautiful as the objective embodiment of the ideal: he thus passes beyond the purely subjective signification of the Platonic mimesis, and beyond the Aristotelic limitation to mere artistic activity. For he attains to the higher conception of the objective embodiment in sense after the pattern of the idea. With Plotinus the beautiful is no longer reality to which art has given form, but the idea itself as embodied in reality. The vital element of all existence is the idea as the principle of form; this is the fundamental principle of Plotinus' aesthetic.

After the decay of the aesthetic of the ancients we have a blank of something like a thousand years, resulting from the total change of sentiment respecting art. In that division which marked the development of the middle-age spirit in contrast to the unity which distinguished the ancient, art was bound to spiritual content, and therefore always subversive. The aesthetic interest was absorbed by the theological. With the renaissance movement the yoke was cast off, and art freed went on its way; but not until it had, so to say, run through the whole domain of nature, did the want

arise for a theory of the then complete content. Here commences a new period in the history of aesthetic, which became possible towards the end of the seventeenth century, and the foundation of which was laid by Baumgarten in the middle of the eighteenth. The aesthetic of the English and French at that time, on account of its essentially unmethodical character, can only be regarded as popular, and precursor of the German. After Baumgarten came Winckelmann and Lessing, who freed aesthetic from the pedantic character which marked it under Baumgarten's hands; but it remained for the Kantian school to destroy the narrow limitation to the antique, and, turning criticism to reflection, to deduce speculatively the idea of the beautiful. Fichte gave but occasional attention to the question of art, the arts, and the beautiful, and his philosophy, resting on the principle of purely subjective idealism, was but ill adapted to form the basis of a system of aesthetic. The two Schlegels carried the principle to its fullest consequences, but Adam Müller must be taken as the chief representative of the romantic-aesthetic school. That he makes no sign of anything like real philosophical treatment of his subject is perhaps the best testimony that the romantic school, *i.e.* subjective idealism, had shown itself incapable of a scientific theory of aesthetic. Schelling accomplished the next step when in his *System of Transcendental Idealism* he developed and brought into play the principle of objective idealism. But in aesthetic, as in everything else, he eventually runs off into mere fantastic mysticism, and we find ourselves landed in *Gottesdienst* as the ideal drama. Solger, Krause, and Schleiermacher, without quitting the common basis, took up more important and individual positions, and formed the transition to Hegel. After all, even in the hands of Schleiermacher, objective idealism had not been fruitful as far as any essential advance in the theory of aesthetic was concerned. It had righted the balance between thinking and being in but a clumsy fashion, which left them still a distinct dualism; it remained for Hegel to bring them out of this position of mere polarization into identity. This was done when he proclaimed the Absolute identical source both of the world of nature and of spirit. From this standpoint might be achieved that exact scientific treatment which had before been impossible. Hegel has indeed done more for the subject of aesthetic than any one; and Dr. Schasler, though he fastens on certain evidences of defective method, and lays what seems an almost unnecessary stress on his want of acquaintance with the practical details of the domain of art, confesses that the aesthetic of Hegel is a vast treasure, full of pregnant thoughts and deep insight into the very essence of art. With Ruge, Rosenkranz, and Vischer, closes the list of those Hegelians who have specially busied themselves with aesthetic. Dr. Schasler then makes use of Herbart and Schopenhauer as representatives of a realistic reaction, and concludes by assigning to himself the task of attempting a fusion of the two opposing forces, idealism and realism, in so far as they affect the theory of the arts. This is to be done, he thinks, by taking as sole starting-point the abstract aesthetic idea, and ascertaining first that there exists in the human organism a concrete substratum corresponding to it. By this means, he says, will be avoided the vitiating defect of all previous systems, *viz.* that of starting from pure supposition. Thus closes the first volume, which contains the critical history of aesthetic; the philosophy is, we understand, already written, and will shortly appear in print.

It will be seen from the above that the desire to methodize and co-ordinate according to a preconceived scheme has somewhat fettered the author. The scheme has gradually become a sort of Procrustean bed. Giants are compressed

to fit it; dwarfs are stretched to fill it. Take, for instance, the position which Dr. Schasler assigns to Aristophanes, who, he says, with sound and healthy criticism swept away Platonic cobwebs, and was the precursor of Aristotle. Here the position is forced both critically and chronologically. Then, again, when we come to the modern school, we find undue weight attached to Herbart and Schopenhauer, simply because the scheme demands representatives of realism to set up over against the idealism of Hegel. But to that instinct for completeness and order which has forced the author to submit himself unquestioningly to his scheme is due also the admirable form of this book. In the perfection of method and arrangement, in the thoroughness of treatment, we recognise the same wonderful capacity for organization which distinguished the soldiers of Germany in the field, and which is here brought to bear in a department of literature in which it was seriously needed.

E. F. S. PATTISON.

*Children in Italian and English Design.* By Sidney Colvin. With Illustrations. Seeley, Jackson, and Co.

THIS eloquent essay, reprinted from the *Portfolio*, is a good specimen of that best and most legitimate sort of writing on art which has for its aim the adjustment of a special knowledge of artists and their work to the needs and interests of general culture. Its subject is the treatment of children by Blake, Stothard and Flaxman, as prominent examples of the temper and mode of work of a whole school of English artists three generations ago; and this gives the writer an opportunity of analysing the general characteristics of those three great designers in a very happy and interesting way. His object has been to show that "there exists what may be justly called a modern sentiment towards children and appreciation of them, in a sense in which no such novelty of sentiment or appreciation exists between grown-up people towards each other"; and again, "how that observant home-tenderness, that new, subtle and affectionate intimacy with children, of which Reynolds had first given signs in his portraits of them taken individually, had got to be part of the regular endowment of the age, and had sunk down even into the lightest incidental work and ornament in which its more finely gifted artists revealed their prevailing temper." Sir Joshua Reynolds, notwithstanding the wonderful variety and perfection of his delineation of childish character, is excluded, because in portrait-painting the general temper and sentiment of the artist are controlled by the exigencies of his special function and the necessity of dealing directly with the special and individual traits of the subject in hand; and what Mr. Colvin wishes to seize and analyse is a "type," a "mode of conceiving childhood generally"; and he rightly looks for this in "design of the independent or ideal kind," work which the artist "does out of his own head," like the designs in Blake's *Songs of Innocence* or Stothard's illustrations of books.

In the chapter on Blake, which is illustrated by two plates full of that peculiar mingling of sweetness and strangeness which characterise the work of this great artist, he dwells at length on the original of the *Songs of Innocence*, the text of which has been lately reprinted, bringing clearness into the bewildered beauties of that singular *melange* of design and verse. Afterwards, illustrating what he says here, as in other parts of his book, by vignettes introduced with pleasant effect into the printed page, he defines a certain affinity between Stothard and Blake, two artists at first sight so incompatible or contrasted, lingering pleasantly over the *rapprochs* of Stothard with his time, and giving some interesting details on the early history of English engraving, showing

by many incidental indications and a well selected epithet here and there an unusual knowledge of that perplexed subject, the general history of English art; seeing these things always in close relation to the artists who produced them, and those artists themselves in close relation to their times. "Stothard's age," he says in a characteristic passage, "and its ways in England had enough charm in them to have become pleasantly ideal to us, in the sense in which it takes something more than mere lapse of time to make an age ideal; and he, like the stronger souls between whom we have set him, was a votary of the ideal within his age itself; he knows how to add the necessary touch, to accent or generalise the costume, to find grace in frilled shirts and large lappets, and knee-breeches and stockings, to sweeten and dignify the type, to group and harmonise the figures just within the fitting measure. And in his landscape and accessories he makes just the abstraction required by the pitch of the subject and the conditions of the scale and material. Stothard was a real student of outer nature both in general and detail (his tender passion for flowers is one of the prettiest things which Mrs. Bray, his daughter-in-law, tells about him in her *Life*); and his miniature landscapes of hill, lake, park, garden, and woodland, or cottage and thicket, have the elements which speak most directly to the quieter side of the landscape faculty in us."

And the same skill with which Mr. Colvin has struck upon the remote affinity between Stothard and Blake is shown in the passages in which, on the other hand, he distinguishes the qualities of Stothard from those of Flaxman—designers who have so much in common, and whose qualities for the superficial observer so easily fade into each other—thus discriminating admirably those three distinct faculties. "Unlike Stothard, Flaxman works in an atmosphere, above that of historical or romance associations, in which ancient and modern are reconciled under an almost identical ideal," presenting this ideal "in a mode which I have called architectonic," the limbs of his figures "being conceived as masses for adjustment in something like rigid geometrical or architectural figures." The frontispiece of the book is a design of Flaxman's photographed from an example in Mr. Colvin's own possession—a design quite monumental and grand, though worked out with a few simple lines and tints; and on page 46 he suggests in a few words altogether worthy of it what he thinks may be the meaning of this design.

And by way of further defining, through contrast, that exact phase of sentiment in the treatment of children by English artists which he wishes to discriminate and explain, he has prefixed some notices of the very different treatment of children by the Italians of the middle age and the Renaissance, artists who saw in children not their common human relations, but referred them "to other and more remote relations suggested by religion and imagination," looking for supernatural or symbolical types in them, so that "the burden of the supernatural which," as he well says, "is always in some degree the unnatural rests inevitably on all their delineation of them." Here too Mr. Colvin shows an equal knowledge and appreciation of a kind of art so different from that of England in the Georgian era, unravelling distinct threads of feeling here also, and showing how to a true culture workmen so far apart as these early Italians and those later Englishmen suggest no incompatible interests, but with full congruity lie easily enough together in that *House Beautiful* which the genuine and humanistic workmen of all ages, all those artists who have really felt and understood their work, are always building together for the human spirit.

It will be seen from what has been said that although this book is of no great length yet it ranges over a great

variety of subjects. And out of all this Mr. Colvin has untwisted with singular skill this one particular thread of the treatment of children, presenting only what he feels clearly and can present with true effect. Thus the little book has a real unity, touching on many diverse things, but kept together by its main thread, so that it might easily be expanded into a larger volume. Such work is only possible where there is great general knowledge of art. Instances of this general knowledge are everywhere scattered up and down this essay. Mr. Colvin gives us, for instance, by the way, on page 16, a clear characterisation of that obscure artist, Honoré Fragonard, and does an act of historical justice in passing. But this true knowledge in aesthetics is shown best of all by the impression he gives one that in passing over so many phases of art he seizes a fresh *nuance*, a fresh variety of impression and enjoyment from each; you feel that beyond mere knowledge, mere intellectual discrimination, each one of them is a distinct thing for him, and yields him a distinct savour.

WALTER H. PATER.

### ART NOTES.

The incompetence of those persons who think themselves competent to furnish the public with translations from the German is as manifest as ever. Any one who has blundered through Schiller's *Thirty Years' War* and a couple of plays of Kotzebue's thinks himself qualified to translate every author on every subject. A flagrant example of this state of things is furnished by the translation of German essays which has been lately given to the world by Holzendorf and Virchow as the *German Quarterly Magazine*. The first number for 1872 contains, amongst other articles, one on Albrecht Dürer, by Dr. Hermann Grimm, the well-known author of the *Life of Michel Angelo*, whose *Select Essays* were recently reviewed in these pages (*Academy*, vol. iii. pp. 124, 125). Dr. Grimm had not the opportunity of seeing the translation before it appeared in print, and now—too late for alteration—he finds that not only is the entire essay badly translated, but that it is full of passages in which the author has been completely misunderstood, and has the most ridiculous and absurd statements put into his mouth. Here is one specimen: Dr. Grimm writes, "Deutschlands grosse Männer sind niemals gross gewesen durch das, was sie leisteten im engeren Sinne." This statement the translator gives us as "Germany's great men have never been narrow-minded." And after this fashion, on every page, occur some four or five bits of egregious nonsense. "One more perversion," says Dr. Grimm, in a letter now lying before us, "is especially annoying to me,"—"such an opinion upon Buckle, Englished in such an incomprehensible and incorrect fashion, that it is utterly impossible to make out from it what I intended to say."

The Berlin sculptor, Johannes Pfuhl, has just finished his colossal marble statue of Baron von Stein. The commission was bestowed on him about four years ago, when he obtained the first prize for his design in public competition. The statue has been exhibited to the public in the atelier, and was unveiled on July 9.

Dr. W. Rossmann, who is widely known by his talented book of travels, *Vom Gestade der Cyklopen und Sirenen*, has been named professor of art-history and aesthetics to the art-school in Weimar.

Some works undertaken in connection with the construction of a new street at Lucera have brought to light a statue of Venus, a marble vase, and portions of a mosaic pavement. The Venus is about seven hands high, and is undraped; at her feet are a child and a dolphin. The figure is broken, but no piece is wanting, and the Italian papers speak of it as good work, without assigning any date. The vase bears the inscription: "Divo Commodo." The authorities have undertaken to carry on the excavations, and there is every likelihood of their being richly rewarded, for Lucera is the ancient Luceria, and the soil teems

with antiquities. The chief ornaments of the cathedral itself (originally a mosque built by the Saracens) are the columns of verd antique, which come from the temple of Apollo once standing on the same site. Many pieces of sculpture and Roman inscriptions have already been found within the area of the ruined castle, which stands about a quarter of a mile distant from the city itself.

An interesting contribution to the literature of household art has recently appeared in Felix Lay's *Südslavische Ornamente*. The book is published by Fischbach in Hanau, and contains twenty careful chromolithographs of carpets, needlework, articles of jewellery, &c., all of South Slavonian design, and is accompanied by an explanatory and critical text.

Mr. J. Tattersall's collection of modern pictures and a valuable collection of pictures and water-colour drawings were disposed of on Saturday, July 6th, by Messrs. Christie, Manson, and Woods. The collection was especially rich in the works of David Cox. The following are some of the most important: five sketches in sepia, 135 guineas; three drawings in water-colour ("Harbourne Lane," "Watering Horses," "Ploughing"), 140 guineas; two drawings ("A Hayfield," "Cader Idris"), 110 guineas; "Greenwich Hospital," with boats and figures, 105 guineas; two views on the Welsh coast, 100 guineas; "Milking Time," and "Looking up the Vale of Meawrog," 108 guineas. All these were by Cox, but upwards of seventy-five sketches and drawings by this artist were sold. R. P. Bonnington, "The Rialto," 135 guineas; "River Scene," 115 guineas. Amongst Mr. Tattersall's pictures may be mentioned: "Highland Landscape," by Cooper, 138 guineas; and "Mountain Spring," by Poole, 145 guineas. On the same day a couple of examples by Courbet, "The Forest," and "Female Figure," fetched 180 guineas; a small river scene by Constable, 75 guineas; Vandyke's portrait of Judge Morton, exhibited in 1866 at the National Portrait Exhibition, 165 guineas; Sir Joshua Reynolds, "A Girl Sketching," from nature, 145 guineas; Nasmyth, "View on the Thames," 170 guineas.

#### RECENT WORKS ON CHEMISTRY.\*

[FOURTH ARTICLE.]

- XI. The Rock Salt Deposits of Stassfurt. [*Ueber die Steinsalza-blagerung bei Stassfurt*. Von C. Reinwarth.] Dresden: G. Schönfeld, 1871.
- XII. Organic Chemistry and Materia Medica. [*Die organische Chemie und die Heilmittellehre*. Von A. W. Hofmann.] Berlin: August Hirschwald, 1871.
- XI. THIS short monograph is by one who may almost claim to be the discoverer of the Stassfurt Salt Deposits.† A residence at that place so long ago as 1838 enabled him to study the geologic features of the country on the northern side of the Harz, and to ascertain what likelihood there was

of salt existing there. The attention of the Prussian government having been drawn to the matter, borings were made, and salt was found. Numerous researches, geological, chemical, and technical, subsequently led to the utilisation of the potassic compounds found in the deposits, and thereby to a great extension of the mines. In 1868-70 Reinwarth revisited the place, and acquired a knowledge of the work carried on. His observations he has embodied in this pamphlet, of which the following is an abstract.

Stassfurt, which formerly was a small agricultural village with a little saltwork, is situated some twelve miles to the south-west of Magdeburg. The formation on which it stands is the "bunter Sandstein," and consists of red and micaceous slates, beds of oolite, and large deposits of red clay with gypsum and anhydrite. There are very extensive beds of brown coal and several salt springs.

The first borings were made in 1839, when there was obtained a substance containing much magnesian salts, and it was not till after piercing this layer that rock salt was reached. This layer, containing salts of magnesium and potassium with gypsum, was for the time viewed as worthless, and was called "Abraum" salt. In 1851 two shafts were sunk—one in Prussia, the other in Anhalt—and in 1857 mining operations were started.

The whole salt deposit is upwards of 1300 feet thick, and consists of four groups, or regions. 1st. The lowest is the rock salt, which is compact, crystalline, and transparent. Sometimes it has a greyish colour, and it contains isolated cubes of a bright blue tint. The deposit is uniform, but it is divided into layers by very thin threads of anhydrite, which are supposed to indicate the successive depositions of salt which have occurred. In commerce the salt, according to its appearance and purity, passes under different names. It contains from 95-96 to 98-99 per cent. of common salt, the chief impurities being the potassic and magnesian chlorides and calcic sulphate. Organic matter is apparently absent, but gaseous hydrocarbons have been found in cavities in the upper layers. It is largely used, of course, for household purposes, but it is likewise consumed in fish-curing, agriculture, cattle-feeding, soda and glass making, and so on. The 2nd is the polyhalite group. Common salt predominates, but there is a notable quantity of salts of magnesium, calcium, and potassium; otherwise this group has no marked characters. The 3rd is termed the kieserite region (after Kieser, the president of the Berlin Academy), and it consists principally of magnesian sulphate with one molecule of water of crystallization, mixed with salt and carnallite. The main feature of this region is this abnormally hydrated magnesian sulphate. 4th. The Abraum salt—which has now become the most interesting of the whole, both chemically and industrially—consists mainly of carnallite, a double chloride of potassium and magnesium, which occurs both of a white and red colour, and contains traces of other salts and brilliant scales of micaceous ferric oxide. Several minerals have been found in this region: for instance, sylvin, native potassic chloride; kainite, consisting of potassic chloride and magnesian sulphate; tachydrite, a yellowish deliquescent double chloride of calcium and magnesium; stassfurtite, magnesian borate, a heteromorphous form of boracite, under which name, indeed, this mineral was formerly erroneously known.

Having described the four regions, the author devotes the rest of the paper to an account of the potash industry, which, from the extent of Abraum salt disclosed both in the Prussian and Anhalt workings, may be hereafter developed to an almost unlimited extent. The Anhalt deposit is characterized by the quantity of kainite, which is found above the carnallite. This substance is used partly crude and partly calcined for

\* See *Academy*, vol. ii. pp. 455-458.

† Leonhard und Geinitz, *Neues Jahrbuch für Mineralogie, Geologie und Palaeontologie*, 1871, p. 325.

spreading on the fields; and it is also used for preparing pure potassic sulphate.

The chief Stassfurt manufacture, however, is of potassic chloride. The raw material from the mine contains 50 to 60 per cent. of carnallite, 10 to 15 per cent. of kieserite, and 25 to 30 per cent. of rock salt, and the operation is based upon the superior solubility of the carnallite. When, accordingly, the raw substance is treated with warm water insufficient for complete solution, the carnallite is dissolved mainly. This solution on cooling deposits chloride of potassium and sodium. The mother-liquor on evaporation gives chloride of sodium, and double sulphate of magnesium and potassium, and the liquor from this by concentration chloride of potassium, or artificial carnallite. By greater concentration more carnallite is got, which on treatment like natural carnallite yields very pure potassic chloride. The strong solution that remains consists chiefly of magnesian chloride and bromide, and is employed for making pure magnesian chloride and bromine.

The residues, mentioned above, of kieserite, anhydrite, and rock salt, are utilised in various ways; crude and purified sulphate of magnesium are made, and chloride of magnesium. These salts are said to be largely used in this country in finishing light cottons and increasing their weight; magnesian chloride has been applied to artificial stone making, to extinguishing fires, and for other purposes. Bromine also is produced to the extent of 30,000 kilogrammes (about 30 tons) per annum (p. 22).

The potassic chloride, got from the carnallite as above described, is recrystallized, by which the percentage is raised to 95–98, but usually only 80 per cent. is supplied. This salt is largely consumed in preparing saltpetre, by double decomposition with nitrate of sodium. Potassic carbonate is also made from it by Leblanc's process, and quantities are used in soap-boiling, bleaching, the glass and alum manufactures. It is also used to a very large extent not only on the Continent and in this country, but even in America, as a fertilising agent. This branch of the manufacture has extended with the knowledge that potassium exercises a marked influence upon certain crops, and is indeed absolutely required by them.

At this point the author indicates a difference of which the agriculturist would do well to take heed, that, namely, between the amount of potash actually contained as potassic sulphate in a potash-manure and the amount of potassic chloride equivalent to a certain amount of potash (pp. 29–31). The manures prepared at Stassfurt, which are advertised under a great variety of names, and are recommended for as great a variety of crops, are either simply potassic salts (chloride alone, sulphate alone, or a mixture) more or less pure, or are phosphatic or other manures to which a certain proportion of potassic salts has been added. The consumption in this way, as has been already remarked, is considerable; of 270 million kilogrammes (not quite 270,000 tons) of potash salts raised in 1869, 25 to 30 million kilogrammes were made up for manures, and the quantity will in all likelihood increase.

The author discusses (pp. 35–39) the tax on salt and its influence on the whole industry. He points out how heavily it presses upon those least able to endure it, and how it prevents the Stassfurt salt from competing with the English. In the case of salt for cattle-feeding or for manufacturing purposes the tax is removed, but the salt by mixture must be rendered unfit for domestic use. The regulations on this point are strictly enforced, and when salt is sold the use for which it is intended must be stated in writing (p. 38).

The demand for potassium compounds is increasing rapidly every year, and there are some twenty works in full

operation at Stassfurt, following different methods for extracting the chloride and preparing the different salts. The usual indications of a manufacturing district are obvious: chimneys, smoke, railways, dense population, no vegetation; and the bright material side of a great industry in full glow. But the author mentions that there is also a dark side (p. 21).

This paper being occupied mainly with the industrial question alludes only incidentally to the manner in which the deposits have been formed. The generally held view is that the salts have solidified from a slowly evaporating salt lake, and that the order of deposit represents the different solubilities of the salts; the least soluble rock salt depositing first at the bottom, and the Abraum salt, consisting of the most soluble salts which crystallized only when the water had evaporated completely away, existing of course at the top. The Stassfurt basin appears to have been nothing else than a great salt pan, and some of the double salts found in it have been obtained by careful evaporation of sea water. But while this view may be on the whole correct, there are questions, to answer which it does not attempt. The formation of stassfurtite, for example, which is found in isolated masses distributed irregularly, is not understood, and the production of kainite must have been effected under conditions which have not as yet been imitated in the laboratory.

Other deposits containing potassium exist in other parts of Europe, and in particular at Kaluscz, in Galicia. From a variety of circumstances, however, operations at these places have not become so extensive as at Stassfurt, so that in the meantime the main supplies of the potassium compounds come from the great Magdeburg basin.

XII. On the 2nd of August last, the anniversary of the foundation of the Medico-Chirurgical Friedrich-Wilhelm Institute and Military Medical Academy in Berlin, Dr. Hofmann delivered a very clever address, taking as his text the services to *Materia Medica* rendered by Organic Chemistry. The author begins with tracing the boundaries of organic chemistry as they at present exist. It is shown that, while the chemical elements seldom form more than two to five compounds with each other, there is a prominent exception in the case of carbon and hydrogen. Of these two elements, not only a very large number of compounds is known and described, but from the knowledge gained by their study it would appear that there is hardly a limit to the number of possible hydrocarbons. Among those known are bodies, solid, liquid, gaseous, of the most varying physical and chemical properties.

Into these hydrocarbons other elements, oxygen, chlorine, nitrogen, &c., can be worked in a variety of ways and with the production of changes the elucidation of which is at present the chief task of chemistry. So much has been achieved as to enable chemists, with some amount of certainty, to forecast the changes and to anticipate the constitution and properties of bodies resulting from a reaction.

The interest in these hydrocarbons and their derivatives is much heightened when it is known that it is of them mainly that a great part of plants and animals consists. Thus the hydrocarbons are combustible, and yield as products carbonic anhydride and water. So, too, do plants and animals. From this circumstance the hydrocarbons and their derivatives were called organic, it having been by the study of organisms that chemists first became acquainted with them. At first, discoveries were rapidly made, but inability to produce even the simplest compounds found in an organism led to the supposition that these bodies were of a kind and were the effects of forces differing from any that could be imitated by art. This view, however, has now changed, and bodies which were formerly obtainable from

plants or animals alone can now be fabricated by the chemist, who has at his disposal only the elements composing them.

Still, while the earlier partition-walls which were raised between organic and inorganic chemistry have almost entirely disappeared, the remarkable properties of the carbon compounds will continue to separate them from other bodies and to demand separate study and treatment.

Having thus displayed the compass and nature of organic chemistry, the author next recapitulates the services rendered by it to *materia medica*.

The first step in the progress of organic chemistry was the result of improved methods of analysis. By a more skilful use of solvents, for example, complex mixtures were separated into proximate constituents, better defined in form, composition, and properties. Belonging to this stage is the separation from opium of morphia and other bodies, of prussic acid from bitter almond oil, of valerianic acid from valerian root. Of these *materia medica* took possession. Soon, however, came a change in the mode of investigation. The definite proximate principals themselves were subjected to the action of the most powerful chemical agents, under varying conditions of time, concentration, and temperature, and thus entirely new bodies were got. During this period other alcohols were discovered, and one of these—amylic alcohol—was found in the distillers' residue called fusel oil. It had been found that spirit of wine and wood spirit, by oxidation, yielded each an acid; and amylic alcohol was subjected to the same action. How great was the surprise when it was found to be identical with valerianic acid got from the root. This was a boon to *materia medica*, for so long as the root was the only source, the acid was scarce, but when it was found that it could be derived from a fluid, to be rid of which most speedily was the aim of the distiller, the acid was at once prepared on a large scale, and converted into the valuable zinc and bismuth valerianates. Similar instances, described at length by the author, are afforded by lactic acid, now got from sugar, succinic acid, from malic acid, and benzoic acid, manufactured from hippuric acid. There are natural products, too, such as oil of mustard, which are prepared now, not from their native sources, but artificially, by the reactions which the study of their constitution in the laboratory has shown will produce them; and it is likely that with the progress of synthesis drugs got hitherto only by analysis and in small quantity will be fabricated extensively from their proximate constituents.

In the preceding instances, the gain to *materia medica* lay, not in absolutely new bodies discovered, but rather in the methods by which bodies already known and used could be obtained more abundantly. Absolutely new bodies, however, gradually came to light, and a rich crop of these has been yielded by the method of destructive distillation, a method which has largely extended the field of organic chemistry. In particular, two of these bodies, creosote and carbolic acid, have proved of the greatest value in surgery and hygiene.

The next stage was that of substitution. The effect of strong nitric acid in decomposing complicated bodies was tolerably well understood, but cases had been observed in which the new products were not simply oxidized, but contained nitrogen derived from the acid. Hence, for a time, every substance was subjected to its action, and many important compounds were discovered—nitrobenzol, picric acid, xyloidin, gun-cotton (to which the author might have added nitroglycerin). From gun-cotton, collodion has been prepared, which, in so far as it is used in surgery, is a contribution to *materia medica*.

Of more importance than nitric acid as a means of transforming bodies is chlorine, the effect of which has been examined with great minuteness. Of the almost countless bodies containing chlorine, chloroform and chloral are for the physician of the highest interest. The author describes the discovery of these bodies and of their properties at too great length for us to follow. He points out the purely scientific discovery of the properties of chloral, and shows that Liebreich's was one of the comparatively few instances of a discovery made deliberately. Its success is evinced by the fact that, whereas previous to its medical application not more than two or three pounds in all had been prepared, chloral hydrate is now manufactured in Berlin alone at the rate of a couple of hundred pounds every day.

A further extension of the doctrine of substitution has produced equally remarkable results. Bodies have been found to change entirely their physiological properties by the addition of one or more elements, or even by a change in the way the elements are combined. For instance, antimony in its tartrate is emetic, and arsenic in its oxide and hydride is highly poisonous, whereas the stibonium compounds and cacodylic acid have lost these properties. Still more recently there has been described a remarkable change of properties in strychnine and other alkaloids by the substitution of part of their hydrogen by methyl.

These are subjects of almost unlimited extent, which hitherto have attracted almost no notice. What the tendency is to be is obvious. Just as in dyeing different colours are now attained, not by mixtures, but by changes in the constitution of the colouring matter itself, so physiological effects will come to be produced, not by a mixture of drugs, but by a change in the constitution of the substance.

This address is an ingenious blending of historical development of chemical ideas and methods with a matter-of-fact account of one of the economic applications of them. At first it appears a simple and perhaps even apologetic statement of facts; but attention discloses an under-current of argument which is none the less powerful that it is marked. It contains, indeed, a tacit protest against the maintenance of a supposed difference or antagonism between scientific and technical chemistry. Very clever, too, is the manner in which the author at starting gets rid of the encumbering epithet "organic," and yet avoids the phrase "carbon," chemistry, though it be by a sacrifice, or at least an inversion, of the whole history of the subject. Into this we have not space to enter. The address will be found worthy of perusal.

JOHN FERGUSON.

### *Notes of Discoveries and Scientific Work.*

#### *Chemistry.*

**The Meteorite of Ibbenbüren, Westphalia.**—This stone was seen to fall on the 17th June, 1870, its descent being attended by the usual phenomena of light and sound. A fragment became detached at the time, and was found between three and four hundred paces from the aërolite. The latter weighed about two kilogrammes, had a density of 3.4, and was covered with a uniform black crust. It was recently examined by Prof. Vom Rath, who has communicated his results to the Berlin Academy (*Der Naturforscher*, No. 19, 1873). The mass of the stone is white, or of a greyish-white colour, and encloses numerous crystalline granules, having a pale yellowish-green hue. The two constituents are identical in composition, being a bronzite ( $(\text{MgFe})\text{SiO}_3$ ). The meteoric bronzites are distinguished from terrestrial species by their large proportion of iron oxide. We are now acquainted with four meteorites each consisting of a single silicate: the Chassigny stone, of olivin; the Bishopville meteorite, of enstatite; and those of Manegaum and Ibbenbüren, of bronzite.

**Aldol.**—Wurtz has announced the discovery of an organic compound exhibiting at one and the same time the properties of an alcohol and an aldehyde (*Revue scientifique*, No. 49, 1871). With acetic acid it forms an acetic ether like aldehyde, while with nitrate of silver it produces a

metallic mirror. The new body, which is regarded as belonging to a type differing from those already known, is formed by the action of a mixture of water and hydrochloric acid on methylic aldehyde at a low temperature. After the lapse of eight days the liquid is to be neutralised, extruded with ether, and after the removal of this solvent by evaporation, the residue is to be distilled in vacuo. In this way a colourless liquid is obtained, which in about twelve hours acquires the consistence of thick syrup of sugar. According to more recent information (*Ber. Deut. Chem. Gesell. Berlin*, No. 11, 533), the new alcohol possesses the composition  $C_4H_8O_2$ , and has a density of 1.1208 at  $0^\circ$ , of 1.1094 at  $16^\circ$ , and of 1.0816 at  $49^\circ 6'$ . Its co-efficient of refraction is for the sodium line 1.458. If aldol be heated to  $100^\circ$ , with three times its weight of anhydrous acetic acid, two acetides are formed; one boils in vacuo at  $100^\circ$ , and has the composition  $C_4H_7O(C_2H_5O_2)$ , the other passes over between  $150^\circ$  and  $160^\circ$ , and appears from analysis to agree in composition with diacetate of crotonaldehyde,  $C_4H_7(C_2H_5O_2)_2$ . Nitric acid oxidises aldol with great energy, forming oxalic and other acids which have not as yet been investigated. Phosphorous pentachloride acts on aldol with great violence, and converts it into a chloride,  $C_4H_7Cl_5$ , that undergoes decomposition by distillation, forming hydrochloric acid, and, it is probable, the chloride of crotonaldehyde,  $C_4H_7Cl_2$ . The ether of aldol,  $(C_4H_7O_2)_2O = C_8H_{14}O_5$ , boils, under a pressure of 2 cm., at  $137^\circ$ , and separates from water in crystals that melt at  $155^\circ$ . Both aldol and its ether act very powerfully on Fehling's copper solution. When treated with dilute hydrochloric acid or nitric acid, aldol breaks up into water and crotonaldehyde and some resinous products. Wurtz directs attention to the important part that methylic aldehyde probably plays in vegetation in respect to the production of certain substances met with in plants. He shows that methylic aldehyde may arise from a partial reduction of carbonic acid:

of which several molecules may, by a condensation analogous to that observed in ethylic aldehyde, produce bodies that in several cases are alcohols, and in one aldehyde. Carbohydrates are instances of this.

**Zeunerite.**—A. Weisbach, in a letter from Freiberg, published in the *Fahrbuch für Mineralogie* (part ii.), states that the supposed chalcolite accompanying the new minerals trögerite and walpurgine, recently found in the Weisser Hirsch Mine of Neustädte, is likewise a new mineral species. It completely resembles chalcolite as regards lustre, hardness, colour, crystallization, and cleavage, but differs from it in density, the latter approaching 3.2. Zeunerite contains no phosphoric acid, and varies from chalcolite in containing arsenic acid in the place of that acid. The mean of two analyses according with the formula

that of chalcolite being

**Heterogenite.**—Under this name A. Frenzel describes (*Journal für prakt. Chem.* No. 9, 407) a new mineral occurring with lithiophorite in the Wolfgang Meessen Mine at Schneeberg. It is an amorphous substance of a black or brownish-black colour, has but little lustre, and forms uniform masses; its hardness is that of calcspar, and it has a specific gravity of 3.44. It has a composition corresponding with the formula  $CoO, 2Co_2O_3, 6H_2O$ . It was at first taken for asbolan, but contains too small a quantity of manganese for qualitative determination. Associated with it are pharmacolite and a red-coloured calcspar.

**Ozone.**—It has been observed by Prof. H. H. Croft, of University College, Toronto (*American Jour. of Science*, June, 465), that a syrupy solution of iodic acid, prepared by Millon's method, if evaporated over sulphuric acid, emits a strong odour of ozone as soon as crystals begin to form. The experiment has been made repeatedly, and no change is noticed when a few crystals begin to form, but the strong smell of ozone is noticed as soon as the crystallization has fully set in. Mr. Sterry Hunt, by way of accounting for this phenomena, ascribes it to a partial deoxidation similar to that which produces ozone when permanganates are decomposed; the author, however, considers this explanation insufficient.—L. Casius has determined (*Ber. Deut. Chem. Gesell. Berlin*, No. 11, 520) the co-efficient of absorption of ozone by water. Ozone was formed by Soret's method, and passed through water for two hours at temperatures from  $0^\circ 5'$  to  $3^\circ$ . The water at the end of this time possessed in a high degree the characteristic odour of ozone. Potassium iodide turned it brownish-yellow—an excess of the water easily destroying the colour and converting the iodine into iodic acid, while litmus and indigo are readily bleached. A solution of thallium oxide soon deposited brown flocks of peroxide. Silver leaf remains unchanged in ozone water for any length of time, provided it be entirely immersed in the liquid; if any air be present, peroxide is formed, and the smell disappears. According to an examination made by Bunsen's volumetric method, 1000 cc. of water take up in addition to oxygen from four to five cub. cent. of ozone.

**The Inorganic Constituents of Blood.**—An elaborate paper, treating this question, and containing the results of many analyses made by the author in the laboratory of Prof. Stricker, is published by A. Jarisch,

of Vienna, in the *Ann. der Chemie*, June, 1870, 236. A mean of four analyses of the blood of the dog gave the following number as constituents of 100 parts:—

Phosphoric anhydride . . . . .	0.1103
Sulphuric anhydride . . . . .	0.0358
Chlorine . . . . .	0.2805
Potash . . . . .	0.0342
Soda . . . . .	0.3748
Lime . . . . .	0.0112
Magnesia . . . . .	0.0058
Iron oxide . . . . .	0.0048

A paper by Boussingault was read before the Academy of Sciences (*Revue scientifique*, No. 49, 1171) on the constant presence of iron in the tissues. He finds that the flesh of a large species of snail contains about the same amount of iron that is found in beef, the former being 0.0036 per cent., the latter 0.0048 per cent. The white blood of Mollusca contains, he believes, about the same amount of iron as the red blood of Vertebrata.

### Zoology.

**The Sense of Sight in Birds.**—Dr. R. J. Lee has come to the conclusion (*Proc. Roy. Soc. May*) that in Birds perfection of sight depends on the power of accommodation of the eye to distance and on the development and character of the ciliary muscle: a conclusion which is supported by M. Tegetmeier's observations on pigeons. He expresses a belief that "homing," as it is termed, in the Antwerp pigeon is the result not of instinct, but of observation. These pigeons have to be trained stage by stage, or they are certain to be lost. The best of them refuse to fly in a fog or in the dark. They seek in new localities some known landmark, and their gyrations gradually increase till they descry some familiar object, when they recollect their route and fly straight ahead. The objection that no pigeon can possibly see two hundred miles ahead is in direct opposition to aeronautic experience, Mr. Glaisher, at an altitude of half a mile, having been able to trace the course of the Thames from the Nore to Richmond.

**Recent Fossil Man.**—In the *Popular Science Review* for July, Prof. Morris gives a short report on the recent discovery of a sub-fossil human skeleton in a cave in the south of France, with some introductory remarks on the few cases in which the remains of man have been found associated with those of extinct animals. The most recent discovery was made early this year in one of the great caves (Baoussé-roussé) of the Italian frontier (near Mentone), by Dr. E. Rivière. The skeleton, which is that of an ordinary-sized man, is entire, with the exception of the ribs that have been broken by the pressure of the superincumbent soil. The legs crossed in a natural position, and the arms folded near the head, seem to indicate that the man to whom they belonged died during sleep (?), and that his remains were carefully covered over without disturbing the earth beneath. Mr. Moggridge believes that it is an instance of interment during the stone age, and late in that period.

*Note sur les Singes fossiles trouvés en Italie, précédée d'un aperçu sur les quadrumanes fossiles en général.* By Forsyth Major.—Some fossil remains of monkeys found in the valley of the Arno, and of Pliocene age, are considered by the author to have belonged to a species closely allied to, if not identical with, the monkey still found living on the rocks of Gibraltar (*Macacus inuus*). A mandible discovered at Monte Bamboli, in Tuscany, is referred by Gervais to the genus *Cercopithecus*. Fossil remains of monkeys are extremely rare; in Europe they have been found only at the following localities: Woodbridge, Suffolk (the Eocene *Eopithecus*); Würtemberg, Swiss Jura, Zürich, and the south of France (Montpellier).

**Ceratodus.**—An abstract of Dr. Günther's papers on this fish appears in the *Popular Science Review* for July, with addition of some later observations. The author draws attention to the remarkable fact that the Ganoid family of *Sirenidae* coincides, as regards geographical range, with the Teleosteous family of *Osteoglossidae*, and shows that representatives of both these natural families, which externally are so similar and structurally so dissimilar to each other, are found in the same freshwaters of the tropical regions of America, Australia, and Africa. It is only in the East Indian Archipelago that the Ganoid representative of the Teleosteous *Osteoglossum formosum* has not yet been found. *Osteoglossum formosum* has hitherto been met with in Sumatra, Banka, and Borneo; and as scarcely anything is known at present of the inland fishes of the latter island, the author thinks it highly probable that a Ganoid fish may be discovered there.

The *Bulletin de la Société impériale des Naturalistes de Moscou*, vol. xlv. Nos. 3 and 4, contains the following zoological papers: 1. J. Borsenkow, On the Development of the Ovary of the Fowl, and its development during the first period of life; pp. 11–60. 2. J. H. Hochhuth, Enumeration of Coleoptera hitherto found in the Russian provinces of Kiev and Volhynia (continued); pp. 85–177. 3. L. Sabanéef, Catalogue of the Mammals, Birds, Reptiles, and Fishes of the Middle Ural; pp. 210–278 (written in Russian). 4. Chaudoir, Remarks on the Catalogue

of Harold and Gemminger; pp. 279-287. 5. H. Trautschold, On the Primogeniture of Trilobites. The last paper is polemical, and directed against Barrande, who, in his work, *Les Trilobites* (1871), showed that the appearance and distribution of the first organisms in the strata of the primordial era is decidedly opposed to the Darwinian doctrine. He maintained that the lowest organisms do not precede more highly organized animals, and more especially that the higher Trilobites existed long before the lower Cephalopodes and Acephales. Trautschold's case against Barrande is based on the following arguments: 1. The fact of our not finding *Foraminifera*, with the exception of the very doubtful *Eozoon*, *Acephala*, &c., or their representatives, in strata where we should expect them, cannot be taken as a proof of their non-existence, since the sea-water in which they lived differs to a great extent from the salt-water of the present period in its chemical composition, containing a far less quantity of salts; and it consequently follows that those animals were probably not provided with hard shells, which alone could have been preserved. 2. A striking example of the gradual change of animals in the progress of time is afforded by the fossil shells of a high sea cliff near Kertsch, where it can be demonstrated that the forms of *Cardium* in the higher strata are the descendants of those having very different shells in the lower. 3. It is difficult to suppose organisms living under constantly varying conditions should undergo no change. Every kind of organism has a limited period of existence only; some, being unable to survive a change of external physical conditions, perish; others, according to their innate power of accommodating themselves to such a change, or according to the more or less favourable conditions of their surroundings, are developed into lower or higher forms. Low and high organisms will consequently be found in association at all times and in each horizon.

We regret to have to record the death of two eminent zoologists. Dr. William Stimpson, Secretary of the Chicago Academy of Sciences, the indefatigable investigator of marine Invertebrates, died at Ilchester, Maryland, on the 26th May. The total destruction of his magnificent collections of specimens, books, and manuscripts, by the Chicago fire proved too terrible a blow for a man of his delicate constitution.—Mr. T. C. Jerdon, the celebrated Indian ornithologist, died last month at Upper Norwood. Only about a year since he returned to Europe with the purpose of arranging the collections made during the last two years of his travels in India. The cause of his death was chronic dysentery, from which he had obtained but temporary relief.

Dr. Kuno Fischer, the eloquent writer and lecturer on philosophy, has accepted a chair at Heidelberg.

### History.

Matthaei Parisiensis Chronica Majora. Ed. H. R. Luard. Vol. I. The Creation to 1066. (Rolls Series.)

Official Correspondence of Thomas Bekynton, Secretary to King Henry VI., and Bishop of Bath and Wells. Ed. G. Williams. Two volumes. (Rolls Series.)

THE *Chronicle of Matthew Paris*, the monk of St. Albans, who wrote under Henry III., was printed by Archbishop Parker in such a way that the historian has never yet had

justice done to him. Editors at that time corrected the copy made for them from the original manuscript by a careless transcriber, so as to get something like sense out of it, but seldom referred to the manuscript for themselves. Even Henry Wharton pleads this excuse for the state of some of the passages which he has printed in the *Anglia Sacra*. Parker, however, altered even more than such an excuse would justify; and it only needs a slight comparison of the real text as given by Mr. Luard with the first edition in 1571 to discover the real state of the case.

The early part of the *Chronicle* is based on a previous compilation made at St. Albans; and the question of the real authorship is difficult. It is nearly identical with the similar *Chronicles* known under the names of Roger of Wendover and Matthew of Westminster; and yet these have been quoted, as if independent authorities, even by writers like Lappenberg and Earle, not to mention Sharon Turner. In reality, says Mr. Luard, the earlier portion of "Matthew of Westminster" is a transcript, with additions and omissions, of the MS. of Matthew Paris at Corpus Christi College, Cambridge—a transcript made at St. Albans itself, and then lent for transcription to other monasteries: the earliest of the many MSS. of Matthew of Westminster is in the Chetham Library, at Manchester; and this is the source of all the rest. In one place the Corpus MS. has "Athelmus Wintoniensis" (an error for Wiltoniensis) "co," for "comes"—the MSS. of Westminster read "cor," except the Eton MS., which has "episcopus": Parker prints "episcopus," and on the strength of this an Athelm has been inserted in the lists of the bishops of Winchester. Similarly, Roger of Wendover, in his first part, seems to copy the same compilation as the Corpus MS. of Matthew Paris. The author of this laborious compilation, used by Paris and Wendover as the basis of their histories, and the source of the popular compendium called by Matthew of Westminster's name, is unknown, having been soon thrown into the shade by the greater fame of his successors. Perhaps he was the author of the *Life of Offa* also, of which he quotes pieces; and he must have written just about the time of the struggle which led to the granting of Magna Charta. He consulted a very large number of sources, which Mr. Luard has most carefully traced out, but he has been the author of endless confusion in early dates and facts; the MS. of the *Anglo-Saxon Chronicle* which he used was the "Peterborough" one; but he did not always understand it. It shows how little we have really lost by the destruction of the monasteries, that we still possess almost every author which he did. The list of authors used by him is given by the editor; and it is especially interesting as showing what, probably, was the extent of the historical library at St. Albans, in the earlier part of the thirteenth century; we may compare it with other lists in Edwards' *History of Libraries*. Perhaps an annal of Northumbria and one of Kent lay before him, which are not now known to exist, and one or two Saints' Lives; but the Historical Commission may still find them for us. In one place, when copying Henry of Huntingdon, he interprets "secunda usus fortuna" as meaning "being victorious on a second occasion," and has actually introduced an account of a second victory, A.D. 836. He translates the Anglo-Saxon *thridan healfre* "three and a half," instead of "two and a half;" and where the *Chronicle* calls a comet "feaxede (hairy) star," the compiler says, "vexede sterre." Such was the St. Albans compilation, which Matthew Paris used as the basis of his history, making, however, certain corrections and additions. With his notes on Merlin's prophecy, we may compare the very curious commentary by John of Cornwall, in Greith's *Spicilegium Vaticanum* (Frauenfeld, 1838), pp. 99-106, which

quotes some of the original Celtic words, a fact which does not seem to be generally known. For the really valuable part of Matthew Paris, we must wait for Mr. Luard's following volumes, where his careful editing will be of material service to the cause of English history. Petrie's *Monumenta* only gave the parts of authors which were valuable as original authorities; but it is impossible to criticize or value aright the work of any mediaeval writer unless we have before us the whole history as he conceived it, and can see how he carried out his conception. The relation of the mediaeval chroniclers to each other is still a very vexed question, to which Mr. Luard has here contributed some material evidence.

We pass into a very different region when we take up Bishop Bekynton's *Correspondence*. The manuscript in the Lambeth library is a Letter-book, compiled probably under Bekynton's immediate direction, and extending over a period of more than half a century—from the reign of Richard II. to the latter part of the reign of Henry VI. The documents illustrate both the foreign relations and the domestic condition of England, and throw light on the private life and character of one of the most able and active ecclesiastics of the time—a time when the servants of the Crown were rewarded with high offices in the Church, as the approved method of paying them for their services. Sir Harris Nicolas had already translated Bekynton's journal of his embassy to Bordeaux, and prefixed a memoir of the author, to which many particulars may be added from the work before us. Unhappily his collection of political documents for England and France during Henry V.'s reign, in the Cottonian collection, was so much damaged by the fire as to be scarcely legible. A third volume, about the English claims to the crown of France, survives. Bekynton was born at the village of that name, just north of Frome, in Somersetshire, about 1390, and educated at Winchester and New College, and was therefore resident in the university during the memorable controversy with Archbishop Arundel, in 1411. He then transferred himself to the service of Duke Humphrey of Gloucester, and received several church preferments. In 1432 he was sent to France to negotiate a truce, and in 1439 accompanied Cardinal Beaufort in the embassy to Calais, his journal of which has been published by Sir H. Nicolas, in the fifth volume of *The Proceedings of the Privy Council*. He had been just previously named secretary to the king, and on his return was "appointed his reader nearly every day." A letter to Abbot Whethamstede, of St. Albans, illustrates the ingenious ways used to evade the Mortmain Act. The abbot first suffered the lands to be seized by the king's escheator, and then begged them as a donation from the crown, through his friend, Duke Humphrey. The correspondence with the Curia Romana well illustrates the "omnia Romae cum pretio," which was as true of the ecclesiastical as of the civil capital of Europe. The pope's secretary, Biondo of Forlì, sends Bekynton, as a small return, his "Decads" of History, of which Mr. Williams prints part of the fourth book, hitherto almost unknown, relating to the state of Italy in 1441; but also giving a very interesting account of a papal mission to Abyssinia, of the church in that country, and of its submission to the see of Rome—the Abyssinian part being what our editor has extracted for us. The ambassadors said that their rivers flowed "in lacum tantae magnitudinis ut mare videatur et vulgo appetetur, aut in Nilum, cujus originem apud se notissimam esse contenderunt, exonerari." Another passage says, "Simbolum Graeco more absque 'Filioque' singulis horis dicunt." In 1442 Bekynton was sent to Bordeaux to negotiate Henry's marriage with a daughter of the Count of

Armagnac; and it is the diary kept by one of Bekynton's suite which Nicolas published in 1828. It gives a vivid picture of the manners of the time, and it is important for its bearing on the history of the English domination in the Duchy of Aquitaine, as it trembled to its fall. The ambassadors rode from Windsor by Abingdon, Devizes, Wells, Glastonbury, Taunton, and Tiverton to Exeter: the diary is very business-like—"ad coenam cum J. Whaddam, vicomite comitatus Devonienensis. Post coenam magister Roos equitavit versus Powderham, et pernociavit cum domino Philippo Curteney milite." They sailed from Plymouth, and harpooned a shark during a calm. On their return they landed at Falmouth, the mission having wholly failed. The frost, which blocked up the Garonne with ice, also congealed the colours of the artist Hans, whom Henry had charged to take faithful portraits of the three young ladies; and Hans, apparently, only completed one picture. Soon after this, Bekynton was made Bishop of Bath and Wells, after having just before accompanied William Waynflete, then Provost of Eton, to Cambridge, with the first detachment of king's scholars (as our editor is careful to note). There are other very interesting notices about the universities; and we may specially notice the letter of the university of Paris against the new university which the English had set up at Caen, under Michael de Tregury, Fellow of Exeter College, Oxford, and afterwards Archbishop of Dublin. Nor are indications wanting of coming change. A letter to the general of the order of the Carmelites sets forth such irregularities and abuses in the monastic system as appeared to thoughtful minds to forebode its utter ruin and subversion. There are also constant complaints of the way in which the pope gave English benefices to foreigners neither residing nor able to reside, ignorant of the language, not knowing their people nor known of them. At the Benedictine abbey, also, of St. Séver, in Aquitaine, the prior and a few monks had procured from the pope the appointment of a boy of sixteen—otherwise canonically disqualified (being the illegitimate son of a count)—as their abbot, and had forged letters from the citizens, thanking the pope for his admirable appointment. Such flagrant abuses of irresponsible power, gradually usurped by successive popes, had always been impatiently borne by the English people; and there are indications in these volumes that a spirit of resistance was beginning to manifest itself, both in clergy and laity, which culminated a century later in the assertion of the regal, as against the papal, supremacy. One memorable example was given at this very time, in the treatment of Archbishop Chicheley by the imperious Martin V.; who further imposed an entire tenth, to be levied in England, for the Bohemian war. The popes as little understood the temperament of the national character as they did the nature of the English constitutional government. We have also some illustrations of the proceedings of the Councils of Constance and Basle. The anxiety manifested by the King of England, in common with the Emperor Sigismund and the princes of France, to prevent a collision between Eugenius IV. and the Council of Basle, and to inculcate on both sides moderation and forbearance, was, as might be expected, quite thrown away. As to the attempt at reconciliation between the Eastern and Western churches, it is evident that the mutual suspicions and jealousies of the pope and the council sorely perplexed the Greek envoys. On the whole, these volumes give a good picture of England as it was, before the outbreak of the Wars of the Roses; and we cannot but speak highly of the way in which they are edited. If there is a fault to find, it is that some of Bekynton's letters, illustrative of his embassies, already printed by the Camden Society, have not

been added, since they form an almost indispensable part of the series, and would have taken up very little room. We trust that these volumes may be followed by other series of letters and documents, which are at least as necessary as chronicles for our history. Not that all the chronicles are as yet reprinted according to the original plan. Henry of Huntingdon, and Rudborne, the Winchester historian, are as yet untouched; and there is even a Latin translation of the *Anglo-Saxon Chronicle* at Lambeth as yet unprinted. The Germans are making every effort to complete their series both of chronicles and of documents; but the publication of our series of charters, so well begun by Sir T. D. Hardy, has unhappily been long suspended. There are yet a number of the smaller *Annales Monastici*, not included in Mr. Luard's edition, which await an editor to trace out their sources and give them a good index. It seems ungracious, when so much is well done, to ask for more; we can only plead that good editions are apt to make us discontented with those that are old and defective. Mr. Williams' preface, of part of which we have given an abstract above, is especially good and readable. The similar preface to Mr. Luard's work is yet to come.

C. W. BOASE.

**The Opposition of the Estates of Bohemia to King Ferdinand I. in the Year 1547.** By Professor Karl Tiefertunk. [*Karla Tiefertunka odpor stavu českých proti Ferdinandovi I. L. 1547*]. Prague: Franz Rziwnacz.

THE Bohemian Museum has just published a most interesting and elaborate work in the Bohemian language, on a little known but very important historical epoch. It details the share of Bohemia in the first unsuccessful attempt at resistance after the time of Luther on the part of those who were not Catholics against the papal and imperial supremacy in the lands of the German empire. Had it met with greater success, the bloody history of the Thirty Years' War would in all probability never have been written.

Professor Tiefertunk has availed himself of contemporary sources of unquestionable authority, especially the manuscript *Diary of Sixtus of Ottersdorf*, then chancellor of the Old Town of Prague, who took a prominent part on the side of the estates, which is in the Bohemian Museum; and the *Acta*, compiled and printed upon the suppression of all resistance by the orders of Ferdinand himself, after careful search had collected for destruction all documents, letters, &c. that might testify against his proceedings. Good use has also been made of the archives of Bohemia, of the records in the "Landtafel," of the treasures of the Bohemian Museum, and the archives of the city of Prague.

Professor Tiefertunk commences his work by an introductory essay upon the new and important elements in Bohemian society, which had arisen since the suppression of the democratic Hussites or Taborites. These were (1) the *Jednota Bratrská*, or *Unitas fratrum Bohemorum*, from which descends the present exemplary community of the "Moravian" Church; (2) the Burgher Estate, which in intellectual and political development had risen far above the two orders of nobility, the *Pani*, or Lords, and the *Rytíři*, or Knights. He also describes the low condition into which the parliaments of the three estates had fallen, and the chicanery by which the king circumvented all efforts to maintain the liberties of the realm and the estates, at the gradual destruction of which he was steadily and consistently aiming with the characteristic unscrupulousness of a Hapsburg.

The first book contains an account of the commencement of the contest between Ferdinand and the estates in 1546, when the Protestant princes, John Frederic, Elector of

Saxony, and Philip, Landgrave of Hesse, were put into the ban of the empire by the emperor, Charles V., whose undoubted aim was the establishment of his own and the papal supremacy in the most absolute form. Reciprocal covenants of inheritance had long existed between Saxony and Bohemia, and Ferdinand induced the upper and lower orders of nobility, against the will of the burgher estate, to consent to their renewal with Maurice of Saxony, the ally of Ferdinand's brother, the emperor, to the exclusion of the Protestant elector. He then proclaimed war against the elector in execution of the ban, summoned the country to his aid and invaded Saxony; but was unable to effect much, as the militia of the estates was not bound to follow his banner beyond the frontiers.

The second book relates Ferdinand's preparations for a new campaign against Frederic of Saxony in 1547, and the commencement of opposition to his policy, which both the Utraquists and the Brethren saw to be aimed at the eventual destruction of their liberties and religion.

In the third book we find a detailed account of the resistance made by the estates to the royal policy, the citizens of Prague and afterwards the greater part of the estates entering into a "Friendly Agreement" to defend the liberties and constitution of the country, with all due respect to the person of the king. The estates also negotiated with the elector, but declined to render him any active assistance, though they raised an army themselves, elected a general, and forbade any Bohemian to cross the frontier in aid of the king against the elector, with whom they considered themselves to be at peace.

The fourth book relates various abortive negotiations, which vainly attempted to put an end to the differences between the king and the estates; and also the junction of the forces of Ferdinand with those of his brother, the emperor, at Eger, and the vacillating conduct of the estates at the crisis.

In the fifth book we find the results of the disastrous battle of Mühllberg, in which the elector was defeated and taken prisoner, and the commencement of the successful endeavours of the king to detach the greater portion of the two orders of the nobility from the burgher estate.

The sixth book relates the punishment of the estates, especially of the "royal" cities, above all, that of the Old and New Towns of Prague, the whole of whose landed property, rights of toll and dues, was confiscated, their leading men, Sixtus of Ottersdorf included, imprisoned and tortured, and the communities obliged to surrender to the king at discretion. All the other towns and such nobles as the king thought fit to summon, and who did not seek safety in flight, were compelled to deliver themselves up to him in a similar manner. Torture and cruelty were freely used, in order to obtain evidence for the suspicion of the king, that the intention of the estates had been to dethrone him and place the crown on the head of the Elector of Saxony. No such intention had existed, and no evidence was obtained. The confiscations, the details of which are given, were enormous.

The seventh book details the political, legal, and religious changes introduced by Ferdinand I. into Bohemia after the above events. It commences with an account of the "Bloody Parliament," so called from being opened by the execution of four leading men, two belonging to the lower order of nobility and two to the burgher estate. After this the parliament naturally assented to every demand of the crown, and, in fact, to the conversion of Bohemia from a limited monarchy into almost a despotism, the independence of the cities being entirely destroyed, and their authorities placed under the surveillance of royal officers, while but a

shadow of their former power was left to the estates. In the country the especial wrath of the king fell upon the *Unitas fratrum*, large numbers of whom were compelled to quit Bohemia, so that henceforth Moravia, which had not shared in the resistance of the estates to the crown, became their chief seat, and produced not only their most celebrated men, e.g. J. A. Comnenius, but also the Králitz Bible. John Augusta, who was considered the head of the *Unitas*, was taken in 1548 by an act of the basest treachery, tortured, and imprisoned for sixteen years.

The "Friendly Agreement" of the estates is printed as an appendix to the work.

It is difficult to refuse admiration to the consummate craft and consistency with which Ferdinand proceeded towards the realisation of his projects, never taking an over-hasty step, nor shrinking from making or breaking a promise, as circumstances might require. On the other hand, the indecision and weakness of the estates in general, with perhaps the exception of the citizens of Prague, is very noticeable, as compared with the vigour and steadfastness displayed by the Hussite Bohemians, when under Ziska and his successors they bade defiance to the whole power of Rome and the empire, aided by every device that religious bigotry could bring to bear.

Professor Tieftrunk has done good service both to his country and to history by this opportune and excellent work, the style of which is both clear and elegant, and which deserves to appear in a translated form in a language more accessible to the general run of historical students than the Bohemian.

A. H. WRATISLAW.

### Philology.

**Markham's Translation of Ollanta.** *Ollanta*, an ancient Ynca drama, translated from the original Quichua, by Clements R. Markham, C.B., Corresponding Member of the University of Chile. Trübner and Co., 1871.

HAVING already had occasion to review in the *Academy*\* a Spanish translation of *Ollanta*, published three years ago

by M. Barranca, of Lima, I may refer the reader to my former paper for a short sketch of the drama, and for two or three of the most interesting passages in it. Thus I shall have more space to discuss the questions relating to the origin and genuineness of the play.

As Mr. Markham justly remarks—

"The all-important question is whether the drama was handed down from the time of the Yncas, and merely committed to writing by Dr. Valdez, who divided it into scenes, and inserted the stage directions; or, whether Dr. Valdez was the actual author, and composed the work himself in a classical, and, in his day, almost archaic language."\*

In the above-mentioned review I had tried to prove

"that *Ollanta* is not a production of early times, but was written long since the completion of the conquest, by a man who did not possess any means of information beyond what we do now."

In the preface of his edition, Mr. Markham affirms that *Ollanta*

"is an ancient Ynca drama, handed down orally in order to be performed before the native chiefs, until 1780, and then committed to writing from the mouth of Indians by Dr. Valdez, the friend and sympathiser of the last of the Yncas. The old priest merely made the divisions into scenes, which suggest themselves; and introduced the stage directions in accordance with what he had himself seen when the play was acted by the Indians."†

Mr. Markham's reasons for so thinking can be summed up as follows:

1. His own collation of a copy taken from the original manuscript of Dr. Valdez gives classical Quichua in every single instance where a corrupt or Hispanised word or phrase occurs in the von Tschudi version.

"This proves that all the corrupt forms in the von Tschudi version arise from the carelessness of a copyist, and that they have no existence in the original documents."‡

2. "Moreover, the drama contains many words and grammatical forms, some of which I have indicated in the notes, that are archaic and long since disused."

3. "The only object of a Spanish priest"—for such was the condition of Dr. Valdez—"in composing such a work would be to inculcate Catholic doctrine; and not to preserve the memory of ancient pagan rites in absolute purity."§

1. Mr. Markham's copy was taken by Don Justo Pastor Justiniani, descendant of the Incas, from the original manuscript of Dr. Valdez, and given to Mr. Markham himself by Don Pablo Justiniani, Don Justo's son, and now curate of Laris. Thus, the text of the present edition is older and purer than that already published by Tschudi, and gives many corrections and additions, several of which are of considerable length. When *Ollanta*, pardoned by *Inca Kapak-Yupanki*, thanks him for his generosity, Mr. Markham adds to the three lines of Tschudi's version—

"O Inka! this is too much  
For a man who is nothing.  
Mayst thou live a thousand years!"

the following tirade:

"I am as thou makest me,  
Thou dost give me succour;  
Crippled, thou makest me stand;  
Fallen, thou raisest me up;  
Poor, thou enrichest me;  
Blind, thou givest me sight;  
Dead, thou restorest life;—  
Thou indeed teachest me to forget."||

When Inca-Sumak tries to force her way to the Inka, in Tschudi's edition she says but four lines:—

"What dost thou love most?  
Leave me to the father!  
Do not prevent me!  
Lo! there is some one dying!"

\* Markham, *Ollanta*, p. 8. † *Id.* pp. 10, 11. ‡ *Id.* p. 8. § *Id.* p. 12.  
|| *Id.* pp. 106, 107.

\* See the *Academy* for January 1870 (vol. i. p. 89).

while Mr. Markham's text runs as follows :

" Why should it be a day of joy ?  
What dost thou love most ?  
Leave me to the father,  
Let me speak to the Inca !  
Do not prevent me !  
Let me pass the door !  
Lo ! there is some one dying !  
Lo ! there is sickness, even to death ! " \*

However, the greater part of the variants are only correct readings of dubious passages, which enable us to restore almost all the corrupt lines in Tschudi's version.

In one place, at least, it seems to me that the text, as given by Mr. Markham, proves the presence of an unmistakable Spanish word in the original manuscript of Dr. Valdez. The passage to which I allude is to be found at the end of the first scene.† Ollanta, after a long conversation with the high-priest of the sun, Huillka-Umu, calls his attendant :

" Piqui-Chaqui, where art thou ?

PIQUI-CHAQUI.  
I have slept like a stone,  
And have dreamt bad dreams.

OLLANTA.  
What ? "

Now Piqui-Chaqui has dreamt of an animal tied up ; but in the three editions of the drama the names of the animal do not agree : in Tschudi's edition it is an ass (*asnuta*), in Barranca's, a llama (*llamata*), in Markham's, a fox (*atocla*). To this confession Ollanta replies :

" Certainly thou art the animal."

Piqui-Chaqui, who is the clown in the play, seeing that his lord is angry, tries to pacify him with a joke. In Tschudi's edition, which makes him dream of an ass, he identifies himself with the said donkey :

" Therefore my ears grow longer."

In Barranca's edition he becomes the llama :‡

" Wherefore my neck grows longer."

In Markham's edition he says :

" Therefore my nose scents better ;  
Therefore my ears grow longer."

Of the two lines, the first only is applicable to a fox ; the second can be understood of no animal except an ass. Had *atocla* been the true meaning of Valdez, the line—

" Therefore my ears grow longer,"

could not have been found in his manuscript ; for Valdez, in characterizing the fox, would not have given him the long ears which appertain to the donkey. Since it is found in the original manuscript, it is necessary to admit that the long-eared *asnuta* was named in the same manuscript. From this I conclude, first, that *asnuta* was the real reading, and that the first copyist of the work, Don Pablo Justiniani, or some other, meeting with a Spanish name of a Spanish animal in what he considered to be a pure Incasic drama, took it for a blunder, and substituted for it the Quichua *atocla*, a fox, with the joke corresponding to this change—

" Therefore my nose scents better ;"

or, again, that Valdez himself wrote two readings of the same passage, the one running thus :

PIQUI-CHAQUI.  
Huc *asnuta* huatascata.  
Of an ass tied up.

OLLANTA.  
Ccanpunim chaycca ccarcanqui.  
Certainly it thou art.

PIQUI-CHAQUI.

Chaycha huññancay rincipas.  
Therefore my ears grow longer.

And the other :

PIQUI-CHAQUI.

Huc *atocla* huatascata.  
Of a fox tied up.

OLLANTA.

Ccanpunim chaycca ccarcanqui.  
Certainly it thou art.

PIQUI-CHAQUI.

Chaycha chuññayan sencceaypas.  
Therefore my nose scents better.

Barranca's edition, if exact, gives a third version ; but then Barranca had not the opportunity of knowing Mr. Markham's manuscript. The two versions were probably condensed into one by the copyist.

2. In the notes, Mr. Markham indicates but two archaic forms which frequently occur in the drama ; one in the genitive-ending *c* or *cc* (*k*) in place of *p* or *pa* ; the other, the ending *chis*, *chiz*, instead of *chik*. In reference to the genitive-ending in *c*, *cc*, I must observe that some Quichua scholars consider it as more modern than the *p*, *pa* ending. Mossi, who remarks the fact, tries to explain it by saying that " the *p* of the genitive began to be pronounced like *pf*, then became *j*, which, as we have said, is written with *c* at the end of the words. This is the reason why the *p* became *c* : therefore in the common style of pronunciation they no longer write the genitive with a *p*, but with a *r* when the word ends with a vowel." \* Mossi's explanation is, I think, inadmissible ; but from what he says, we must admit that in the common style of pronunciation the genitive-ending in *c* is now used, and not obsolete. As for the form *chis*, I have heard it pronounced *chiz*, with the *z* instead of the *s*, by the wandering *collas*, who, with their medicine-bags, penetrate as far as Buenos Ayres and Montevideo. The change of *c* into *z* at the end of the words is a dialectic peculiarity which is not confined to *chis* : in some parts of the Tucuman all the words ending in *c*, *k*, are pronounced as if they ended with *z*, *s* : *chau misa rurac padre* becomes *chau misa ruraz padre*, " the priest who has said half the mass ;" *angel chac Diosta munac* is spelt *angel chaz Diosta munaz*, " he who loves God as much as an angel."

3. In my review of Barranca's *Ollanta* I tried to show that " the social state depicted in *Ollanta* is not a heathen one : it is, in fact, a sort of conventional state, the outlines of which have been drawn by a writer who picked his science out of books, and did not possess more original documents than we possess at the present day." I must confess that, even after reading Mr. Markham's paper and translation, I have not altered my opinion, and therefore beg permission to refer the reader to my former paper for the exposition and development of my argument. As to Mr. Markham's objection, " that the only object of a Spanish priest in composing such a work would have been to inculcate Catholic doctrine, and not to preserve the memory of ancient pagan times," besides being a Spanish priest, Dr. Valdez was " the friend and adherent of the last of the Yncas." He might quite well have written a political play like *Ollanta*, with the object of placing before the eyes of the Indians a view of the former grandeur of their country, and exalting the power and generosity of the Incas, as other priests have written religious ones, like *Usca-Paucar*, to propagate the Catholic faith amongst the Quichua tribes.

Thus much for the controverted question of the genuine-

\* Markham, *Ollanta*, p. 110.

† *Id.* p. 33.

‡ Barranca, *Ollanta* (Lima, 1868), p. 8.

\* Mossi, *Gramática de la Lengua general del Perú, llamada comunemente Quichua* (Sucre, 1857), pp. 7, 8.

ness of *Ollanta*. As to Mr. Markham's edition, I cannot but highly commend the accuracy he has everywhere displayed in achieving a very difficult task. "The Quichua and the English are given in parallel columns. The different readings in the von Tschudi version, of which there are many, are given in italics, and the passages in my version, which are omitted by von Tschudi and Barranca, are also indicated," being included between brackets. In fact, it is the best and certainly the most critical work which has been published on the Quichua language and literature since the days of the old Jesuit grammarians. G. MASPERO.

**The Lifade of St. Juliana.** By the Rev. O. Cockayne and E. Brock. Trübner and Co.

THE present publication of the Early English Text Society gives two texts in full on opposite pages, one from a British Museum MS. (Royal 17, A. xxvii.), the other from the Bodleian MS. 34, the former edited by Mr. Brock, the latter by Mr. Cockayne, each editor giving a translation of his text at the foot of the page. A later rhymed version from the Ashmole MS. 43 is given as an appendix; but the chief value of the book lies in the two earlier texts, which seem to be contemporary, although R. is full of omissions, and is altogether inferior to the Bodleian MS. In language and style the work bears the closest resemblance to the *Ancren Riwele*, *Hali Meidenhad*, and the lives of St. Margaret and St. Catherine, all of which Mr. Cockayne considers to have been written by Richard le Poor, bishop of Salisbury from 1217 to 1237.

As might be expected from the similarity of subject the Juliana has nearly the same vocabulary as the last named works. Still, it has several hitherto unrecorded words. An interesting example is the adjective *eðluke* (p. 71)—"me lealde hire ant leac forð, ant heo wes eðluke"—apparently an adjective formed on the analogy of the Old English *eafsynde*, &c. from *lucan* in its peculiar Middle English sense of "pull." The word is correctly rendered by Mr. Brock, "easy to lug," but Mr. Cockayne has "she was easily (led)," seemingly taking *eðluke* as an adverb equivalent to the Old English *eafelice*, which would, however, appear as *eðluke*, not *eðluke*. The translations are on the whole very accurate, but some of the renderings require criticism. "Unwurð hit is me" (p. 15) is translated by both editors, "unworthy it is of me," but it seems preferable to take *unwurð* in the well-authenticated sense of "contemptible." Mr. Cockayne's translation of "þes were . . . þat tu hauest . . . se forð þi luue ileuet" (same page), as "to whom thou hast so far thy love committed," gives *forð* a very questionable interpretation: it seems safer to take it as meaning "henceforth," of which there are numerous examples in the older poetry. Mr. Cockayne translates "unwreste unwhihtes" by "*cunning* evil ones" (p. 39), but there is no reason for departing from the usual meaning of the word, which is simply "worthless," "wicked." In the first line of p. 43, he translates "belzeebub þe balde þurs of helle" by "B. the bold *portent* of hell," although it is not easy to see why he was not satisfied with "giant," which is Mr. Brock's rendering. In "settest for his sake all þat þe i worlt is" (p. 61), the rendering "settest," of both editors, is over-literal: the verb is constantly used in the Old English poetry in the sense of "create"—one of the examples given by Grein is, "of lame ic þe leoðo gesette," where the literal translation would be quite unmeaning.

In many parts of his version Mr. Cockayne has fallen into the common error of confounding translation with mere transliteration. Thus, "þen muchele witti witege ysaie" (p. 39) appears in his version in the shape of "the great witty pro-

phet Isaiah," although "witti" means simply "wise," and conveys not the slightest idea of "wit." In the same way he translates "euch heafdes bikeoruen" (p. 67) by "carve off the head of every one"; "as beliales budel bet" (p. 59) by "as belials *beadle* bad," and "seli meiden" (p. 47) by "*seely* maiden." This style of translation not only makes the old language ridiculous, but also exercises an injurious influence on English scholarship, by deadening the modern reader's perception of the changes (often very delicate) of meaning which many old words preserved in the present English have undergone. HENRY SWEET.

**The Harrowing of Hell.** [*Neue Bearbeitung des allenglischen Schauspiels.* Von Dr. Eduard Mall.] Berlin: Th. Grimm, 1871.

ONE of the most striking characteristics of our time as compared with the past centuries is the change in the mode of studying literary monuments. Whilst an often rather narrow aesthetical horizon limited the researches of our forefathers to the classical periods of some few literatures, and whilst they either accepted as genuine the documents of these literatures transmitted to us in an often very disfigured shape or continued the process of wilful or unconscious alteration begun by the long series of their predecessors, our own generation has brought into prominence two new principles intrinsically linked together. The historical and critical methods of dealing with materials dominate at this moment in every branch of science, and have had the further effect of vastly increasing the number of the students of literature, by bringing to light not only a great number of almost unknown literatures, but also an immense quantity of highly important documents belonging to those already cultivated, and creating a totally new method for the re-establishment of the original form of literary productions. The activity of modern philologists is now mainly directed to two main questions: to the origin and successive development of the various branches of literature, and to the determination of true shape and form of the texts which have been preserved to us.

In both of these respects Mr. Mall's *brochure* on the oldest English "Mystery" is of great interest, and deserves our best thanks, though we differ from him in more than one essential point. Mr. Mall gives us a new edition of the *Harrowing of Hell*, printed twice already by Collier and J. O. Halliwell from a London MS., and once from the Auchinleck MS. by Laing and others.

The literary value of the *Harrowing of Hell* is clearly determined by the leading place it occupies amongst similar productions. It would be vain to ascribe to it great value from a purely aesthetical point of view. There is no originality of conception, the subject being taken from religious traditions, and having been treated poetically in England since the Anglo-Saxon period. We even possess a poem in this latter language in the latter part of Caedmon's paraphrase. Neither is there any artistic refinement, exquisite language, or elaborate characterization of the *dramatis personae*. The greatest merit of the poem is its entire simplicity. Dr. Mall with justice rejects the opinion of Mr. Th. Wright, who considers the *Harrowing of Hell* a mere dialogue; but he does not sufficiently appreciate the fact that the introduction to the poem preserved in one MS. (and that which Mr. Mall considers the best) calls our poem especially a *strif*. This would seem to indicate that we have to seek the origin of the drama, at least in England, in the large field of literature known by the names of "strif," "dispute," "debat," &c. For the *Harrowing of Hell* introduces Christ and Satan maintaining the justice of their respective causes, and has a distinct action as well as *dramatis personae*:

standing thus midway between the mere dialogue and the drama. If this view be correct—and it might be borne out by many English and foreign analogies—a new train would be given to the investigation of the origin of the drama which might be well worth pursuing.

Mr. Mall based his text on the two MSS. already published and a third preserved at Oxford, and supplies a complete *apparatus criticus* in the notes. The method adopted by him he has explained in an introduction at once sound and interesting. It is the first time, so far as I know, that the critical method, adopted in editing Greek, Latin, German, and Romance books, has been seriously applied to an English text. It is with no desire to depreciate the merit of the editor if I permit myself to differ from him in the way he has put his method in practice. I have already mentioned that the poem has been preserved in three MSS. Mr. Mall maintains that the Oxford copy (O) and the Auchinleck MS. (E) are derived from a common source, inferior to that from which the London copy (L) is drawn. He consequently takes L for the basis of his text, and rejects not only all readings preserved only either by O or by E, but also several readings common to both. An examination, however, of these latter has not persuaded me of their inferiority to those of L, consequently I do not accept the common origin of O and E. But further, after accurately examining the readings common to L and E, I have been convinced of the inferiority of several of them to the reading preserved by O; and this leads me to hold that L and E are copies of one common source differing from that of O; and that wherever O corresponds with either L or E, its reading is to be adopted. Without entering into a more detailed discussion, I would only add that with my view of the relation of the MSS. I regard it as a great advantage that the critical text should preserve far more faithfully the shape of the text as transmitted to us. Criticism ought to be always as conservative as possible. The reasons brought forward by Mr. Mall against the readings of O and E are, in my opinion, of no great importance, and are inapplicable to a literary production so far removed from artificial refinement. To give a single instance, vers. 139, 140. Mr. Mall adopts the reading of L:—

*I haue herd wordes stronge  
Ne dar I her no lengore stonde.*

O reads:—

*Ich haue j herd wordes harde  
Ne am ich namore satewarde.  
I herd wordes stronge  
Ne dar ihe dwellen er nout longe.*

E omits the two latter verses, and preserves only the two former, which are, on the contrary, wanting in L. Mr. Mall maintains rightly that the omission of the two latter verses are due to the scribe of E, considering the repetition of the same thought in two consecutive phrases as superfluous; but I do not see why the scribe of L may not have omitted the first two lines on similar grounds, the more so inasmuch as L offers several such omissions, as, e.g., after vers. 78, 149. The original contained, I believe, all the four lines as they are preserved by O. Prolux repetitions of this kind exist in all productions of the same period, and it is scarcely fair to apply a modern aesthetical standard to poems of the thirteenth century. However this may be, Mr. Mall's edition, offering, as it does, all the various readings of the MSS., enables every reader to select those which he may prefer. In establishing his critical text, Mr. Mall has also paid a minute attention to the linguistic aspect of the question, by making an accurate study of the rhymes. He establishes that the poem was written in the Midland part of England, that only E, the youngest of the MSS., has preserved this dialect with tolerable

accuracy, the other two offering all the characteristics of southern dialects. The difficult metrical question Mr. Mall has not touched, and though investigations into the metrical laws of a poem are always a great help for establishing the true text, it is hardly well to begin with so small a poem the almost uncultivated study of Early English metric. Subjoined to the text are some valuable critical and philological notes, and an excursus on the literary value of the poem.

EDMUND STENGEL.

*Traité de Berakthoth du Talmud de Jérusalem et du Talmud de Babylone*, traduit pour la première fois en français par Moïse Schwab. Paris: Imprimerie nationale.

M. SCHWAB, a name hitherto unknown in the field of Semitic or even of Hebrew literature, here presents us with an attempt at a French translation of the Talmuds of Berakthoth. He is certainly not without predecessors. A German translation of both Talmuds of Berakthoth was published by Dr. Rabe in 1777; another of the Babylonian Talmud of Berakthoth, with copious notes, by Dr. Pinner in 1842. Anyone who has read a few pages of these translations, or of those of Ugolini, will agree with us that the permanent value of their contents is not greater than that of the Brahmanas, and may be led to question whether it is worth while to translate the Talmud at all. In our opinion the Talmud ought rather to be excerpted on the plan of an encyclopaedia; a beginning has already been made by special works on its history, geography, zoology, medicine, &c. But if a translation be required, we must certainly stay our hands until M. Rabinowitz has finished his collation of the Munich MS., and until the Vatican MS. has been thoroughly examined. A critical edition of the Arukh, the *Kamus* of the Talmud student, and the publication of R. Tanhum's dictionary of the Mishnah, still buried in the Bodleian, are also much to be desired. With these aids a body of really critical Talmudical scholars might perhaps undertake to translate the chaotic work known under the name of Talmud. Neither M. Schwab nor his collaborators (philologists, as he says, who are too modest to give their names) have any of the requisite qualifications. It is even more astonishing that the very scanty notes which are appended contain no reference to M. Rabinowitz's *Variae Lectiones* on the Babylonian Talmud on Berakthoth, nor to Dr. Frankel's remarkable work on the history of the Talmud of Jerusalem. It is true that M. Schwab in his preface expresses regret that he had not met with the work in time. This is difficult to reconcile with the fact that the present writer's review of Dr. Frankel's book in the *Academy* (vol. i. pp. 191, 192) was rendered into French by M. Schwab in 1870.

The work under notice has already been condemned by the two leading Talmudists of France, M. J. Derenbourg, "membre de l'Institut," in the *Revue critique*, and by M. Trenel, Director of the Rabbinical School in Paris, in the *Univers israélite*; and we have not the slightest doubt that Dr. Geiger and Prof. Grätz will do the same, if they think it worth while, in their own periodicals. The verdict of these scholars is final, and the following remarks are merely added for the satisfaction of the readers of the *Academy*.

A pretentious but superficial and inaccurate preface opens the work. Its chief authorities are—not Zunz, Frankel, Munk, Krochmal, Rapoport, Luzzatto, Fürst, Geiger, Grätz, &c.—but three popular review articles. The bibliographical notes are devoid of references, and are most untrustworthy; thus the Basel edition of 1578 is mentioned (p. xlix) as the third, while it is really the sixth. Among translations, M. Schwab omits that of Rabe, which, though not famous, is certainly better than his own, and might have saved him

from numerous errors. "En dehors de la Mishnah," he says, "part minime et très-facile" (?), "on n'a traduit en latin que quelques traités fort courts de jurisprudence, et le docteur Pinner a fait une traduction allemande (qui laisse beaucoup à désirer) du premier volume de la série du Talmud de Babylone." The truth is, there is a Latin translation by Ugolini of not less than *sixteen* treatises of the Talmud of Jerusalem (*i.e.* about half the collection, putting aside the Siphre, Siphra, and the Tosiftha), including Z'ra'im, a partial translation of which is announced *avec un cœur léger* by M. Schwab. It is clear that M. Schwab has formed no just idea of the difficulty of translating the Jerusalem Talmud, extant in a single bad Leyden MS., hybrid in language, and perhaps (see *Academy*, vol. iii. p. 117) a late compilation. A commentary on part of Z'ra'im in the Jerusalem Talmud has taken Dr. Frankel twenty-four years, and is not yet finished; what a contrast to M. Schwab! Much as the latter finds fault with Dr. Pinner's work, he has taken it for the basis of his own translation, except that he entirely neglects the notes, and sometimes misunderstands Dr. Pinner's rather peculiar German. We shall therefore pass over this part of M. Schwab's work, as it is not our present object to criticize Dr. Pinner.

It would be unreasonable to expect us to have tested every word of M. Schwab's version. We have done the same as his learned French reviewers, *viz.* opened the book at random and compared the rendering with the original. We thus lighted on the end of the 6th and the end of the 7th chapter, where the Talmud, speaking of thermal springs, mentions one in a place called "between the two palm-trees" (*cf.* the names of places compounded with the word "oak"). M. Schwab translates (p. 124), "C'est une eau qui coule de source entre deux palmiers." According to the Talmudic law, a bath for the purpose of purification must contain forty Saah (measures), and the question is raised whether the forty Saah could be said to be complete, if there were liquid sand at the bottom. M. Schwab renders (p. 126), "La chaux trempée" (?), "dit-il, sert à boucher" (?) "les fentes d'une baignoire." Here Rabe renders correctly, "Wie man dünnen wässerlichen Leimen mit der Tuke zusammenrechnet, das Maass von vierzig Saah voll zu machen." On p. 452 we read, "Celui qui abandonne au ciel le jugement à prononcer sur le voisin." We should like to know what this can be except a literal rendering of Dr. Pinner's words, "Und wer da überlässt das Urtheil über seinen Nachbar dem Himmel"? Geographical words, and the names of the doctors of the Talmud, are generally misspelt, as M. Derenbourg has shown in the *Revue critique*.

The most valuable part of M. Schwab's work is, perhaps, the indices, which are unusually difficult to make for a chaotic composition like the Talmuds. AD. NEUBAUER.

#### THE MANUFACTURE OF INSCRIPTIONS AT JERUSALEM AND AL-ŞAN'Â.

##### TO THE EDITOR OF THE ACADEMY.

SIR,—With reference to Dr. Socin's letters in recent numbers of the *Academy*, allow me to make the following statement.

I saw a few weeks ago a squeeze apparently taken from an inscription of twenty-one lines, each character being, if I remember rightly, about an inch and a half in length and a quarter of an inch in depth. The material was a piece of very coarse brown paper, several feet in length and breadth. This squeeze was accompanied by a letter, giving some particulars of the discovery of the inscription, &c., and by two or three small specimens of the stone on which it was said to be engraved, a very hard red porphyry. A copy was also sent at the same time of another inscription, partly in Phœnician and partly in Nabathean characters, said to be engraved on a pillar. Both are to all appearance forgeries. The writer of the letter, which was addressed to a distin-

guished British nobleman, was—M. Shapira, of Jerusalem. I wish that M. Ganneau would communicate to the readers of the *Academy* what he may chance to know of these matters.

As to Himyaritic inscriptions, many of the tablets that now come to us from Aden are forgeries. Such may, I think, be seen, for example, in the Museum of the Royal Asiatic Society. The offender in this case is a Jewish coppersmith at al-Şan'â, to whom the well-known traveller, M. J. Halévy, very foolishly communicated some of the copies of inscriptions which he had taken. The mode of procedure, as made known to me by Baron von Maltzan, is very simple. One of Halévy's longer inscriptions is divided by transverse lines into four, and thus furnishes four bronze tablets, which are worth at Aden two or three pounds a piece. Himyaritic seals and other articles are also coming into the market there.

Let travellers and collectors therefore be very careful, and look with suspicion at every antique coming from Palestine or South Arabia.

Cambridge, July 9, 1872.

WM. WRIGHT.

##### NOTE.

Herr M. Jordan writes to correct an error which slipped into our report of the Philological Congress at Leipzig (*Academy*, vol. iii. p. 239). The author of the paper on Greek reliefs was Dr. Richard Schöne, professor at Halle, not his brother, Dr. A. Schöne, of Erlangen, to whom we had attributed it.

#### Contents of the Journals.

Götting. *gel. Anzeigen*, May 22.—Frankel on the Targum of the Prophets; rev. by Nöldeke.—June 12.—Waddington's Greek and Latin Inscriptions of Syria; rev. by Nöldeke.—Benni's Tradition of the Syriac Church of Antioch; by H. E. [A defence of the papal supremacy by the archbishop of Mosul; chiefly valuable from its fragments of old Syriac hymns.]—June 26.—Sciaparelli's *Vocabulista in arabico*; by H. E. [The vocabulary is accompanied in the MS. by a composition in Arabic, which H. E. proposes to consider as a Sura, written in imitation of the Koran, to refute the Moslem argument from the sublimity of its style.]

Centralblatt, June 8.—Grill's critical edition of Venisamhara, and Boyd's translation of Nāgānanda; rev. by A. W.—June 15.—*The Indian Antiquary*, Nos. 1-3; and Notices and Catalogues of Sanskrit Manuscripts; rev. by A. W.

Monatsschrift für Gesch. u. Wiss. des Judenthums, June. (Philological.)—Miscellaneous notes on the Rabbinical language and antiquities; by J. Perles.—Karaite bibliography; by P. F. Frankl.—The double pronunciation of the Hebrew Resh; by Dr. Grätz. [Extracts from a MS. of the Bible at Cairo, and from Saadia's commentary on Sefer Jezira, from which it appears that the soft sound of R in conjunction with Z, S, D, T, TH, was not considered euphonious. Grätz suggests that Resh and Zain may have been related in sound; *cp.* the characters for them in Arabic. The Slavonic Z is pronounced like *rsh*. If R were so pronounced in certain cases in Hebrew, it could not well be combined with Z.]

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 53.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The Editor cannot reply to questions from authors respecting the notice of their books.*

*The next number will be published on Thursday, August 15, and Advertisements should be sent in by August 12.*

## General Literature.

**The Pretenders ; a Norwegian Drama.** [*Kongs-Emnerne*; historisk Skuespil. Af Henrik Ibsen. Tredje, gjennemsette Udgave.] Copenhagen.

THIS saga-drama comes to us almost as a new work, for the original edition, published at Christiania in 1864, won for itself little beside local reputation, and has long been out of print. Since that year, however, the fame of its Norwegian author has most rapidly increased; two separate translations of this very poem have appeared in Germany, and a revised and almost rewritten edition of the original is sent forth by the leading publisher of Copenhagen. Ibsen has been very slow in gaining maturity; almost a contemporary of the well-known B. Bjørnsen, the latter writer, though younger, far outstripped him in precocity; but while some of Bjørnsen's earliest works are the best he has produced, Ibsen has steadily risen in power and scope, till his last dramas exceed in ability anything that his rival has done or is likely to do. The literary life of Ibsen divides itself into two very distinct periods; the earlier of these may be termed the historic, and the dramas that developed themselves in it were all founded upon incidents in the chronicles of mediaeval Norway; of these the one under review was the last, and unquestionably the best. The later period may be styled the polemical or satirical, and the poems which belong to it are all lyrical dramas attacking various follies in the Scandinavian society of to-day. The first of these was *Kjærlighedens-Komedie*, "Love's Comedy," published in 1863. The two periods accordingly overlap one another.

*Kongs-Emnerne*, "The Pretenders," or, to be literal, the "materials out of which to make a king," has for its theme the struggle for the vacant throne of Sverre, in the first half of the thirteenth century. This epoch, the most romantic in saga-history, has been a favourite with the northern poets, from Öhlenschläger down to Bjørnsen. In this case, the time is chosen which immediately followed the death of King Sverre. A troop of claimants clutched at the falling crown, but two stood out above the rest, and drew the eyes of all men upon them, Hakon Hakenssön and Skule Bårdssön. Between these the choice really lay; Hakon was putative son of Sverre, and Skule brother of an earlier king. Ibsen's drama begins with a scene in which all the heads of the nation, gathered before Bergen Cathedral, wait for the ordeal of hot iron to decide whether Hakon is truly Sverre's son or no. The ordeal declares in the affirmative, and Hakon, so assured by heaven, gains perfect confidence in himself, and in the justice of his cause, while Skule doubts and hesitates. Thus the keynote of the poet's estimate of each character is struck at once: Hakon's strength is his

calm self-sufficiency, as Skule's weakness is his vacillating self-mistrust. Hakon becomes king, does everything to conciliate Skule, makes him duke, marries his daughter, but to no avail. In Skule there is ever the same fiery craving for equality with Hakon, for the name and right of king. But, while Hakon possesses to an eminent degree the good fortune and august bearing of an old-world king, Skule, as his rival says, "has all superb gifts of intellect and courage, is made to stand nearest to the king, but never to be king himself." Hakon's great new idea is to make Norway not a kingdom only, but a nation, to break down provincial feuds, and make the people one and indivisible. How Skule plagiarises this idea, finds it gives him a power over men's hearts that no thought of his own ever gave him, how by its help he rises to brief kingship through much blood, and falls at last before the innate power of will that makes Hakon king by every right human and divine, can only be roughly indicated here. The main characters are drawn with great subtlety and finish, and are relieved by the delicate portrait of Queen Margaret, wife and daughter of the rivals, and by that of Bishop Nicolas, a crafty and witty priest, utterly selfish and unprincipled, but devoted to the interests of his church. The dramatic power displayed in this poem quite raises it out of any mere local interest, and gives it a claim to be judged at a European tribunal.

The original publication of *Kongs-Emnerne* was hampered by the coeval appearance of a play, *Hertog Skule*, on the identical subject, by the popular poet, A. Munch. It was as when Mr. Morris' *Defence of Guenevere* immediately preceded the *Idylls of the King*. At first, Munch's piece was naturally received with higher applause than Ibsen's, but time has already worked its revenges for the younger writer. Munch's drama is graceful and correct, but possesses nothing of the piercing insight into human passion that *Kongs-Emnerne* displays. The latter work is not written in verse, but in very simple, stately prose. One wonders that a poet with such a gift for flexible versification as Ibsen has proved himself to have should have been contented with prose; still, prose is far better than the pompous metre in ancient Pistol's vein that clothes most modern tragedies. Here and there a little lyric, like a jewel, breaks the dialogue. I miss, with regret, one that used to adorn the last act, when the women rejoice over Skule, as he goes to his death, roused into heroism at last.

The spelling of this edition is quite new and curious. It has evidently been the result of an interesting experiment, an attempt to break down the slight but exasperating barrier between the Dano-Norwegian and the Swedish languages. In this book Ibsen, writing Danish, spells it as much as possible like Swedish; the capital letters, commencing nouns, are dropped; all mute vowels are thrown out. For instance, the Danish *giøre* is spelt *göre*, that it may approximate the Swedish *göra*. If the languages could be induced to meet one another halfway after this fashion, it would wonderfully simplify the study of Scandinavian literature. At present the two languages repel a student with a double difficulty; and, as if this was not enough, a fanatical clique of Norwegian writers is trying to found a third tongue there.

EDMUND W. GOSSE.

Poems of Albert Möser. [*Nacht und Sterne*. ("Night and Stars.") Neue Gedichte von Albert Möser.] Halle: Barthel.

THERE are two of the later German poets—R. Hamerling and A. Möser—who attract in an especial degree the attention of their countrymen, and it is to the most recent work of the latter that we wish to call the attention of the English public. The first collection of Möser's poems appeared in

1865, and a second edition, enlarged, in 1869, both of which were warmly received by those qualified to appreciate the largeness of the poet's views, his fervid enthusiasm for all beauty, and his wonderful mastery of form. His *Neue Gedichte* possess these qualities in a still more eminent degree; they show us the poet's inmost nature; we clearly perceive the soil where his poetry grew, the elements whence it derived its nourishment. Möser draws his inspiration from classical literature; his poetry is saturated with the spirit of antiquity. The hymns especially remind us of the choruses in the ancient tragic poets; in the absence of rhyme the idea develops itself more freely, and the rhythm rises and falls in harmony, so as to give its full and just expression to the thought, which, with Möser, is generally predominant over feeling, and chiefly occupied with philosophical contemplation of the universe. Borne on "melancholy wings of thought," he struggles

"To solve the enigma  
Of the sphinx of the worlds,  
To fathom the primaeval  
Eternal mystery of life."

The poet is a disciple of Schopenhauer—like Hamerling, the author of *Der König von Sion, Ahasverus in Rom*, &c.—and his prevailing mood is one of melancholy reflection on the nothingness, the fleetingness of existence—"since nothing is constant but change"—the painful fragmentariness of human life and action, the misery of existence, and the sufferings of mankind. But all these different elements are outweighed by a passionate admiration for all that is beautiful, whether a living woman, or an antique marble goddess; for he never craves to possess what he admires so fervidly; his longing for the ideal is disinterested, for he has felt that the object of our struggles loses its charm as soon as it is won, and that the absolute beauty after which the poet aspires is to be found nowhere but in his own bosom.

Poetry, the power of expressing the love which burns within him for all that is noble and good, and the objects which kindle these sentiments, these are the poet's stars in the gloomy night of existence. The songs and hymns sometimes remind us of Heine by the gracefulness of their form. A canzone, "Sacrifice offered for the Dead," noble in form and substance, is dedicated to a fallen friend and pupil, as well as a short cycle of deeply felt poems, where, however, one line of the burden, "Poor lad, poor lad!" is poor, and weakens the general effect. A succession of graceful-sounding *Ghaselen* is nevertheless not wholly satisfactory: the deep earnestness of the poet's mind does not harmonize with the playful verse; the thought is too weighty for its vehicle, and the consequence is an apparent artificialness in the whole. The true character of the *Ghasel*, which, by a continually recurring repetition of rhymes and images, aims at exciting one lasting sensation with scarcely perceptible variations, is missed. Sonnets of perfect finish, and spirited distichs, of which a few are graceful imitations of the antique, conclude this volume, which in euphony and harmony far surpasses everything that later German poets have produced, and is only exceeded by Goethe and Heine, who touch by a simplicity so nearly akin to nature that they make us forget how much of it is due to art. M. BENFEY.

*Erewhon; or, Over the Range.* Trübner and Co.

SINCE the time of Gulliver the description of fictitious societies has been a favourite medium for satire on the existing, and the rapidity of progress in both inventions and ideas has made such works especially popular of late. To make such a *jeu d'esprit* effective, a writer must have not only satirical power, but also a vivid and accurate imagination.

In *The Coming Race* the fiction was ingenious, picturesque, and well sustained, but the satire was slight: in *Erewhon* the invention is slight, and wants those touches of definite imagination which give reality. The introductory chapters, indeed, which describe the hero's adventurous journey over the range which separates Erewhon from the known world are very well written: within the realm of reality the author's imagination does not fail him; but no sooner has the hero reached the wonderful region in which our interest has been aroused than all is either familiar or indefinite. Erewhon (Nowhere) and its people are very like England and the English; we are told that everything differs a little from its European counterpart, but the features of that difference are not presented to the imagination. In Erewhon many habits and opinions are the reverse of ours, like the name of the place, but that is all; nor is this principle carried out thoroughly. In short, the fiction is so slight that, instead of stimulating interest, it overlays the satire with an irritating vagueness. The Erewhonians worship the goddess Ydgrun, who differs in no way, except in the arrangement of the letters, from Mrs. Grundy: indeed, by an amusing slip, the name is once printed Grundy. They profess an attachment, which they do not feel, to certain institutions, of which no definite conception is presented to the reader, called "musical banks;" these are, in plain English, churches, and their "cashiers" are ministers of religion. The Erewhonians subject their children to what is called the "birth-formula:" under this *alias* the usual arguments against infant baptism are adduced. They worship personifications of justice, strength, &c.: by this device the belief in the personality of God is somewhat feebly satirised. A passage about the "cashiers of the musical banks" will show how slight is the imaginative element:

"In fact it was a career from which retreat was virtually impossible, and into which young men were generally induced to enter before they could be reasonably expected, considering their training, to have formed any opinions of their own. Few, indeed, were those who had the courage to insist on seeing both sides of the question before they committed themselves to either. One would have thought that this was an elementary principle—one of the first things that an honourable man would teach his boy to do, but in practice it was not so. I even saw cases in which parents bought the right of presenting to the office of cashier at one of these banks, with the fixed determination that some one of their sons (perhaps a mere child) should fill it."

One can see no reason why these things should not have been said of English parsons instead of Erewhonian bankers, except that it would then be seen how commonplace they are.

The most interesting part of the book is that which advocates (apparently) the theory that what we call moral vice is but the result of nature and circumstances, and therefore ought not to be subject to moral reprehension. The Erewhonians pity moral vice, but punish physical. The swindler is handed over to the doctor, and his friends enquire after his progress with tenderest solicitude, but the culprit who is convicted of consumption is scouted by his friends, and imprisoned with hard labour for the rest of his life. Yet these people recognise the same moral distinctions as we do: for they perceive an advantage in honesty, and condole with the dishonest; and what advantage has honesty over dishonesty except the moral one? The author has attempted to describe what cannot be conceived—persons who recognise the distinction of right and wrong, and also that of praise and blame, yet do not praise the right, or blame the wrong. To make his fiction conceivable, either the Erewhonians must have no moral ideas, but regard all vice, physical and moral, as disease—awarding neither praise nor blame to either—or they must bring all vice into the moral categories, and punish both for illness and for sin. The

former is probably the author's real meaning, that all vice is disease, and that, accordingly, we ought to have no moral ideas. How does he propose to get rid of them? On the whole this is not a very powerful statement of the medicinal theory of punishment.

There is a chapter on universities, and an ingenious speculation on the possibility of machines developing into rational beings; here and there we meet with a poor joke, or a bit of doubtful Latin, but it is a dull book throughout.

R. S. COPLESTON.

### LITERARY NOTES.

*La Crónica de los Cervantistas*, of which four numbers and a supplement have been issued, is the fruit and the sign of that remarkable revival of interest in Cervantes and his works which is just now so active in Spain. According to the prospectus of the editor, Don Ramon Leon Mainez, it is intended to be a faithful echo of all the admirers of *El Príncipe de los Ingenios*, a medium for the interchange of opinions and ideas relating to his life and works, and a storehouse of criticism and illustration on all points connected with Cervantic literature. The publication fairly fulfils this promise, although we cannot help wishing that a better proportion had been kept between the critical faculty and the patriotic spirit, between the facts and the raptures. The first number, dated appropriately the 7th of October, the anniversary of the battle of Lepanto, contains, in addition to glorifications of him who to all Spaniards is the hero of that day, an article by Don José Maria Asensio, one of the most eminent of Cervantistas, refuting the notion of the biographers, that the allusion to "Filena" in the *Viage al Parnaso* is to an early poem now lost. Señor Asensio shows that "Filena" is a misprint for "Silena," a name which occurs in the *Galatea*, and is a reference not to a poem but to a mistress—the object of Cervantes' Portuguese amour, and the mother of his daughter Isabel. Señor Mainez himself contributes an article devoted to the superfluous demonstration against one Sbarbi, a priest, that Cervantes was no theologian. The second number contains, besides Sbarbi's answer, a record of all the honours intended to be paid to Cervantes on the anniversary of his death in the various towns of Spain, and a useful bibliography of minor works relating to the author of *Don Quixote*, by Don Cayetano Alberto de Barrera. There is a monograph, by the geographer Fermin de Caballero, on the country of Don Quixote, proving that his place of birth was Argamasilla de Alba, and not any other of the numerous towns which have contended for the honour. Don Manuel Cervantes Peredo pronounces on the "hidden meaning" of his namesake, that there is no hidden meaning—that in *Quixote* "all is exoteric and nothing esoteric." The third number continues the account of the anniversary celebrations and Barrera's bibliographical notes, and introduces an English Cervantist, Mr. A. J. Duffield, who asks for help from Spanish scholars in overcoming some difficulties in the text of *Don Quixote*, with a view to a new English translation. The religious and literary functions which were performed on the 23rd of April in honour of Cervantes form the especial subject of a black-bordered supplement. In the fourth and last number is a tribute, by the editor, to the memory of Fray Juan Gil, the Redemptorist, to whose courage and devotion Cervantes was mainly indebted for his release from captivity in Algiers. Don Leopoldo Ruis writes, with needless severity, of a foolish continuation of *Don Quixote*; and Don Francisco Lopez Fabra enumerates the editions of the immortal work which have appeared in all languages, reckoning 87 in Spain and 191 in other countries; to which Don Manuel Cerda adds an elaborate collation of the first editions of the *Galatea* and the *Quixote* in Spanish.

The *Allgemeine Zeitung* (July 10) communicates to its readers some passages from the autobiography of Grillparzer, which will form the tenth volume of his collected works. It promises to be of much interest, for, though not a friendly, Grillparzer was a very intelligent critic of the many fashions in literature which he lived to see begin and end: as a case in point we may cite his remarks on the tendency of artificial unanimity to lead to over-

frequent changes of popular taste. His account of the treatment of *König Ottokar* by the censorship is curious; his pilgrimage to Weimar, on the other hand, was not very different in result from others we have read of. His estimate of his own merits is very simple: "the best of those who have come after Goethe and Schiller," but he himself did not mean this as high praise.

The *Deutsche Reichszeitung* has brought down on itself the wrath of all admirers of Goethe by some rash and quite unproved assertions and insinuations to the discredit of Frederika Brion, which profess to rest on continuous Sesenheim tradition. Goethe's defenders declare that so far as any tradition reflects upon Frederika, it is one which connects her name with that of the Roman Catholic curate of Sesenheim, some time after Goethe's departure from Alsace. But what is far more certain than either scandal, and fatal to both, is that Frederika and her love affair were completely forgotten in Sesenheim when the third volume of *Wahrheit und Dichtung* appeared, and made her home a place of pilgrimage, where of course the faithful were regaled with traditions according to their tastes.

M. Th. Bentzon begins a series of sketches of American humorists with an account of Mark Twain in the *Revue des deux Mondes* (July 15). His criticisms are quite unexceptionable, but he seems to have been misled by the advertisements of a certain type of publisher, so that he exaggerates the popularity of his author, while expressing surprise at its extent.

### Art and Archaeology.

#### NEW FRAGMENTS OF THE FRIEZE OF THE PARTHENON.

IT is now about twenty years since, in a letter printed in vol. v. N. S. of the *Transactions of the Royal Society*, I drew attention to the fact that, scattered about in various places on the Acropolis at Athens, were small fragments of the frieze of the Parthenon. In the valuable work on that temple recently published by Professor Michaelis (see *Academy*, vol. ii. pp. 412-414), he has very happily adjusted several of these fragments to their places on the frieze. There are, however, on the Acropolis, a number of other fragments of the frieze which Professor Michaelis never saw, and which have been lying about the Acropolis for many years so intermixed with fragments of other sculptures that it has been no easy matter to pick them out. This has been recently done by Signor Martinelli, a Swiss formatore resident at Athens, by whom casts of these fragments have been made for the British Museum. On confronting these casts with the slabs of frieze in the Elgin Room, I have succeeded in adjusting to their original places the fragments noted in the subjoined list, the references in which are to the plates of Michaelis.

(1) The most important of these fragments is one which connects the horses, xxi., with the charioteer and his *apobates*, xxii. in plate 12, whereon is represented the part of the procession on the north side of the temple nearest the east end. The new fragment is evidently the one which I saw on the Acropolis in 1852, and which I describe in my letter already referred to as "A fragment of the frieze consisting of the tails of two horses, and the front rail, *ἄρμα*, of a chariot." The right hand of the *apobates*, xxii. 65, rests on the rail. It will be seen by reference to Michaelis that the right-hand corner of the same slab was broken away when Stuart drew it. One of the new casts, however, supplies this missing corner, on which are, of course, the remaining forelegs of the four horses. It is interesting to observe that this composition of two chariots, xxi.-xxiii., has only been recovered since the publication of the work of Michaelis. The two fragments which form the upper part of xxii. long remained in the Museum as isolated fragments, and are published as such in the *Museum Marbles*, viii., frontispiece.

(2) In plate 12, x., a new fragment supplies the feet of figure 38, and some of the drapery of No. 37, which is divided in half here by the joint.

(3) In the eastern frieze, plate 14, viii., the head of fig. 61 and the faces of 58, 59.

- (4) *Ibid.* vii. 49, right foot of male figure at corner of slab.  
 (5) *Ibid.* iii. 19, feet of male figure.  
 (6) In the south frieze, plate 11, the remainder of the chariot-wheel, part of which is shown in xxix. 71.  
 (7) *Ibid.*, remainder of the chariot-wheel shown in xxv. 61.  
 (8) *Ibid.* plate 10, xvii., forefeet of horse 45, and part of hind-quarter of next horse.  
 (9) *Ibid.* xix., upper left corner of slab showing horse's mane.  
 (10) Western frieze, plate 9, xiv. 26, the right-leg of the figure on the left. This leg was missing when Carrey drew this slab.

In plate 12, iii., Michaelis gives a fragment of the forelegs of the cow, and the legs of fig. 7, with which he combines the legs of fig. 8. A fragment of a cow's hindquarter broken in two pieces probably belongs to this group, and I am disposed to add the hindlegs given by Michaelis, plate 13, xxvii. D, though no actual adjustment of these two fragments one to another can be made from the casts. If the fragment with the hindquarter is rightly attributed, the length of the next slab, iv., may be approximately fixed, for immediately behind the hindquarter the marble is cut for a joint.

Of the fragments I have here enumerated, several might have been long since re-united to the slabs still remaining on the Acropolis to which they belong, if the sculptures now lying about there had been collected into one place, and examined by some one experienced in putting together ancient sculpture. The composition of the frieze of the Parthenon is so precious that no amount of labour or expense should be grudged which can tend to the recovery of the missing groups.

Considering the length of time during which the pieces recently united to the frieze have remained unexamined at Athens, we cannot feel sure that every extant fragment of it is known. It is matter of notoriety that at the time of Lord Elgin's visit, travellers were in the habit of carrying off such portable fragments of the frieze as they could obtain, and there is clear evidence that more than one slab was barbarously mutilated for this purpose. Among the morsels so carried off were (1) the fragment which so long lay unknown at Marbury Hall, where it was discovered by Mr. George Scharf in a box under the staircase, and generously presented to the Museum by its owner, Mr. Smith Barry; (2) the fragment so long preserved in the Villa Cataio, and now in the possession of the ex-grand duke of Modena; (3) the head purchased by the British Museum at the Pourtales sale; and (4) the head at Karlsruhe (Michaelis, plate 13, xxvii. B). Who shall say how many more such precious relics still sleep in the oblivious dust of private collections? C. T. NEWTON.

### ART NOTES.

M. François Forster, one of the most distinguished engravers of the French school, died recently at Paris, at the advanced age of eighty-two. M. Forster was the intimate friend and compatriot of Léopold Robert, and many interesting details concerning him and his earlier life will be found in the "Correspondance inédite de Léopold Robert" which M. Charles Clément is at this moment bringing out in the *Gazette des Beaux-Arts*. Amongst his principal works may be cited the "Vierge au bas relief," after Leonardo da Vinci; "Sainte Cécile," after Paul Delaroche; "Énée et Didon," "Aurore et Céphale," after Gros; and the "Trois Grâces," "Vierge à la légende" and others, after Raphael, his favourite painter.

M. le Baron Cloquet has recently presented to the Louvre collection one of the finest pieces of Palissy ware in existence. It is a very large oval dish. The border is composed of foliage; in the centre lies a lobster holding in its claws a dying fish. The state of its preservation and the perfection of its enamel leave, it is said, nothing to be desired by the most fastidious amateur.

The statue of Ronsard was inaugurated at Vendôme on the 23rd of June. It is the work of M. Irvoy, professor of sculpture at the art-school of Grenoble.

We learn from the *Chronique des Arts* that the administration of the Louvre have recently acquired a very good picture by

Poterlet, an almost unknown painter who died at Paris in 1835, at the early age of thirty-two. The subject of the picture is the dispute between Trissotin and Vadius in the *Femmes savantes*.

A very fine collection of English medals has been recently purchased by MM. Rollin and Feuardent, the well-known Parisian antiquaries.

A memorial to Winckelmann has been erected in the hall of the staircase of the Japanese Palace at Dresden. The memorial consists of a bronze portrait medallion in relief, by Brossmann; the marble tablet which forms the background was executed from a design by Richard Steche. The memorial was solemnly uncovered in commemoration of the hundredth anniversary of Winckelmann's death, which occurred June 8, 1768.

The art-school for women at Munich has just been voted a yearly subvention of 6000 florins by the Bavarian government.

Wilhelm v. Kaulbach is at work on a new composition, "Die Verfolgung der Christen unter Nero," which is said to be of a very high order of merit. At Munich the restoration of the frescoes by Professor Rottmann under the Hofgarten arcades is going on but slowly, and seems likely to be a work of some years. Professor Zumbusch has now completed the last and principal figure for the national memorial to King Maximilian II. The work has been largely visited in the professor's atelier, and has excited great admiration.

The *Zeitschrift für bildende Kunst* for July contains a very spirited etching by W. Unger, after a Poussin in the Cassel Gallery. The subject is "Satyrs and a Bacchante"; the composition is full of animation and swing, but we miss the refinement of charm usually characteristic of Poussin.—Carl Justi contributes in the same number an article on "Philip von Stosch und seine Zeit," which will be found worth reading by all who take an interest in the movement of antiquarian research going on in Italy during the first half of the last century.—Phil. Sylvanus concludes his notice of the designs for the parliamentary houses of Berlin.—"R." calls attention to the wholesale destruction of old Nuremberg which is now going on: he says that now that the official rage for pulling down has once begun its brutal work in the outer part of the town, it is fast pressing towards the centre—the White and the Lauferschlag towers are to be the next sacrifice.

"Denn alles, was entsteht,  
Ist werth, dass es zu Grunde geht.

H. Ludwig contributes an essay on the possible use of petroleum in oil-painting.

The Print Room at Dresden has just received an exceedingly important and valuable gift. Geheimrath Dr. Müller, who is well known as a zealous amateur, has presented 178 drawings by modern masters, the best and most valuable of his magnificent collection of modern drawings. With the exception of some drawings by D. Chodowiecki (the engraver of "Les Adieux de Calas," 1768; but perhaps best known by his twelve illustrations of Clarissa Harlowe), all these drawings represent the school which begins with Carstens. From his hand there is a drawing of the "Four Seasons." There are also examples of Thorwaldsen, Reinhardt, Koch, Cornelius, Overbeck, Veit, Führich, Steinle, Delaroche, Léopold Robert, Calame, Callow, Copley, and others.

The American painter and poet Thomas Buchanan Read died at New York on the 11th May last. Mr. Read is best known by his paintings of "The Lost Pleiad," "Undine," "The Star of Bethlehem," and his portraits of Longfellow's children, of General Sheridan, and Mr. Peabody. A complete collection of his poems appeared in 1860.

The Institute of Painters in Watercolours has just been deprived by death of a valuable member, Mr. Henry Tidey, elected in 1858. He early distinguished himself as a portrait-painter, but has of late devoted himself entirely to poetic subjects. His "Feast of Roses" was purchased by the Queen, and "Dar-

thula," by the Duke of Manchester. He took a lively interest in all theoretical questions connected with his art, and was recently nominated vice-president of the Society for the Encouragement of the Fine Arts.

The *Times* of Monday, July 22, under the heading, "Temple of Diana at Ephesus," contains a summary of the report made to the Dilettanti Society by a committee chosen out of its own members, on the results of the recent excavations at Ephesus. Mr. Wood obtained the first clue in exploring the great theatre at Ephesus by the discovery of an inscription laying down the route by which, on the birthday of the goddess, her treasures were to be carried in procession from the temple to the great theatre, and back to the temple through another city gate called the Magnesian. Mr. Wood soon discovered one of the two gates. From it issued an ancient road flanked by sepulchral monuments of the Roman period. The line of this way pointed to a north-east direction, and outside another gate near the Stadium a second road was discovered, converging towards the one already partially traced. Following these converging tracks in April, 1869, Mr. Wood struck upon the wall enclosing the *peribolos* of the temple, at an angle in the masonry of which was inserted in duplicate an inscription in Greek and Latin, stating that the emperor Augustus, out of the revenues of the goddess, had rebuilt the *peribolos* wall round her temple. After tracing the two lines of wall a short distance, all sign of them was lost, and the temple had to be sought by sinking pits within the presumed area of the *peribolos*. Here the alluvial soil ran deep, averaging 22 feet above the ancient surface. At length, in April 1870, Mr. Wood came upon a pavement of white marble, on which were lying fragments of ancient sculpture. These remains were found 18 feet below the surface; immediately above the pavement was a stratum of splinters of white marble, partially calcined by fire. As the area of excavation was enlarged on this spot, remains of Ionic architecture cropped up everywhere. In February, 1871, part of the lowest drum of a column 6 feet 1 inch in diameter was found in its original position. To this succeeded, in the autumn of 1871, the discovery of another drum nearly entire, on which was sculptured a group of male and female figures. Fragments of two more sculptured drums, a pilaster with a fine group in high relief, capitals, bases, and drums of columns, were lying in heaps at the bottom of the excavation at the close of the year 1871. The *Caledonia* was promptly despatched by the Admiralty, and took on board upwards of sixty tons of marbles in January last. Since the beginning of the year Mr. Wood has made ready for carrying on further works in the autumn. The question now is, how far is the nation disposed to aid him in this gigantic undertaking? Is this enterprise so important, and hitherto so vigorously conducted, to be left to languish for lack of sufficient funds at the very moment when its prospects are most brilliant?

The paintings executed by Hans Makart for the dining-room of Herr Nicolas Dumba (see *Academy*, vol. iii. p. 26) will not, we hear, fill the situation for which they were intended, but are still in the market.

The Roman burying-place discovered at Ratisbon in the course of excavations for a railroad continues to yield a variety of curious and interesting objects. A large glass urn containing a gold filigree ring with pearl attached has been found, and, what gives rise to more speculation, a separate burying-place for horses, or some other animal, whose bones are found upon a thick layer of egg-shells; an urn on the same spot contained two eggs in an almost perfect state of preservation.

The first volume of Dr. Hermann Grimm's *Life of Raphael* is now ready for the press, and will shortly appear in print.

A correspondent writes to us from Cassel, where the yearly meeting of the General Society of German Musicians took place a short time ago. The chief aim of this society and of the concerts connected with its meetings is to introduce the works of young composers to the public, and the programmes of its performances consist chiefly of the representative work of the rising generation. This fact explains the general tendency towards the "future," the more so as the society counts amongst

its members one of the leaders of the progressive movement, Franz Liszt. The oratorio of *St. Elizabeth*, by this composer, was the most important work of this year's concerts, and the presence of the master himself made the whole appear almost in the light of a Liszt festival. Still we notice also the names of the chief representatives of other schools, e.g. Brahms and Rubinstein, in the programme. Amongst the new orchestral works of importance our correspondent mentions particularly an overture by Severin Svendsen, a young composer of Norwegian birth, but educated at the Leipzig conservatoire, and imbued with the spirit of the best German masters. He is well known to the musical public in Germany by a symphony and numerous compositions of chamber music. The present work is a symphonic introduction to Björnster-Björnson's tragedy of *Sigurd Slembe*, and the character of that hero is said to be rendered by the composer with unusual dramatic power and melodious beauty. The work was received by the public with great enthusiasm.

### Theology.

#### THE POSITION OF THE SYNOPTIC QUESTION.

The Gospel of St. Mark and its Synoptic Parallels. [*Das Markusevangelium und seine synoptischen Parallelen*, erklärt von Dr. Bernh. Weiss.] Berlin: Hertz.

It is almost ten years since the present reviewer published a work on the synoptic gospels, in which the theory was maintained at some length that their common root is to be found in "the gospel according to Mark." The current of critical opinion continues to flow in that direction, though it is fair to mention that some eminent theologians represent an opposite tendency in favour of Matthew. Mark, either in its present or in an earlier form, is generally accepted as the foundation, and a collection of sayings and discourses of the Messiah ascribed to Matthew as an important source, of the synoptic literature. This view was at once adopted by writers of such various theological positions as Weizsäcker, Schenkel, and Wieseler on the Protestant and Sepp on the Roman Catholic side. Since 1863 (Ewald, Meyer, Bunsen, Volkmar, Ritschl fall earlier) the priority of Mark has been accepted by Renan, Hausrath, Uhlhorn, Ueberweg, not to mention less known writers. Wittichen's essay, "On the Historical Character of the Synoptic Gospels" (*Jahrbücher für deutsche Theologie*, 1866, p. 427, foll.), may also be added, inasmuch as it distinguishes the now existing from the original Mark only by the absence of that Jewish colouring which made the gospel unsuitable for Gentile readers. The substantial agreement of Wittichen with the present writer is still more evident from his supposition of a second record, in order to account for the common element in Matthew and Luke.

Another class of critics maintain the priority but not the originality of Matthew, e. g. in England Sir R. Hanson in *The Jesus of History*, who maintains that this gospel has passed through various stages, from the collection of *λόγια* to the present text. In Germany we must first of all refer to Hilgenfeld, who has not only returned to the defence of his old anti-Baur position in an essay entitled "Mark between Matthew and Luke" (*Zeitsch. f. wissenschaft. Theologie*, 1866, p. 82, foll.), but in some later researches (*ibid.* 1867, p. 303, foll.; 366, foll.; 1868, p. 22, foll.) has described Matthew as a "tertiary" formation, the lowest stratum of which is demonstrably that Aramaic "gospel according to the Hebrews" the fragments of which he about the same time collected (*Novum Testamentum extra canonem receptum*, 1866, p. 14, foll.). This last opinion, however, so often maintained from Semler to Baur, is rejected by all other critics, Sepp excepted. The "gospel according to the Hebrews" is probably only an Aramaic edition of the Greek Matthew, accommodated to the wants of the Jewish Christian sect.

We pass to Holland. In 1863 Lamprechts showed convincingly that Luke was dependent on Mark. Meijboom (*Geschiedenis en Critiek der Marcus-Hypothese*, 1866) and Michelsen (*Het Evangelie van Marcus*, 1867) maintained the originality of Matthew and Mark respectively, the latter, however, carefully distinguishing between a Protomarcus (who alone lived before the fall of Jerusalem) and a Deutromarcus. Scholten, the real head of the Dutch school, adopted this distinction in *De oudste Evangelie*, 1868, where he made a sketch of the life of Christ by John Mark and the collection of *λόγια* by Matthew the lowest strata of the evangelic literature. From the *λόγια* and an enlarged edition of Mark proceeded the existing Matthew, which, however, as in the case of Mark, we only possess in a final church-redaction, so that Scholten, like Hilgenfeld, can speak of a Tritomathæus. The controversy does not seem to have worked itself out in Holland any more than in Germany; at least, A. D. Lomans and Hoekstra, in the *Theologisch Tijdschrift*, occupy only middle positions.

"Via Media" has in fact become the watchword of recent synoptic criticism. A whole series of works, the most mature of which is the commentary at the head of this article, are devoted to the object of distributing the features of originality between Matthew and Mark. The first in the field was Gustave d'Eichthal (*Les Évangiles*, vol. i. 1863), who is in the main inclined to Matthew, and discovers in Mark distortions of the traditional accounts. The case of the latter is judged somewhat more favourably by Klostermann (*Das Marcusevangelium*, 1867), who makes out Mark to be not only the *pedissequus Matthæi*, with Augustine, but also the speaking-trumpet of Peter. And similarly Grau in his *History of the Development of the New Testament Literature* (vol. i. 1871), the theory of which is the mutual dependence of Matthew and Mark, resulting in the predominance of the collection of *λόγια* in the one case, and of the oral communications of Peter in the other. Professor Weiss, too, with whom we are more immediately concerned, has been endeavouring from time to time in the course of the last ten years to establish a middle position. He still maintains the (in our opinion) unnatural and untenable theory that our second gospel is based at once on the record left behind by Matthew and on the oral teaching of Peter. The former, i. e. the *λόγια*, combined with our present Mark, seems to have formed the foundation for our present gospel of Matthew.

Two points will at once occur as questionable. First, that on Dr. Weiss' theory the work of Matthew was already known by our second evangelist. And next, that it is supposed to contain not only discourses but narratives from the first appearance of the Baptist to the story of the Passion.

The former view is held by Weiss in common with Ewald and Meyer; the latter, so far as we know, has only been adopted by Wiesinger. Both views, of course, hang together. For since no discourses of any length are reported by Mark, except the Judæo-Christian apocalypse in the thirteenth chapter, the work of Matthew (if Mark made use of it) must have contained a narrative element. And so the group of sketches in our present Mark will fall into two series: (1) a larger one containing such as are based on the recollections of Peter, which would naturally be sporadic and unconnected, and may be recognised by their picturesque details; and (2) a smaller one, comprising those edited after the aphoristic notes of Matthew. It is obvious that in such an accidental combination of elements no reliance can be placed on the plan and sequence of the parts, and if for no other reason the adherents of the strict "Mark-hypothesis" must protest against the partial nature of the support given to them by Weiss. "The peculiarity of Mark's composition is the way in which, through the succession of single pictures and groups of narratives, he brings into relief the pragmatic progress by which, according to his general theory, the public life of Jesus was distinguished." These words of Dr. Weiss almost remind one of Volkmar, who explains the whole of Mark as a Pauline system of dogmatics in a historical form. The only distinction is this, that Volkmar explains the entire contents of the second gospel as a purely imaginative composition, as Baur has done with regard to the fourth, while Dr. Weiss cannot admit the slightest doubt of a delineation based on a twofold apostolic testimony. As a rule he thinks it superfluous to touch at all on this side of the matter. If, on the other hand, the framework, into which Mark succeeds on the whole in bringing the life of Jesus, corresponds not so much to real history as to the "general theory" of Mark, this is not displeasing to a theologian who, like Dr. Weiss, assumes the historical character of the fourth gospel. Others, like ourselves, will regret to see the important results of the "Mark-theory" called so needlessly into question, and that by one who has so little perception of the transitions of style as to regard viii. 27-x. 45 as a connected section relative to the training of the disciples.

Our author's criticism of the well-known hypothesis of Griesbach, according to which our present Mark is an epitome of the first and third gospels, is excellent. That hypothesis is, however, far from being extinct. In particular, the lives of Jesus by Strauss (second edition) and Keim proceed from the same assumptions (not, indeed, maintained at all strictly by the latter), and Zeller (*Vorträge u. Abhandlungen*, 1865, p. 442, foll.; *Zeitsch. f. wiss. Theologie*, 1865, p. 308, foll.; p. 385, foll.) has attempted both upon general grounds and by special instances to prove that they are still valid.

This school of critics has been answered by Hilgenfeld (1866, p. 91, foll.) and Hanne, and also by Weiss, who observes that Strauss and Keim have only pointed out the extreme consequences of the unfavourable verdict on Mark, but not succeeded in finding any traces of a later age, and still less in making at all distinct the compromising tendency ascribed by the Tübingen school to the supposed epitomator (p. 8). He also makes some short but telling remarks on scholars, who, conscious of their own incapacity to solve the synoptic problem, find it convenient to deny the facts *in toto* as inventions of the modern mania for hypothesis (p. 10). Thus a Roman Catholic, Dr. Friedlieb (*Prolegomena zur bibl. Hermeneutik*, 1868, p. 127, foll.), refers everything to the oral teaching of the apostles (!), and a Protestant theologian, M. Godet, in his *Commentaire sur l'Évangile de saint Luc*, has tried to show in detail that the principle of oral tradition is

on the one hand so sound, and on the other so elastic, as to explain all the difficulties whether of coincidence or divergence in the synoptic gospels.

It may not be out of place to remark that the present writer has found no reason to abandon his own hypothesis, which, in spite of some modifications in details, still appears to him as that which accounts by the simplest means for the largest number of phenomena. As a test of its correctness, applied to the observation of details, the reader may be referred to a paper on the original position of Luke vi. 39, 40, Matt. xv. 14, x. 24, by W. Brückner (*Studien u. Kritiken*, 1869, p. 616, foll.). A successful effort to popularise synoptic researches has been made by E. Zittel in his work, *Die Entstehung der Bibel* (1872, p. 103, foll.), which may also be recommended as a thoroughly readable summary of Biblical investigations in Germany.

The recent revival by Noack of the theory which makes Luke the earliest of the evangelists is curious, and nothing more. The point really at issue is whether Matthew or Mark has the priority, and how nearly unanimous the supporters of the latter have become may be seen from Ewald, who, in his latest work (*Die drei ersten Evangelien und die Apostelgeschichte*, vol. i. 1871), approximates more closely than before to the view of the present writer. He now thinks that the collection of λόγια had already been rendered into Greek, when it was employed by the authors of our synoptic gospels. In relation to Mark, his procedure seems to us by far too artificial, that writer's sketch of the life of Jesus having been combined, according to Ewald, with Matthew's collection of λόγια. The work thus produced was known, he thinks, to the authors of the first and third gospels in a more complete form than we now possess; the sermon on the mount in particular has dropped out of the text at Mark iii. 19. It follows that the remarks of Dr. Weiss (p. 18) on Ewald's position are inaccurate, although the views of the latter in their present modified form were published as long ago as 1850. As for Dr. Weiss's further remarks against the hypothesis of the present writer, they are met by anticipation in contributions of the latter to Schenkel's *Bibel-Lexicon* (vol. ii. pp. 207, foll.; 217, foll.; 416, foll.; and vol. iv. pp. 67, foll.; 121, foll.; 135, foll.), to which the reader may be referred.

H. HOLTZMANN.

**Paul of Tarsus.** An Inquiry into the Times and the Gospel of the Apostle of the Gentiles. By a Graduate. Macmillan.

THE style of this work reminds us much of *Ecce Homo*. Indeed the similarity both of style and (we might add somewhat conjecturally) also of standpoint is so great that we might have been led almost to identify the writers. We miss, however, in *Paul of Tarsus* that admirable method and clearness of development which was characteristic of *Ecce Homo*; and the style, along with striking resemblances, is inferior in reserve and self-command.

The book is not, as might be supposed, a life of St. Paul, or a progressive sketch of the course of Christian theology. It presents, so to speak, a horizontal rather than a vertical section of the apostolic age. It depicts the conditions under which St. Paul lived, the sort of ground on which he worked; and it also gives a general outline of his teaching. But it does not trace (except here and there incidentally) the successive development either of his missionary career or of his theology. It is a bird's-eye view of the whole seen at once.

The writer is fond of dealing with things in masses—broadly, and by means of a few prominent instances, rather than with any minuteness of detail.

He cuts the critical knot at once in the preface by accepting all the writings attributed to St. Paul—except, of course, the Epistle to the Hebrews—as genuine (pp. vi, 56, 105, 178). It is the major premiss of the negative criticism that the author contests; he admits the facts observed by the critics, but denies that they prove so much as they are supposed to do. The Acts are sparingly used; and the critical difficulties that arise in connection with them are therefore not discussed.

The broad and general mode of treatment that the author has adopted removes for the most part the occasion for criticism; but in some cases we think that it has led him into mistakes. Thus an impartial review of the evidence compels us to place the establishment of episcopacy considerably earlier than the middle of the third century (p. 144). Too much is made out of a single expression in the famous passage of Justin (ὁ προσεπώς, *Apol.* i. 65—Nablosus, by the by, is Sichem, not Samaria, p. 116). His apology was addressed to a heathen, and would naturally avoid technical terms. But our author seems to have forgotten the Epistles of Ignatius.

Then we think he is a little too hard upon celibacy. After all Fra Angelico, Savonarola, and Michel Angelo were celibates; and the relation between their celibacy and their excellence is not altogether accidental. It is true that celibacy has been abused by being made a compulsory institution; true also that St. Paul advocated it for special reasons. But these reasons are such as may recur. "Every man hath his proper gift of God, one after this manner, and another after that."

We agree with the author in the main; but we think that he takes sides a little too much, and does not always do full justice to that to which he is opposed. He cannot dismiss from his mind the controversies of the present in dealing with the past. Anything that is hierarchical, ascetic, or dogmatical, arouses his wrath. On the other hand, he takes a peculiar interest in all the political and secular side of St. Paul's activity; and his sympathies or antipathies are thus continually engaged.

The work is essentially that of a layman, widely if not deeply read, and a master of vivid presentation. For ourselves we should perhaps at times prefer somewhat quieter tones; but that is a matter of taste. The author seems to us to be moving—both in what he rejects and in what he retains—in the right direction: and there can be no doubt that his book will have a stimulating influence, though it does not enter sufficiently into detail to make any marked addition to our knowledge of the life and theology of St. Paul.

W. SANDAY.

### Intelligence.

M. Émile Burnouf's *La Science des Religions* (Paris: Maisonneuve) is about to appear in a new and, we may hope, revised edition. The book is not without literary merits, and the introductory chapters contain some intelligent and well-timed remarks. But the author's application of his method is the most perverse which it has been our lot to meet with since the unhappy works, one of which is appealed to as an authority by M. E. Burnouf, of Mr. Ernest de Bunsen. The least unsatisfactory portion is that on the religions of the eastern Aryans, yet there is nothing even here to indicate that accurate knowledge of the sacred writings which we have a right to expect from a Burnouf. "The Zend-Avesta," we are told, "contains explicitly the whole metaphysical doctrine of the Christians." "Almost all the elements of the legend of Christ are found in the Veda." "[The central event of Holy Week] is twofold: it is at once and in an indissoluble manner the resurrection of Christ and the renewal of fire." "At last [in the Office for Holy Saturday] Christ appears under his true name of *Agnus*, which may well be *Agni* under a Latin form. Then they recite the following prayer, where in a few phrases the 'mystique' of the whole paschal rite is expounded: 'O night truly happy, which has despoiled the Egyptians (in the Veda, the Dasyus) and enriched the Hebrews (the Aryas)!' &c." "The re-

ligion of Christ has not come to us from the Semites, but 'the ancient law' contained a portion of Aryan doctrines which Jesus came 'not to destroy, but to fulfil.' "The mass of the people of Israel were Semitic, and attached themselves to the worshippers of Elohim, personified in Abel. The others, who have always formed the minority . . . were probably Aryas: their principal centre was fixed to the north of Jerusalem in Galilee." "It [Genesis] simply reproduces, under an abridged and diminished form, the Aryan traditions of central Asia." Such gross perversions of facts cannot be allowed to pass without an expression of surprise at the levity of the author and the credulity of the reading public.

A revised edition of Knobel's commentary on Isaiah, by Professor Diestel, requires no commendation. It was manifestly too soon after the last edition to think of entirely recasting the work; hence the additions are for the most part confined to notices of the views of more recent commentators (Delitzsch, Cheyne, Seinecke), and references to Assyriological researches, which will prove of great value to the student.

We may also call attention to Wellhausen's critical notes on the text of the books of Samuel (slightly crude, but more methodical than Thénien), and to the accurate edition of the Palestinian text of Isaiah, by Baer and Delitzsch.

### Contents of the Journals.

**Studien und Kritiken**, 1872, No. 4.—Schürer on the ἀρχιερεῖς in the N. T. [The term includes all the members of the families from which the high-priests were chosen.]—Grimm on the problem of 1 Peter.—Bender on the question of miracles.—Zyro on Matt. vi. 11, and on James iv. 5.—Sayce on the besieger of Samaria, with Schrader's remarks. [Seems to have been written a good while before publication.]—Kamphausen on *The Speaker's Commentary*. [A more lenient judgment than might have been expected from the editor of Bleek's *Introduction to the Old Testament*; and one cannot help feeling that it has been slightly influenced by a supposed representative character which attaches to the *Bible Dictionary* in a much higher degree than to *The Speaker's Commentary*. The latter work, in fact, represents but a section of the actual church of England. "Credit is due," according to the writer, "for the diligence with which the church-version has, even in minor points, been tested by the original." . . . "Yet it must be said that much more might have been done if the Anglican scholars had displayed a higher degree of care and tact in linguistic matters." With regard to exegesis, the verdict is still less favourable, for "this [commentary] absolutely repudiates the scientific character, inasmuch as it is almost throughout subservient to the false [kind of] apologetics." Just praise is given to the treatment of geographical and archaeological points; also to the abstention of the writers from polemical bitterness and homilistical unction. A sense of humour is shown in directing the student's attention to concessions inconsistent with "orthodoxy."—Engelhardt on Spiess' *Logos Spermaticos*.

**Jahrbücher für deutsche Theologie**, vol. xvii. No. 2.—Principal Reviews:—Schröding and Märker on passages of Samuel; English works on Isaiah; by Diestel.—Meyer and Overbeck on Acts; by W. Schmidt.—Weissenbach on James ii. 14–26; by Weizsäcker; and (together with Hultner on James) by W. Schmidt.—Weiss on Mark; by Wiesinger.—Heinrici on the Valentinian Gnosis and the Holy Scripture; by Weizsäcker. [Severe.]

**Theolog. Literaturblatt** (Rom. Cath.), June 4.—Berger and Zürcher on the history of the Constance council; rev. by Schwab.—Weiss on Basil and the two Gregories; rev. by Reusch.—June 18.—Reinke's *Beiträge*; rev. by Reusch.—Schröder's *Sanct Brandan*; by Birlinger. [An Irish legend transported to Germany by the Scottish monks.]—July 2.—Grau's *History of N. T. Literature*; by Langen. [Full of original views, but separated from the necessary proofs.]

**Monatsschrift für Gesch. u. Wiss. des Judenthums**, June.—The integrity of chaps. xxvii. and xxviii. in Job; by Dr. Grätz. [These chapters are inconsistent with the previously expressed sentiments of Job, but very suitable for Zophar. According to the present arrangement, the latter only speaks twice, whereas the other two friends speak thrice. The introductory formula has dropped out of the text.]—July.—The Sources of the Philonian Logos.—The Additions in the LXX. Version of Job; by P. F. Frankl. [Drawn from an old Aramaic Targum.]—Register of Sins in Ewald's *Hebrew Grammar*. [Professedly "out of respect for the public and regard for the dignity of science;" but there is room for doubt. The author rates the respect of Christian scholars for Ewald's authority far too highly. And it seems to us both paltry and useless to irritate the feelings of a great scholar, who once led the van of Semitic philology. It would be a consolation to a less generous mind than Ewald's to think how easily any non-Jewish scholar might pull to pieces some of the philological articles in the *Monatsschrift*.]

**Jüdische Zeitschrift** (ed. Geiger), vol. x. Nos. 1 and 2.—The Moral and Date of the Book of Tobit; by A. Kohut. [A covert polemic against the Zarthustrian prohibition of interments, which was extended to the Jews at the date of the composition of the book (in Persia, probably under Ardeshir I.)—Wellhausen on the Books of Samuel. [A very valuable review.]—Kohut's Persian translation of the Pentateuch by Tavus. [Criticism of details.]

### New Publications.

**BIBLIA SACRA**. Codex Vaticanus. Tom. III. (Psalms—Sirach; ed. Vercellone et Cozza.) Romae: Spithoever.

**CYRILLUS**. In S. Joannis Evangelium. Accedunt in D. Panli epistolae quaedam fragmenta etc. Ed. P. E. Pusey, A.M. Oxford: Clarendon Press.

**HOLTZMANN**, H. Kritik der Epheser- und Kolosserbriefe. Leipzig: Engelhardt.

**JESAIAH**. Textum Masoret. accuratissime expressit, e fontibus Masorae varie illustravit etc. S. Baer. Praefatus est Fr. Delitzsch. Leipzig: Tauchnitz.

**MAI**, A. Nova Bibliotheca Patrum. Tom. VIII. Ed. Cozza. Romae: Spithoever.

**PROPHETAE CHALDAICE**. P. de Lagarde e fide cod. Reuchliniani ed. Leipzig: Teubner.

**SCHOLTEN**, J. H. Der Apostel Johannes in Kleinasien. Aus dem Holländischen. Berlin: Henschel.

### Physical Science, &c.

**Le Soleil**. Par le P. A. Secchi, S.J. Paris: Gauthier-Villars, 1870.  
**Spectrum Analysis** in its Application to Terrestrial Substances and the Physical Constitution of the Heavenly Bodies. By Dr. H. Schellen. Translated by Jane and Caroline Lassell, and edited with Notes by William Huggins. Longmans, 1872.

WE know of nothing which gives us a higher or more hopeful idea of the possibilities of modern science than the progress which has been made during the last five years in the study of the sun by the new method; a method the enormous power of which is not yet recognised whether we consider either the work it is capable of doing or the influence which the generalisations which it renders possible must have upon the science of the future.

What has already been accomplished in this time? Faye's beautiful but unsound theory as to the nature of sun-spots has been entirely swept away, while the idea of Wilson, that sun-spots are cavities, has been absolutely established—a result which it seemed almost hopeless to arrive at by the telescope alone, seeing that even the great Kirchhoff thought himself justified in considering them as clouds. But much more sound and certain knowledge than this as to the nature of sun-spots has been gained: the vapours which affect the spot-level are now in part known; what happens to spots in the various divisions of the sun-spot period is now more than suspected; the velocity of the currents of the various vapours in the spot itself, as contradistinguished from that at higher levels, has been determined, while we are rapidly accumulating knowledge which we may hope will soon enable us to state the exact cause of the formation of a spot.

To the outsider, however, most of the interest attaching to the recent work is associated with the prominences—and perhaps with reason, for here the unfolding has been of a really startling character to him. For the first time we have been permitted to enter into the mysteries of an unseen world, where the visible is beggared at every step. The eye and the telescope together tell us of a sun wondrous in its spots and its faculae, and there the record ends; but now the astronomer, as it were, "feels from world to world," and the spectroscope enables him to detect action as far removed from those ordinarily known to occur in the sun's atmosphere

as the rushing hurricane is from the quiet ripple on some fern-girt pool. But if the new knowledge thus acquired has been of the sensational sort, it has at the same time been of surpassing value, embracing solar chemistry as well as solar physics and meteorology. Not only can we now watch tremendous eruptions from the very bowels of the sun; the descent of the cooler materials; and the effect of mighty rushing winds, but we can divide the solar atmosphere, so to speak, into shells, and name the constituent materials, some of them new elements, of these shells, their simpler nature as we get higher in the sun's atmosphere being due to a thinning out of the various gases and vapours.

From these and other results, to which the space at our disposal does not allow us to allude, we have a thousand new problems to attack in solar physics. The spots have been found to have periods at which they are most and least numerous. Then is not this so with the prominences? Are the materials of the prominences always the same? Do they appear in zones as do the spots?—are types of hundreds of questions which will soon be answered.

But this is not all. This solar work has given a life to terrestrial spectrum analysis that it did not possess before, and discovery in this branch of knowledge has gone on hand-in-hand with the new outcomes regarding the sun. The changes which take place in the spectra of the same substances submitted to different conditions have been studied, and the results of these enquiries have tremendous bearing not only upon the spectrum of the sun, but upon the spectrum of every star that shines. Hence a host of other enquiries. Do the lines in the solar spectrum change as well as the spots on the sun's surface? Is their thickness always the same?—and then, knowing that this varying thickness is due to varying pressure, as the varying brightness is due to varying temperature, we have the further queries, Is the pressure of the hydrogen or the magnesium vapour visible outside the sun always the same?—and, finally, Is the sun always of the same size?

These results, and these enquiries directly founded upon them, are on such a stupendous scale that the interest connected with them has broken bounds, and we find the general public as anxious to be informed as to these matters as scientific men themselves: hence a demand for popular expositions not only of the recent discoveries, but of the processes on which the new work is based and of the associated facts.

The two books at the head of this article are among the attempts which have been made to supply this want: one of them is by Father Secchi, the Directory of the Observatory of the Roman College; the other by Dr. Schellen, Director of the Realschule at Cologne. The books are, moreover, to a certain extent complementary to each other, as in the one we find the new work discussed in relation to the sun, while in the other spectrum analysis—the method of the work—is the author's keynote.

Let us deal with Father Secchi's book first. In the first part, that dealing with the structure of the sun, we are introduced to the general aspect of the sun, and here, in the first hundred pages, we have certainly the most valuable part of the volume, for Father Secchi has a fine telescope, and observes in a locality where at times the air is peculiarly pure; and as the various detailed descriptions are accompanied by drawings, many of them never before published, an exceedingly good idea may be gathered by the general reader of this class of observations, more especially as here and there very practical descriptions of the method of work are given. We may especially refer to pp. 66–80, in which the *voiles roses*, now and then seen in spots by means of the polarizing eyepiece in which no coloured glasses are employed, are referred

to. The history of the spot of 23rd January, 1866, will be read with the greatest interest.

It is to be regretted that the author has not preferred to postpone his general conclusions until the reader is in a position to bring all the now available knowledge to bear upon the enquiry, and that the conclusions are so scattered, and at the same time so contradictory, that Father Secchi may claim to have promulgated any of the ideas on sun-spots which may hereafter come to be established. At p. 64 we have two hypotheses given as to the formation of sun-spots, one the up-rush theory, the other the cyclone one. On this we read: "Nous pouvons regarder la première opinion comme plus probable; le mode de formation des taches semble bien indiquer une éruption de l'intérieur vers l'extérieur;" elsewhere we find the cyclone preferred. This, however, is a detail compared to Father Secchi's explanation of the dark appearance of sun-spots which he appears to have settled entirely to his own satisfaction. Before we refer to this, however, we must say one word by way of introduction touching the hypothesis of Faye, to which we have before referred. Faye imagined a gaseous nucleus of intensely heated but feebly radiating gas. Balfour Stewart objected to this that a gas, if it were a feeble radiator, would be a feeble absorber, and that therefore we should see the photosphere on the other side of the sun through this gas. Father Secchi, who does not seem to see the reasoning on which this objection is based, writes: "On a objecté que le soleil ne saurait être gazeux sans être transparent," and then refers to the *absorption* in our own and the solar atmosphere to prove the contrary. Here, again, Father Secchi must take his choice. If the sun's interior is hotter than the exterior, as he affirms elsewhere, these objections are those of one ignorant of the matter.

The other portions of the work are chiefly remarkable for the skilful manner in which the author gives the idea that in all the recent progress he alone has borne the heat and burden of the day. Father Secchi has an idea of solar planetary tides; he therefore states that the Kew pictures have not yet been reduced: he refers to the work which has established that sun-spots are regions of greater relative absorption. Here he states his conclusions have been *endorsed* by an observer who published the discovery some time before Secchi had repeated the observation. Father Secchi has not yet apparently observed with sufficient optical means to enable him to detect the alterations of wave-length due to the motion of the various gases and vapours (although he has stated that he has noticed an alteration of wave-length which he could only have seen had the sun's rotation been some hundred times more rapid than we know it to be!); hence, in a line, he discards all reference to the precious knowledge that has been acquired by this method of research. In the account of the use of the pile we find no mention of Henry, while the types of stars are not referred to Rutherford, as they should have been, and so on. Surely there should be nothing more disastrous for the reputation of a scientific man than such unfair dealing as this. It might be passed over with small notice in the production of a literary hack, who writes to sell, and who spices his productions with personalities in order that they may sell the better; but Father Secchi is not a literary hack, and he is not compelled to write books, and, when he does, he should add to his reputation for scientific research which has covered a wide field by placing it before the world with a higher regard for justice than that he has shown in too many instances, especially in regard to English work.

In Dr. Schellen we have an author much less practically acquainted with the researches on which he treats than Father Secchi, and to this must be attributed not only a

want of arrangement here and there, where we find the same work taken up over and over again, and the point of some of the recent observations and experiments missed—whence comes a curious rating of their importance—but also now and then an apparent unfairness, which will strike the reader conversant with the subject, but which, we believe, is unintentional.

We have first a description of the artificial sources of light and heat, followed by an account of the properties of light and of its analogies with sound, refraction, of course, holding a high place. We then get several chapters describing the various simple and compound spectroscopes in use, and the methods of showing and observing the various phenomena are stated. In the third part of the volume, the application of spectrum analysis to the study of the various celestial bodies is stated at great length. Here the illustrations are of the highest order, and the reproductions of the various standard maps of the solar spectrum are simply perfect, while full reference is made to the memoirs both of Kirchhoff and Ångström, as well as to all the recent memoirs touching both sun, stars, comets, nebulae, and so on, the recent eclipse observations being also discussed.

This must suffice us as a general description of the plan of the work.

In fact, the attempt made by Schellen is on the whole admirable in design and perfect in tone; and had the English translators, the Misses Lassell—who have done their part of the work in a most creditable manner—been fortunate enough to have found an editor competent to set themselves and the author right where a detailed knowledge of the subject was required, and with the same desire to do justice as the author himself has shown, the book might have been made as perfect as to the text as it is in its general scope, and its illustrations. Instead, however, of “crowning the edifice,” and supplying defects, the editor has chosen to mar its symmetry with glaring blotches in the worst possible style.

Thus, in the elementary portion of the subject, we are treated to the terms “refractory index,” p. 386; “position of minimum of (*sic*) deviation,” p. 78; and we are told, p. 89, that “the *dispersion* of light is therefore to be clearly distinguished from *refraction*,” the term deviation not being introduced. On p. 90 we have the general statement that “if the whole length of the solar spectrum be divided into 100 equal parts, the proportions of the colours will be as follows—red 12, orange 7, yellow 13, green 17, blue 17, indigo 11, and violet 23,” without a word of reference as to the material of the prism, or to the irrationality of the spectrum. At p. 101, where continuous and discontinuous spectra are introduced, we find no word of the important discovery made by Frankland, that at high pressures the spectra of gases and vapours are as continuous as those of solids or liquids. On p. 115 we find the differential action utilised in direct-vision spectroscopes lucidly described as due to the “remaining rays” after the “dispersive power of the flint-glass” has been “partially destroyed” by the crown-glass. On p. 48 the separation of the poles of the electric lamp is thus described: “The separation is accomplished by the racks *c* and *l*, which before moved forwards, being made to go backwards by means of two connected cog-wheels, which can back them in either direction, a contrivance which helps to make the electric lamp one of the most complicated,” &c. On p. 431, “motion-forms” of prominences, that is, the apparent forms seen with a fine slit, and due to alterations of wave length merely, are given as the actual forms of prominences! But after all, these are small matters, which are referred to as showing that the ordinary duties of an editor have to a large extent been

neglected. What then has the editor done to the book? He has “enriched” it with notes against many of which, I believe, every true man of science who takes up the work will loudly protest. Having in an evil moment promised to review the book, I am bound to keep my promise, but the task of reading through these notes I confess has been one from which anyone having any belief in the ennobling influence of scientific work might well shrink. Let me quote one:—

“In Mr. Lockyer’s communication to the Royal Society in October, 1866, there was no statement of a method of observation or of the principles on which the spectroscope might reveal the red flames. His suggestion consisted only of the following question: ‘May not the spectroscope afford us evidence of the existence of the red flames which total eclipses have revealed to us in the sun’s atmosphere, although they escape all other methods of observation at other times?’”—P. 417.

This requires no comment, except that it is noteworthy that this craving to deprive others of credit should be so closely associated with such a lack of skill; for it is confessed, p. 378, that, “when the position of the lines was known, Huggins saw them instantly with the same spectroscope (two prisms of 60°) which he had previously used in vain.”

The author’s account of the methods of viewing the prominences has given the editor an opportunity of treating the book in his peculiar manner. Let us take Sir John Herschel’s description of the two methods.\* We have first the reference to Mr. Huggins’ arrangement, which consisted in “widening the slit sufficiently to admit of the whole prominence being included in its field, and absorbing the light of other refrangibilities so admitted by a ruby glass;” by these means “he was enabled distinctly to perceive *at one view* the form of the prominence.” We then read, “Almost immediately after, Mr. Lockyer succeeded, by merely widening the slit of his spectroscope, *without the use of any absorptive media*, in obtaining a clear view of the forms in question.”

In the opinion of Sir John Herschel, then, there certainly was a difference between the two methods, and yet the editor charges the author with inaccuracy when he refers to this difference.

But this is not all. In Mr. Huggins’ communication to the Royal Society we read:† “A spectroscope was used; a narrow slit was inserted *after the train of prisms, before the object-glass of the little telescope*. This slit *limited the light entering the telescope* to that of the refrangibility of the part of the spectrum immediately about the bright line coincident with C.” Observe the reiteration, “after the train of prisms,” “before the object-glass of the little telescope,” limiting “the light entering the telescope.” Although the veriest tyro will recognise the absurdity of this position of the slit to serve the purpose stated, the position is referred to no less than three times. The editor now rewards the generosity of those who have hitherto refrained from pointing out this monstrous blunder by asserting, in a foot-note to the book under notice, as a correction to his communication to the Royal Society, that “the slit was placed in the focus of the small telescope, and not before the object-glass” (p. 423). The value to be placed on such a statement as this, in such a connection, we will leave the reader to determine.

Enough, however, of these parasitic growths, which, we trust, will disappear in a second edition, in the interests of author, translators, and publisher, all of whom deserve the thanks of all true friends of science for the production of this magnificent volume, which in its present dress, it must

\* Herschel’s *Outlines of Astronomy*, 11th edition, p. 723.

† *Proc. R. S.* vol. xvii. p. 302.

again be pointed out, is due to the efforts of two accomplished English ladies. May we hail this as a sign of the times!

J. N. LOCKYER.

### Notes and Intelligence.

The *Quarterly* has a carefully reasoned and, on the whole, penetrating article on Mr. J. S. Mill: somewhat too fragmentary and *déroulé*, being rather an aggregate of criticisms on special points in his works than a real criticism of his philosophy. The reviewer seems to want the faculty of synthesis, the absence of which he signalises as a defect in Mr. Mill—a charge which is partly just, and partly mistakes for want of comprehensiveness in view and effort a cautious determination to state only definite results. The writer considers Mr. Mill's strength to be shown neither in the region of practice nor in that of the most abstract speculation, but in dealing with "the broad conceptions which are neither traced back to the fountain-head nor forward to the final issue, but which are based on reality and therefore strong." This estimate seems judicious, and so do most of the detailed criticisms, with the exception of an attack on the familiar economic proposition that the effective demand for labour is that of the capitalist and not of the consumer: here the critic's objections seem perverse and superficial, and his style unwarrantably supercilious and violent. But most of the metaphysical and logical points are well taken: as (1) that Mr. Mill follows at once the mentalistic and materialistic lines of phenomenalism without really reconciling them; (2) that he has qualified his nominalism till it has become conceptualism without his being aware of it; (3) that in attempting to distinguish "cause" from "actually constant antecedent" he has to introduce the notion "unconditional," while yet holding that not even the law of causation can be unconditionally affirmed. However, in his remarks on this latter point, the reviewer makes it evident that (though the article is entitled, "Mr. J. S. Mill and his School") he has not read Bain's *Logic*, where the causal nexus is referred to persistence of force. This extension of his reading might have modified his surely unfounded charge against this school as "ad dictos jurare in verba magistri." Every writer of Mr. Mill's influence has a crowd of followers of this sort: but no one has done more to foster independence of thought in the really serious thinkers who received their first impulse from him. The reviewer must have been thinking of philosophers of the dinner-table or the daily press.

### Geography.

**A New Caravan Route from Wadai to Egypt.**—Writing from Alexandria to the president of the Italian Geographical Society, M. Jules Poncet says: "A perfectly new route through the Sahara to Egypt has been opened. About forty-five days ago (from July of last year) a great caravan of 2000 camels, with 400 cwts. of ivory, several cwts. of ostrich feathers, tamarinds, and from 700 to 800 slaves (the number remaining of 3000 who started with the caravan), came from Wadai to Egypt, reaching the Nile two or three hours' distance below the pyramids of Gizeh, without having touched upon the route from Siout to Darfur. This is a new source of wealth for Egypt, and of misfortune for the victims of slavery." Commenting on this in the *Mittheilungen*, Dr. Petermann remarks that as yet there is not one direct route known from Wadai to Egypt. Fresnel, indeed, notices that from Kebabo, the chief point in the oasis of Kufarah, lying on the trade route from Wadai to Bengazi, an old route passes to the eastward, which probably led to the Egyptian oasis of Dakhel, while some degrees southward traces of an ancient way to Egypt, branching eastward from the former, are said to have been found. Has one or other of these abandoned routes again been brought into use, or has this great caravan chosen a new course? We would strongly urge upon Europeans living in Egypt the importance of examining this question; by this means they, like Fresnel, could render important service to the geography of the unknown eastern Sahara.

**The Topography of Europe.**—Since the year 1856, Herr Emil von Sydow has annually published in the *Mittheilungen* careful reports on the standpoints of European cartography, which by their great critical value have had an influence on both government and private undertakings. In his last report, which appears in the current number of the journal, von Sydow, in dealing with the Austrian government maps, draws attention to the great importance of the adoption of a scale uniform with that which has been found most suitable in other parts of Europe. It has been proposed in Austria to reduce the original manuscript surveys of the country, which are on a scale of  $\frac{1}{35000}$  of nature, to that of  $\frac{1}{75000}$  (a little less than 1 inch to 1 English mile) for the permanent topographical map of the country. Herr von Sydow is of opinion that a reduction to  $\frac{1}{100000}$  would be in every way more suitable: firstly, because this scale would amply suffice to clearly show by far the greater part of the natural or cultivated features of the Austro-Hungarian

Empire; and, secondly, because in those parts which are very minutely and artificially divided, the scale of  $\frac{1}{35000}$  would not be sufficiently large, and a change to  $\frac{1}{100000}$  for these districts would be desirable. He arrives at this view after many years' use of maps of France, Belgium, Rhenish Provinces, and Westphalia, which are drawn on the closely neighbouring scale of  $\frac{1}{35000}$ . Prussia is on the point of altering the scale of its map of the western parts of the monarchy from  $\frac{1}{35000}$  to  $\frac{1}{100000}$ , and this change will render the entire map of northern Germany uniform. Saxony has fixed the scale of its new survey map at  $\frac{1}{100000}$ ; the Dufour map of Switzerland is also on this scale; and the countries of South Germany which lie between them must soon adopt it; Sweden and Norway in the north, and Italy southward, have chosen the  $\frac{1}{100000}$  scale, and yet between these it is proposed to have a map of the whole Austrian Empire on one slightly larger. This scheme cannot but be strongly deprecated, as it is directly opposed to all ideas of international unity; should it be carried out, and the map be prepared on the  $\frac{1}{35000}$  scale, a change to that which has been more generally adopted could only be looked for after a long lapse of years. Perhaps a reduction to  $\frac{1}{100000}$  may yet be determined on; we suggest it in the interests of many.

### Physiology.

**The First Stages in the Development of the Ova of the Common Trout.**—Dr. Klein gives a good description of the first stages in the development of the trout (*Salmo fario*) in the fifth number of the *Monthly Microscopical Journal*. He states that up to the sixth hour the fertilised ovum presents a nearly uniform aspect under the microscope. It appears as a dull globe enveloped in a thick vitelline membrane, with irregularly distributed fat-globules. The earliest time he was able to perceive an indication of the blastoderm was after five hours and forty-five minutes, when it appeared as a small, more opaque, irregularly outlined spot, around which the fat-globules are accumulated; at the tenth hour the blastoderm is elevated into a little mound lying in a saucer-like depression of the yolk, and soon after it exhibits slow amoeboid movements. A median furrow then appears, which, some hours later, is crossed by one at right angles, these two furrows being visible at the end of the first day. At the end of the second day the surface of the blastoderm is so divided by furrows as to exhibit eight knobs, but after this the arrangement of the knobs or of the intervening furrows is irregular. Segmentation of the blastoderm into a mulberry-like mass is completed in nine days at the shortest. As regards the expansion of the blastoderm on the saucer-like depression of the yolk, and the large elements which are to be found on the bottom of the segmentation cavity, Dr. Klein compares the growth of the blastoderm round the yolk globe to a cap, the peripheral part of which is thickened, and in regard to the foundation of the embryo at the peripheral thickening, he has but little to add to the account given by Stricker in Max Schultze's *Archiv*, vol. v. Dr. Klein considers the large elements at the base of the segmentation cavity to be products of the blastoderm; that is, they are left behind upon the saucer-like depression of the yolk, as the blastoderm is lifted from the yolk. The first trace of the embryo is a knob-shaped prominence, which slopes towards the centre at one spot of the peripheral thickening at about the fifteenth or sixteenth day after fecundation. On the following day this prominence projects still farther inward, and the internal, or what afterwards becomes the cephalic, extremity stretches like a cord towards the centre of the germinal area. The first indication of a dorsal groove appears at the cephalic extremity of the embryonal elevation; and from the sides of the latter, where the groove is deepest, two cords run forwards to the centre of the germinal area, and meet over the cephalic extremity of the embryo to form what may be called the "secondary elevation." On the twentieth day the blastoderm has grown round the yolk so far that a portion of the yolk no larger than a pin's head is exposed; on the following day the blastoderm has grown completely round the yolk. The presence of an opening, which subsequently becomes the anus, as Stricker and Rusconi describe, cannot therefore be admitted.

**The Amount of Caffein contained in Coffee, and its Action on the Body.**—Dr. Hermann Aubert contributes a long paper on this subject to the last part (xiii.) of *Pflüger's Archiv für Physiologie* for 1872. He observes that though the amount of caffein in the berry is well known, no researches have been made upon the actual quantity consumed in a cup of ordinary drinking coffee, and although the usual modes of preparation seem well adapted to exhaust the berry of all its useful constituents, there still remains various open questions whether it should be lightly or strongly roasted, whether one or more supplies of boiling water are required, and whether prolonged boiling is of any value. The same questions are unanswered in the case of tea. Opinions also vary in regard to the action of coffee: Johannsen denies the tetanising influence of coffee on muscle generally; Leven maintains that it excites and then paralyses the heart; whilst Falk and Stuhlmann admit only a remarkable retardation of the cardiac-beats as its effect. The author gives the following table to show the amount of caffein contained in raw coffee:—

	Per cent.
Graham, Stenhouse, and Campbell { Native Ceylon coffee . . . . .	0.87
Plantation . . . . .	0.54-0.83
Martinique . . . . .	0.36
Alexandria . . . . .	0.24
Robiques and Boutron . . . . . { Java . . . . .	0.25
Mocha . . . . .	0.21
Cayenne . . . . .	0.20
Domingo . . . . .	0.17
Dübereiner . . . . . { Mocha . . . . .	0.6
Versmann . . . . .	0.5-0.799
Pucetti . . . . .	0.4
Aubert (with chloroform) . . . . . { Yellow Java . . . . .	0.709-0.849

Aubert then describes his experiments in detail, which show: (1) That in our ordinary mode of infusion four-fifths of the caffeine is dissolved in the filtrate, scarcely one-fifth remaining in the grounds. (2) But little caffeine is lost when the bean is roasted till it is perfectly black, and the amount of extractive matter taken up by boiling water is almost the same whether the bean is slightly or strongly roasted. He thinks Frerich's estimate that a cup of coffee infusion obtained from one ounce of coffee contains from four to five grains of caffeine rather too high, and is wholly unable to explain Leven's extraordinary statement that every one consumes 1.7 grammes of caffeine daily. As regards the physiological action of caffeine, its most remarkable effects are the production of increased excitability of the spinal cord and tetanus. This last is produced in frogs by the subcutaneous injection of 0.005 of a gramme, in rabbits by 0.120 of a gramme, and in cats and dogs by 0.200 of a gramme, in the last three cases the solution being introduced into the jugular vein. Aubert was unable to obtain any evidence of increased excitability in the nerves or in the muscles; but the muscles, apart from the tetanus, become somewhat stiff. The tetanus is only of a transitory nature, and, if artificial respiration be maintained, soon disappears. The action of caffeine on the heart he finds somewhat complex. Its immediate effect is acceleration accompanied by diminution of the blood-pressure (showing in a striking manner the interdependency of these two conditions), due, he believes, to a more or less intense paralysis of the ganglionic nerves of the heart. Lastly, he doubts much that coffee owes its popularity to the caffeine it contains, but attributes this rather to its enlivening action.

### Botany.

**Modifications in the Habits of Plants through the Prolonged Influence of Climate.**—M. Alphonse De Candolle contributes to the *Archives des Sciences physiques et naturelles*, No. 174 (June 15), a record of some interesting experiments on the extent to which the habits of plants are modified by the climate of the locality where they are grown, a subject of considerable importance in connection with the question of acclimatisation. He obtained seeds of three species of European distribution, *Sisymbrium officinale*, *Senecio vulgaris*, and *Trifolium repens*, from widely separated localities—Moscow, Edinburgh, Palermo, and Montpellier—and sowed them, at the same time and under similar conditions, at Geneva, attention being specially directed to any differences they might exhibit during the period between sowing and germination and between germination and maturity. The general results arrived at were that the seeds originally from higher latitudes were somewhat quicker in germinating, and also somewhat quicker in arriving at maturity, than those from warmer countries; and this difference was developed to a greater extent in the second generation. M. De Candolle does not, however, consider the experiments to have been on a sufficiently extensive scale for much reliance to be placed on his results.

**Absorption of Water by the Leaves of Plants.**—Prof. Asa Gray, in a recent number of *Silliman's Journal of Science and Arts* (June), finds, as the result of the most recent investigations on this much controverted subject, that although, under normal conditions, plants absorb water only through the root and stem, yet when, owing to injury or any other cause, the stem is unable to perform this function, the leaves then acquire the power of absorbing it in the liquid, but apparently not in the gaseous form.

The present year has been rich in the commencement of several new journals devoted to botanical science. With January was started a fortnightly French magazine, under the title of *Journal de Botanique, pure et appliquée*, edited by M. G. Huberson, to contain original articles, translations, and extracts, with abstracts of the botanical communications to the *Académie des Sciences*. The first part of a new periodical, entitled *The Transactions of the St. Petersburg Imperial Botanic Garden*, is dated 1871, but has only recently reached this country. The *Yorkshire Naturalists' Recorder*, published under the auspices of the West Riding Consolidated Naturalists' Society, the first number of which appeared on July 1, is devoted to natural history in all its branches. Still more recently the first number has been issued of a small monthly periodical, entitled *Grevillea*, a medium of intercommunication of students in all branches of cryptogamic botany, edited by the well-known cryptogamist, Mr. M. C. Cooke. The *Journal of Botany*, edited, since the death of Dr. Seemann, by Dr. Trimen, of the British

Museum, has, since the commencement of the year, adopted the very useful practice of giving the titles of all articles on botanical science published during the preceding month, in all journals, both English and foreign.

### History.

- The Foundation of French Predominance in Europe.** [*Henrich IV. und Philip III. Die Begründung des französischen Uebergewichts in Europa, 1598-1610.* Von Dr. Martin Philippson. I. Theil.] Berlin: Franz Duncker, 1870.

THIS book could scarcely have appeared more opportunely. At a time like the present, when the European predominance of France has received so severe a shock, it will be of peculiar interest to observe the beginning of that development of which we are now witnessing the end.

The problem which Dr. Philippson has undertaken to solve had not as yet been considered in its full detail. The main outline was sketched in Ranke's *French History* in his usual masterly style, but the plan of his work did not allow him to go much into particulars. In 1857 Poirson's great work on *The Reign of Henri IV.* appeared, a model of accurate research and application, fully worthy of the "prize Gobert" which the French Academy twice awarded it. As to the inner development of France the book is invaluable and quite exhaustive; hardly any printed materials have escaped the author's notice. But owing to the sparing use made of documentary sources of information, he has not communicated much that is important as to foreign affairs. Philippson's book fills up this gap in a very convenient manner. On the one side, he has had a special eye to the political developments of the time; on the other, he was enabled to follow out the details of the history, and bring to light many new and interesting events and points of view. For the main importance of the book depends on the thorough and comprehensive researches made among the archives and libraries of Berlin, Brussels, and Paris, at which last place the Spanish documents from Simancas on this subject are preserved.

The author begins with the year 1598. Till that time the religious wars had distracted France at home, and crippled her influence abroad. Only when the peace of Vervins (May 2, 1598) had put an end to the civil wars, could the power of the state collect and develop itself. Here, therefore, the opportunity naturally offered itself for giving in the first chapter a comparative view of the condition of the chief European powers, especially of France and Spain. It soon becomes clear how the balance will incline between them at last, though not at the immediate moment. Spain, however great she may outwardly appear to be, has the germs of decay within her. Already the narrow-minded rule of

Philip II., despotic in political as well as in religious matters, had begun the change; under his successor, Philip III. (or rather under the incapable administration of his all-powerful favourite, the Duke of Lerma), it became still more visible. Exhausting wars, the colonization of foreign countries, the expulsion of the Moriscos, had even, under Philip II., reduced the population of Spain herself from 10,000,000 to 8,000,000. And how completely had every movement of life been checked in them! The liberties of the estates had been destroyed, all free utterance persecuted by the Inquisition, while the system of finance and taxation was the most irrational that can be imagined. The clergy held a fifth of the landed property; the Archbishop of Toledo had an income of 300,000 crowns (840,000 thalers), equivalent to at least three times as much at the present value of money. The high customs duties kept the provinces quite apart from each other; the export of coin was forbidden, commerce crippled by regulations that defeated their own object, especially by the "Alcavala," that is, the exaction of a tenth of all goods sold or exchanged. The home commerce would have been annihilated but for smuggling and fraud. Such statements, which we have no space to go further into, enable us to conceive how, notwithstanding the receipts from the colonies, the prosperity of the nation was always falling lower and lower, while the financial distress of the government continued to increase. Only the army, and especially the Spanish infantry, still kept up somewhat of the fame of the man who had created it, the great Gonsalvo (erroneously called Gaspar in p. 39) of Cordova.

In France, on the contrary, with much less influence abroad, we can see all the germs of a fresh and prosperous development. In 1598, the revenue of 9,000,000 crowns (19,000,000 thalers) just balanced the expenditure, and was capable of considerable expansion. Absolutism was still kept in check by the provincial estates, the municipal liberties, the (judicial) parliaments, above all by the separation of the religious confessions. In France, as in Germany, neither of the two parties had succumbed to the other. The Reformed party had put their leader on the throne—not however till he had (at least outwardly) conformed to the creed of the opposite side. Yet by inclination as well as through necessity he always paid every possible consideration to his oldest and truest friends, and the Reformed were protected by widely extended privileges against the enmity of their foes, and any oppression by the royal officials. Besides such elements of resistance, the long wars had made rest a necessity, and created in the great majority of the nation a readiness to join the side of a prince who maintained order and security. All might be attained when a firm and skilful hand knew how to unite and employ the existing resources.

This was shown at once in the contest for the marquisate of Saluzzo, which our author has described in his second chapter with complete—almost too complete—detail. By the treaty of Vervins this little district was to have come to France. But the ambition of Charles Emanuel, Duke of Savoy, aimed at attaching it to his own house by all the devices of policy, and with the assistance of Spain—really against his own interest, which would have required him to obtain support in Italy against his mighty ally by means of France. The duke was able for a long time to protract the matter, by negotiations, and then by a visit to Paris. At last the king's patience was worn out, and on August 11, 1600, he declared war, the issue of which was rapid and decisive. Deprived of nearly half his dominions, and deserted by Spain, the duke had, on January 17, 1601, to submit to terms of peace. France, it is true, gave up the distant and isolated marquisate, but she received instead important possessions

of Savoy west of the Alps, the county of Bresse with 200,000 inhabitants instead of 25,000. The relations with Spain also became peaceful about the same time. Henri had already, in April 1600, sent Count Rochepot as ambassador to Madrid, and after the peace of Lyons the Spanish king, on May 27, 1601, brought himself to take the formal oath of peace. When a little later, in September 1601, the same week gave the Spanish king a daughter and the French king a son, Henri began to plan a marriage between them, which he hoped would give his son the Spanish Netherlands as his bride's dowry. The interesting negotiations on this point in the autumn of 1601 are published by Dr. Philippson for the first time from the despatches of the Spanish ambassador Tassis among the Simancas papers. Perrens' well-known work, *Les Mariages espagnols sous le Règne de Henri IV.*, thus receives a considerable supplement.

It was almost more difficult to maintain peace at home than abroad. What a hostile position the confessions still held towards each other! There were some men, endowed with a freer insight, who recommended toleration, freedom of conscience, and equalisation of rights between the two confessions. Henri's trusted minister, Sully, inclined to these views, and his co-religionists reproached him bitterly with addressing the pope as "Holy Father." The king, too, was indifferent as regards dogmatic distinctions, whether it was that he really had attained a clearer insight into the essential nature of religion, or that he was without the religious sense itself. In either case his manner of thinking was extremely advantageous to France. But what difficulties he encountered in carrying out his views among the Catholics, and no less among those who held his earlier faith! The Reformed, in fact, formed a state within the state. Only after long negotiations did they bring themselves to allow their governing body to be, to a certain extent, dependent on the king. These negotiations had been going on since 1596; at last the leaders of the Huguenots gave way, and Henri signed, April 15, 1598, at Nantes, the famous Edict.

Besides the religious opposition, there was also an aristocratic one—not dangerous through its own power, but only when leaning on foreign help. Already, during the war of Saluzzo, Savoy and Spain placed their main trust in Marshal Biron, who, after having been one of Henri's most zealous and useful servants, and holding the highest places of honour, dazzled by success, had been led on by a boundless ambition to make himself a tool of his sovereign's foes. While at the head of a French army in January 1601, he had concluded an agreement which even the Constable of Bourbon would have hardly brought himself to agree to. Marseilles was to belong to Spain, the French provinces were to be separated from each other as independent districts, except that they (like the German princes) might choose an "over-lord." As his reward Biron was to have a relation of the Spanish king as his wife, with a rich dowry, and the duchy of Burgundy as hereditary in his family. However wild these plans sound, yet this danger lay in them for Henri, that Biron succeeded in uniting himself with all the other elements of opposition. Discontented Catholics who could not forgive the king the Edict of Nantes, the Reformed whom his conversion had displeased, great nobles who could not forget their previous state of independence, and besides these a great personal following, attached themselves to Biron. In addition to this, a new tax had caused great discontents and even disturbances in some of the southern provinces. Of all these circumstances the restless, ambitious viceroy of Milan, the Duke of Fuentes, hoped to avail himself, to strike a great blow against France, which would compensate Spain for her ill-success against England and Algiers.

Henri himself was not free from anxiety. He tried to win back Biron by entrusting him with the government of Guienne, and with important embassies to Switzerland and England. In London (according to De Thou, Sully, and other contemporary writers), Queen Elizabeth showed the former favourite of the French king from a window of the Tower the head of her own former favourite, Essex, whom she had beheaded just before. "If the king, my brother" (she added), "followed my advice, the heads of the factious and rebellious should soon be placed on the gates of Paris as a terrible warning, just as now on those of London." This story about the head of Essex does not seem to me so trustworthy as it does to the author. Camden, in his *Annals of Queen Elizabeth* (Leyden, 1649, iv. 822), says expressly that Essex' head was buried with his body; he confirms, however, the account of the words which Elizabeth made use of to Biron. In any case the marshal neglected this last warning also, and Henri was forced to take extreme measures. Now, however, it became clear how the monarchy had gained in power. The king had only to appear, and the contumacious provinces became obedient. The great men tried to escape by flight or submission. Biron, deserted by his followers, betrayed by his confidants, dared not refuse to obey the king's summons to the court. He reached Fontainebleau June 12, two days afterwards he was apprehended, and on July 31, 1602, executed in the court of the Bastille.

Dr. Philippson has traced all the threads of this remarkable conspiracy, and been able, with the help of MS. materials, to bring much that is new to light. A special excursus at the end of the work gives a full account of the sources of information. He judges the marshal—I think rightly—with more severity than Ranke has done, and brings out clearly the absurd, immoral character of Biron's scheme. Henri has been much blamed for letting the sentence against Biron be executed. We may doubt, indeed, whether greater tenderness towards one who had been such a zealous and deserving follower would not have done honour to his character, but his severity proved highly beneficial to his government. After Biron's fall opposition ceased; for the first time Henri found himself in full and undisturbed possession of his dignity and power.

The fourth and last chapter of this volume begins therefore most appropriately with well executed characters of the king and his leading ministers. As the chief among them appears Maximilian de Bethune, Marquis de Rosny, better known under his later title as Duke of Sully. In his lifetime much hated and reviled, he has been compensated for this since his death, in our author's judgment, more than is his due. He provided carefully for his own fame by his well-known book, the *Oeconomies royales*, which down to the present time (by Poirson, Lacombe, and others) has been used as a trustworthy authority of the highest value. But Dr. Philippson shows by many examples (pp. 235, 325, 363) how often his self-love has led the duke into inaccuracies and even into manifest falsifications, and how untrustworthy in general his assertions are. A Munich scholar, Dr. Ritter, has lately shown (*Abhandl. der bayrischen Academie der Wissenschaften*, III. Classe, XI. Band, III. Abtheilung) in a special treatise that even the so-called "great plan" ascribed to Henri, viz. the formation of a European commonwealth of states, must be regarded as an invention of Sully's own.

The rest of the chapter is devoted to the political development of our part of the world in the three following years, and especially to the relations between France and Spain. The author has, not unfairly, given it the title of "the hollow peace." Both states still shrunk from an open declaration of war. Henri thought the time not yet favourable; he

therefore rejected Elizabeth's repeated proposals for an alliance against Spain, and resumed in November 1602 the old plans for the marriage; the Spaniards tried a little later, through the intermediation of the pope, to establish friendly relations with him. But secretly both continued to work against each other, without being by any means particular in the choice of means. Even during the peace Henry did not hesitate to favour plans for a sudden attack on the fortress of Pampeluna, and when the monks had convinced the pious king of Spain that he might (in the interest of religion and his crown) unite himself, contrary to his oath, with rebellious Huguenots against Henri, even the "Most Christian" king did not hesitate, in order to injure the house of Habsburg, to stir up the Turks, whether against Hungary or against Spain. For years he was even connected with Philip's Mahomedan subjects, the Moriscoes, who, driven to despair by intolerable oppression, gladly took the opportunity to unite themselves with the enemy of Spain for vengeance and revolt. On this Dr. Philippson communicates new information of great interest, taken from the memoranda of the governor of Bearn, the Duke of La Force. The insurrection which was to have begun with the burning of Valencia was just ready to break out when the Spaniards, warned in time by their spies, quenched it in the blood of its leaders. Bribery and espionage were then the most favourite means of political skill. The Spaniards had even succeeded in gaining over the trusted secretary of the French minister of foreign affairs, the Marquis of Villeroi. This man, Nicolas l'Hoste, betrayed the most important despatches to the Spaniards, so that the instructions for the French ambassadors usually came to Lerma's knowledge before they did to that of the persons to whom they were addressed. This game lasted several years, till at length (May 1604) it was betrayed by another spy. L'Hoste was drowned in the Marne in trying to fly, and the French had to content themselves with tearing his body into pieces by four horses on the Place de la Grève.

We cannot follow our author in detail through his representation of the struggle between French and Spanish influence in the most different regions—in Switzerland, Italy, England, Germany, as also in the East. Once only the Spaniards had the advantage. In especial it was an inestimable gain when the death of Elizabeth in 1603 rid them of their most dangerous foe, and they could enter into friendly relations with her successor, King James. But in most cases they failed against the strong and skilful policy of the French king. In Italy the Duke of Savoy passed over to Henri's side, especially after the attempt to master Geneva by a night attack had failed (Dec. 22, 1602). Even in the conclave which followed the death of Clement VIII. French influence proved superior to that of Spain. The Cardinal of Medici, nearly related to the Queen of France, ascended the papal throne under the name of Leo XI., April 1, 1605. He died twenty-seven days after, but his successor, Camillo Borghese, raised to be pope, May 16, under the name of Paul V., was also more favourable to the French than to the Spaniards. With these events, and the relations of England to France and Spain, the first volume of this useful and attractive book comes to an end. We shall await the next with lively interest.

HERMANN HÜFFER.

A Translation of that Portion of Domesday Book which relates to Lincolnshire and Rutlandshire. By Charles Gowen Smith. Simpkin, Marshall, and Co.

VERY much will have to be done ere the Conqueror's Survey becomes as intelligible to students as we should wish it to

be, but that labour will, it is probable, take the form of commentary, not of translation. A very slight knowledge of Latin qualifies any one who possesses Robert Kelham's *Domesday Book Illustrated* for turning the record into English in such a manner as to satisfy most people who are not acquainted with the original, but it requires a combination of qualities such as are very rarely found, if indeed they have ever been found at all, to justify a man in undertaking the task of presenting a document so bristling with difficulties in a translated form. Mr. Smith is not the first person who has attempted to turn the Lincolnshire portion of Domesday into the vernacular. William Bawdwen, a Yorkshire clergyman, vicar of Hooton-Pagnell, published at Doncaster, in 1809, a translation of the *Dom Boc* for the counties of York, Derby, Nottingham, Rutland, and Lincoln. He was a good mediæval scholar and a conscientious workman who availed himself to the utmost of the lights furnished by the elder antiquaries. As a translation we do not think any one at the present day could greatly surpass it, but it is devoid of notes, and the glossary is thin, poor, and inaccurate. Bawdwen had probably no personal knowledge of Lincolnshire. If he had known the county, he could not have been so much at fault as he constantly was in his identification of the Domesday villages with those to be found on the modern map.

Mr. Smith's translation differs but slightly from the elder one, the variations indeed are so very few that it is obvious, though he does not tell us of it, that Bawdwen's version is the basis on which his has been constructed.

Where differences do occur, Mr. Smith is almost always in the wrong, e.g. in the second line of the *Terra Regis* we find, "T'ra ad iiii car'," that is, *Terra ad quatuor carucas*. Bawdwen renders this correctly, "Land to four ploughs," but Mr. Smith turns it into "The land is four carucates," and that this is not an accidental slip is proved by his translating, under Netelham, *Terra ad xvj carucas*, "The arable land is sixteen carucates." In fact, this confusion between *caruca*, a plough, and *carucata*, a carucate or carve of plough land, runs through almost every page of the volume.

The practice of introducing explanatory words which are not in the text, as "arable" in the sentence last quoted, is highly reprehensible in all translations, except where the words so added are marked by brackets or a different form of letter; it is fatal in a book of this kind which, to have any value, must faithfully represent the minute peculiarities of the original.

The introduction deals with many subjects where we cannot at present follow the author, but a few words must be said concerning Mr. Smith's strange theory as to the derivation of the names of Lincolnshire towns and villages. He believes, in opposition to every competent person who has studied the subject, that they are all, not Teutonic, but Keltic.

"They are popularly, but very erroneously, supposed to have been to a great extent of Scandinavian origin. They are not Saxon or even Saxonized, but were fixed long before the terms Saxon or Danish appear as national denominations in the page of history."

Such is Mr. Smith's conclusion, and he supports it by an array of derivations which show that the late Mr. Godfrey Higgins, who, along with many other far more foolish guesses, suggested that Brimham, near Ripon, was derived from the Hebrew Beth-Rimmon, has still left a follower who is prepared to go all lengths in support of the exploded dreams of Kelticism. He tells us that Castlethorpe, a hamlet near Brigg, which almost certainly took its name from an earthwork there, is *Ka-see torp*, "great mere or marsh village"; that Cameringham, which is named after a Teutonic mark, and has a sister

village called Cammerton, in Cumberland (Kemble, *Saxons in Eng.* i. 460), is *Ka-mas lynn ðm*, "principal mounds upon a lake-holm."

That Mr. Smith should reject the legend of the mythic Grim, the founder of Grimsby, is not surprising, though his effigy still does duty on the ancient seal of the borough, but it is really wonderful that the termination *by* does not convince him that, even if the Grim who has got into the local histories be as unhistorical as Pharamond, still the place must have been called after some man or woman so named. The law of the formation of names such as this is so well known now that the very strongest evidence must be forthcoming before it is admitted that a place in those parts of Europe where the Norwegians had settlements, whose termination is in *by*, is not in its earlier part composed of a patronymic. But the evidence here is all the other way. Grimsbury, Grimstead, Grimston, and Grimsthorpe are sister names in England, and Grimstad in Norway, Grimsay in the Hebrides, Grimmen in Pomerania, and Grimberghen in South Brabant are most probably foreign relatives. The personal name Grim seems, too, to have been very common; a hunt among indexes would furnish scores between the sixth and the eleventh century. Jarl Grim flourished in England *circa* 950. There were coiners so named at Lincoln, Thetford, and Shrewsbury. Edward Grim was a monk who was present when St. Thomas of Canterbury was murdered. In the reign of John, Simon Grim, who had a ship also called Grim, flourished at Hythe, and in 893 Angelric, a priest of Vasnau, married a woman called Grimma; yet, notwithstanding all this, and the constant tradition of the place from an early period, Mr. Smith tells us, without doubt or hesitation, that Grimsby is *Grimas-buy*, "an abode at the sacred mounds."

The writer's belief in the Druids and Keltic matters generally has fortunately preserved him from discovering a shred of the Raven banners of the sea-kings in the name of the little hamlet of Raventhorpe. It would really have been a pardonable lapse into poetry if he had found here a memorial of the time when Witikind the sea rover

"enter'd the Humber in fearful hour  
And disembark'd with his Danish power,"

especially as there is within a few miles a village, just on the Humber shore, called Whitton, which might have been made to do duty so admirably for Witikindton. He is true, however, to his theory, and gives us for Raventhorpe *Ra-avon torp*, "an elevated river-village." This is particularly unfortunate, as there is no river there, and the place is, and always has been, below the hill. There is no excuse whatever for trifling such as this, for the old name of the place, *Ragenaltorp*, as given in Domesday, carries its derivation on its face.

Bottesford is a name that there is good authority for blundering over. Abraham de la Pryme, more than a century and a half ago, made a guess that it meant the town of apples. This we always thought was as far away from the truth as it was possible to go, but Mr. Smith, who makes of it *Bô-dhal cee forde*, "the curved hill altar of a marsh township," has surpassed the Yorkshire antiquary, for apples do grow there still, but "horse-shoe shaped mound of worship" there is none, and, we may safely affirm, has never been. The meaning of the name is obscure, and the Domesday spelling *Budlesforde* does not help us. It may be from a patronymic, but it is more probable that the spelling *Botelford* (Testa de Nevil, p. 344) preserves the earliest form, and that the first syllable is *Bôtel*, the Anglo-Saxon for a dwelling, to be found in north country names, such as Newbottle and Harbottle.

Statements are continually made in this book without the

slightest reference to authority. For instance, we are told in one place that

"Learning and the alphabetical character, which first made the Anglish a vehicle of written literature was imported from Ireland" (xlv);

and in another that the Lagmen were "lawyers or lesser thanes" (p. 266). We really ought not to be put off with half knowledge. It is too bad not to inform us whether these lawyers were solicitors or only attorneys. It is not improbable this mistake has arisen from an attempt to translate *Homo legalis*—an expression almost certain to be found in any glossary which explains the word. In the introduction we are told that *Glentenwide* is the old name for Glanford Briggs, otherwise Brigg—a piece of information which is quite new.

In almost every particular this book is much inferior to its predecessor. It is but fair to point out, however, that in some instances Mr. Smith has been able to identify places which escaped the industry of Bawdwen.

EDWARD PEACOCK.

### Intelligence.

Mr. Edward A. Freeman, the historian, whose excellent works are highly appreciated by competent German scholars, has been travelling lately in Germany with the purpose of studying the history and architecture of the early (chiefly Romanesque) minsters and churches. The route he has been taking, from Aachen and Köln up the Rhine, his visits to Loesch, Gelnhausen, and Fulda, to Marburg and Limburg on the Lahn, will soon be traced in a new series of his well-known contributions to a weekly paper.

Many complaints have been made for several years past of the slow progress and deficient editorship of the *Monumenta Germaniae Historica* as well in the public press as more suitably by certain prominent historians. In consequence of a recent resolution of the Reichstag, further means for continuing this magnificent collection of materials for the national history are only granted under the express condition that, beginning with the year 1873, the direction of the work and the issue of its parts shall henceforth be under the superintendence of the Royal Academy of Sciences at Berlin. The great age of Dr. Pertz makes the substitution of a new editor-in-chief very desirable, and rumour, indeed, hints pretty distinctly that Professor Waitz, in Göttingen, will be the successor at a not very remote period. Nevertheless Dr. Pertz writes to the papers protesting that, unbent by the burden of seventy-seven years, and free from any illness whatever, he continues his daily labours as he has been accustomed to do for the last fifty years. In fact, a new volume, the first of the third sub-division, of which nothing had been heard since the publication of the plan in 1824, a volume containing the *Diplomata and Charters* of the early kings and emperors, edited by Dr. Carl Pertz, is just leaving the press, and is expected to give rise in a more than usual degree to controversy among the small learned fraternity who really know how to edit charters.

On the 9th of July the statue of the great Baron Stein, erected most picturesquely amongst the ruins of the castle of his ancestors near Nassau, on the Lahn, was inaugurated in the presence of the German Emperor, the Empress, the Crown Prince, and a very select circle of distinguished politicians and patriots. Stein, when Prussian minister in 1807 and 1808, was the reviver of the almost forgotten principles of German self-government. After having had the honour of being personally outlawed by the first Napoleon, he returned under the victorious colours of the Allies in 1812 with the plan of a truly national reconstruction of Germany. It was he, too, who started the scheme of publishing the *Monumenta Germaniae Historica* in 1819, and in 1823 placed Dr. Pertz at the head of the editing staff. The presence of the latter at the inauguration of the statue of the great baron, whose very substantial biography he published about twenty years ago, was appropriate, and would have been highly grateful to the original.

The *Memoirs of the late Baron Stockmar*, which have just been issued by the firm of Vieweg, in Brunswick, selected and most carefully edited by his eldest son, cannot fail to meet with very many eager readers both in Germany and in England. Though the most intimate relations by which Baron Stockmar was attached to the late king of the Belgians, and to Queen Victoria and the Prince Consort, as well as to some of the leading statesmen of the time in the several countries, are more or less indistinctly known, the public at large has hardly ever been informed of so much sterling wisdom and goodness as was to be found in this extraordinary and most unpretending man. While he shunned on principle every unconstitutional influence whatever, he became the oracle of the highest, the worthiest, and the most intelligent of his

contemporaries. From the Greek candidatureship of Leopold and the erection of the Belgian kingdom onward to the marriage of Queen Victoria, to the Spanish marriages which lost Louis-Philippe his crown, the Frankfurt diet in 1848, and the regency of the present king of Prussia and emperor of Germany in 1858, the readers will be fascinated by many a disclosure from the most authentic papers and memoranda. They are printed more or less in full, and form the chief contents of the present volume, which, as we are told, will soon appear in an English translation, edited by a rising diplomatist, Mr. J. D. B. Morier.

The fierce struggle which has broken out at last between the central government of the German Empire and Roman Ultramontanism is calling forth a great number of books and pamphlets on either side. Whoever wishes to inform himself thoroughly of the present state of the law regarding the limits of Church and State, and about the literary and historical materials in detail, will find the most complete collection of information in the new (the seventh) edition of Richter's *Lehrbuch des katholischen und evangelischen Kirchenrechts*, the work of Dr. R. W. Dove, professor of canon law in the university of Göttingen. In the chapters which treat of the pope and papal government of bishops and priests, councils and synods, all results of the decrees of the last Oecumenical Council are drawn out with masterly clearness.

### Philology.

*Miscellaneous Writings of John Conington*. Longmans.

THE editor of these two beautifully printed volumes says in his preface, with truth and justice, that "the reputation of Professor Conington as a scholar will rest upon his editions of the *Choephore* and of the works of Virgil and of Persius. As a translator he will continue to be known by his verse-renderings of Horace, of the *Aeneid* and of the *Agamemnon*. In the *Miscellanies* now offered to the public he appears both as a scholar and a translator; but their distinctive mark is what, for want of a better phrase, may be styled literary versatility." The collection is indeed of a very miscellaneous nature; many of the articles are of distinguished excellence, and will have an abiding value; a few were written to serve a temporary purpose, and in all likelihood would never have been reprinted by the author himself. And yet the very slightest among them has a certain interest, and is so characteristic of the writer that there is not one of them which we should have liked to have seen rejected by their judicious editor.

The well-written memoir of the author by his friend, Professor H. J. S. Smith, prefixed to the volumes, tells the uneventful story of his life in a few pages concisely, but effectively. At the end of this memoir there follow about twenty pages of extracts from his letters, addressed almost entirely to a few of his younger friends and pupils, in which his modest and affectionate, yet acutely critical and scrupulously truthful, character is displayed to great advantage.

Conington's own contributions are headed by the essay on Pope, the longest in the whole collection, and one of the

most elaborate. The works of the poet, including the translation of Homer, are successively passed in review, and their merits and defects are dissected in a manner worthy of the editor of Virgil and the accomplished verse-writer and translator. He admires Pope, but not blindly, and with many reservations. If his estimate of the poet be on the whole higher than the average critical judgment of the day would be likely to sanction, at least if we may draw any inference from the poet's latest commentator, he never for a moment permits it to interfere with his perception of the transcendent merits of the older writers, "who have achieved triumphs of expression to which he was unequal, and struck chords of melody of which he never dreamed." The whole of the essay is marked by great moderation: to us the most interesting portions of it are the earlier pages, in which he discusses with much critical acumen the question of Pope's correctness, examines its quality, and points out in what sense Pope may be said to be a more correct writer than Shakespeare, for instance, or Spenser.

This first dissertation is followed by two popular lectures on *Lear* and *Hamlet*. If the preceding essay may be looked upon as showing the Virgilian side of Conington's mind, these two may be taken to represent its Aeschylean phase. It is more than probable that the author, always disposed to mistrust his own powers on ground which he had not by long pondering fully made his own, would not have thought of publishing these himself. We are however glad to have them. Of the two lectures the one on *King Lear* appears to us far the freshest and most original and best. It is curious and instructive to see how the writer sets himself to dissect the play as if it were the *Agamemnon* or *Choephore* of his own *Aeschylus*. Overpowered by the transcendent energy of the poet, he will see in him no flaw or weakness; will justify what many of Shakespeare's greatest admirers would only consent to excuse as concessions to the roughness of his times and his audience, for whose iron nerves no excitement was too strong. "It was necessary, in order to fill to the full our conception of Lear's sufferings, that we should know of what fiendish cruelty his enemies are capable; and this is impressed on us far less vividly when we simply hear that they have laid a plot against his life than when we actually see a venerable nobleman, who has rescued him from them, bound in his chair in his own castle and having his eyes torn out by the duke's hand. Thus we may feel that Shakespeare has really exercised forbearance and consulted how to spare the sensibilities of the spectator or the reader: he has not shown us the father actually exposed to the white heat of his children's hatred, but has left us to estimate its intensity for ourselves from the manner in which they deal with his preserver." Whether this unqualified defiance of Horace's laws of scenic propriety can be accepted in the present case, we dare not offer an opinion. The analysis, however, of the whole play is exceedingly suggestive and interesting, much more so, we think, than the equally elaborate, but less original, examination of *Hamlet*. His self-reliance seems not unnaturally to have somewhat failed him here; and he has been content to lean more on adventitious assistance in his dissection of the problems presented by this most famous of all tragedies.

The two lectures on Shakespeare are followed by a very long paper on "the English translators of Virgil;" in which almost every version from the sixteenth to the nineteenth century is brought under review and weighed against its competing rivals. This was a subject of which Conington never tired, as was natural enough in so great a translator as he was himself. We fear we have not the requisite tastes and qualifications to enjoy as we ought this elaborate disquisition.

After this comes a series of six papers on Latin poetry in its various stages, which, as the editor justly observes, "will appear the most important section of the work," or rather, we should say, of the first volume. In these papers the whole field of Latin poetry is surveyed from Ennius to the silver age with much discrimination and much critical power. We have here in fact the results of what formed the main occupation of the maturest period of his life. The eloquent upholder of the supreme excellence of the Augustan poets, he at the same time does more than justice to the fragments of the early Roman tragedy, and on the whole metes out to Ennius his full share of praise. On the other hand, he scarcely appears to us to give the silver age its due in his two articles on Statius and Seneca. Surely the style of Martial is of as consummate a finish as that of Terence or Virgil. One of these essays, "The Style of Lucretius and Catullus," nearly forty pages in length, is a very full examination of a few sentences, not amounting to a page in all, in which the writer of the present notice had made some remarks on the preceding article, "Review of Munro's Lucretius." This is not the occasion for him to enter into a fuller exposition of what he now thinks on the subject: he will content himself with acknowledging how much he has learnt from the masterly criticism of this paper, and how deeply he feels the generous kindness with which he has been treated throughout.

In the lecture on the "Academical Study of Latin" we find in pp. 216-220 some very suggestive arguments on the advantages of the mental discipline to be gained by studying the classical languages. The whole of this essay is well worth pondering over at the present time, when the Latin writers are so bitterly assailed in so many authoritative quarters; when Mommsen, who has a more comprehensive acquaintance with the whole field of Roman antiquity than any other living writer, appears to find his highest enjoyment in pouring contumely on the heads of Cicero, the great representative of classicism, and of the two "court poets," Virgil and Horace. Hear what Conington says in pp. 207, 208:

"In speaking of Roman literature as imitative, it must not be forgotten that the reproach is not peculiar to it, but attaches to the whole of the literature of modern Europe. Greece, in its independent, instinctive development, set the example which subsequent nations have followed with more or less of distinctive consciousness. Even if we choose to consider this conscious effort after an external standard as fatal alike to national and individual genius, we must admit it to be an inevitable evil, involved in the very position of those who have a preceding civilisation to reflect upon. Rome may seem to have been more of a copyist than any of its successors, partly as being actually more indebted to Greece, partly from the lateness of its intellectual growth, which suggests the notion of rational deliberation rather than of creative energy; but the difference must not be exaggerated in either case. If modern nations have followed Greece less closely than Rome did, it is attributable to the fact, among other causes, that they have had Rome as well as Greece to follow; nor will the long barrenness of the Roman intellect prejudice the judgment of those who bear in mind that the Punic wars were in the life of the Eternal City only what the war with Persia was in the briefer history of Athens, and that even now the true literature of modern Germany, though one of the richest that Europe can boast, is scarcely more than a century old."

It is well to take these sentences, and indeed the whole essay, to heart, when one hears on all sides baseless talk of some "lingua rustica" spoken by the people, as different from the language of literature apparently as Italian is from the style of Cicero. As if the "lingua rustica" of the people of Rome and Latium was not nearer the language of Plautus and Terence, of Cicero and Caesar, than the "lingua rustica" of Boeotia was to that of Pindar, of Attica to that of Sophocles and Plato, or of England to that of Burke and Macaulay. We lately heard an eloquent historian refer to the sarcasm of Naevius on the Metelli as representing the

people's language in contradistinction to the exotic styles of the Ciceronian and Augustan periods. As if "Fato Metelli Romae fiunt consules" was less borrowed from Greek models, less removed from popular apprehension, than "Romanos rerum dominos gentemque togatam"; as if the babble of Prudentius was not the bald imitation of imitations of the ages of Virgil and Seneca. But we have no space here to dilate further on this topic.

The two final papers in the first volume are reviews of Bishop Forbes' liturgical writings, and give an interesting picture of Conington's theological investigations, but above all of that noble candour and consistent courtesy which never seem to have failed him once in all that he wrote or thought.

The prose translation of Virgil, which occupies nearly the whole of the second volume, will be found to be a quite indispensable supplement to his edition of the poet's works. We do not hesitate to say that the translation of nearly every verse is more or less a commentary on that verse. The author had satisfied his literary feeling by his verse translation, and this prose one would appear to have been designed more for a commentary than a specimen of literary style and finish. Manifestly, too, as the editor remarks, it is in an unfinished state. This applies especially to the *Eclogues* and *Georgics*, and perhaps, though in a less degree, to the earlier books of the *Aeneid*. The later books we have read through with undiluted pleasure and admiration, and we look upon them as a magnificent contribution to the elucidation of the poet's many difficulties. But this we would say of the earlier portions as well: even where we are disposed to dissent, we pause, reflect, and are edified. As a proof that in the earlier parts we have not always the translator's most matured views, we would refer to vv. 31-40 of the sixth Eclogue, where it will be seen that the translation is in harmony with the notes to the first edition, but differs essentially from those of the second. In these portions of his work, much oftener than in the latter, we find him making experiments as to how he can compensate in English for the far greater power the Latin possesses in giving emphasis by the position of the words in a sentence. Thus we have, Eclogue v. 22, 23, "Cum complexa sui corpus miserabile nati Atque deos atque astra vocat crudelia mater," translated, "When his mother, clasping her son's piteous corpse, is crying out on the cruelty of the gods and stars, as only a mother can"; Eclogue vi. 1, 2, "Prima Syracosio dignata est ludere versu Nostra nec erubuit silvas habitare Thalia"; "First of all, my muse deigned to disport herself in the strains of pastoral Syracuse, and disdained not to make her home in the woods, goddess as she was." In Eclogue vii. 62, he thinks he must give point to "formosae Veneri," and translates, "Venus, beauty's queen"; and this makes him reproduce "Lycida formose" in v. 67 by "Lycidas, beauty's king," whereas these words of Thyrsis really answer to Corydon's "formosus Alexis" of v. 55, which is translated simply, "our lovely Alexis." Sometimes he would seem to accentuate overmuch the plain language of the poet: thus, Eclogue v. 54, "Et puer ipse fuit cantari dignus, et ista Iampridem Stimicon laudavit carmina nobis," is translated, "That glorious boy was a theme worthy of any one's song, and Stimicon ere now has dwelt to me with rapture on those strains of yours." He is often eminently successful in bringing out the full point and force of a metaphorical expression. Occasionally, however, in these earlier portions we find a metaphor ridden too hard, as in *Georgic*, iii. 180, "Aut Alpheia rotis praelabi flumina Pisae," "or to glide at Pisa by Alpheus' waters on wheels smooth as they." Surely the rattling and jolting of the wheels of a springless car over the hard-paved Hippodrome of Olympia must have resembled

as little as possible the smooth flow of a river. Again, *Georgic*, iv. 518, "Arvaque Rhipaeis numquam viduata pruinis," is thus reproduced, "And fields whose marriage-bond with Rhipaeian frost is never severed." Surely "never widowed of Rhipaeian frost" would be sufficient here. Yet in every one of these instances, even where we do not approve, we find instruction and food for reflexion; and the inner sense of Virgil is brought more distinctly before the mind.

H. A. J. MUNRO.

T. Macci Plauti Trinummi. With Notes Critical and Exegetical. By Wilhelm Wagner, Ph.D., Editor of the *Aulularia* and of Terence. Cambridge: Bell and Daldy.

ENGLISH scholars who desire to gain an insight into the present state of the textual and metrical criticism of Plautus and Terence owe a debt of gratitude to Dr. Wagner, whose editions have done more than any other books written in English to put the questions at issue in a clear light, and to illustrate them with candid and sensible discussion. It is with great pleasure therefore that we read in the first lines of the preface to the little book before us that Dr. Wagner determined three years ago to prepare a complete edition of Plautus with English notes, of which the *Trinummi* is an instalment. Unless we except the late Professor Ramsay's unfortunately unfinished edition of the *Mostellaria*, English scholarship has of late been unfairly neglectful of Plautus, nor is any scholar more competent than Dr. Wagner to make good the defect.

The *Trinummi* now before us does not apparently aspire to the completeness of the editor's *Aulularia*: but, especially for schools, it will be found a very valuable book. Teachers in schools are generally thrown back upon Lindemann's three plays (*Captivi*, *Trinummi*, and *Miles Gloriosus*) of 1844, the commentary of which, though really serviceable in matters of interpretation, and perhaps not always sufficiently regarded by Dr. Wagner, is, in all points in which Plautine scholarship has really advanced during the last thirty years, far behind the time. As the *Trinummi* is a good deal read in English schools, we hope that this edition of Dr. Wagner will receive the attention which it deserves. If so, it will do much for the improvement of exact Latin scholarship.

The preface contains some brief discussions on various disputed points, and, among them, on our old friend the final *d* of the ablative and of adverbs, which, as the readers of the *Academy* are probably aware, Ritschl is inclined to introduce with some liberality into the text of Plautus for the sake of avoiding hiatus ("angina acerrume" for "angina acerrume," and so on). A great deal of learning has been expended in Germany upon this obscure and difficult point: it is not only in history that, as Hegel observed, "eben eine dunkle und trübe Zeit ein besonderer Gegenstand und Anspornung der Gelehrsamkeit ist." With the majority of scholars in Germany, Dr. Wagner is against Ritschl in this matter. He relies especially (preface, p. iv) on Corssen's argument given in his *Aussprache, Vokalismus*, &c., 2nd ed. pp. 1004-9. Corssen brings forward a crowd of instances in which Plautus and his contemporaries elide the ending of the ablative, or use the later form before consonants, and argues from them that the final *d* cannot have been pronounced in the conversational Latin of Plautus' time.

This, like many of Corssen's arguments, is weighty and sensible, and requires a thorough and candid consideration. But Corssen does not seem to us to have done justice to all the points of the question. (1) He assumes that in those cases, contemporary or nearly contemporary with Plautus, where final *d* was written, it was not pronounced: and, while

he grants that Plautus may sometimes have *written* a final *d* to avoid a hiatus, he thinks that the actor most probably never pronounced it. Surely a most unnatural supposition, especially in the case of a writer for the stage. It is true, of course (as Corssen urges), that English and French orthography is a very bad guide to English and French pronunciation; but this anomalous state of things was probably almost unknown to the earlier worthies of Roman literature. Corssen does not, it seems to us, take sufficient account of the possibilities of different usages and different pronunciations in the common Latin of the time of Plautus. An instance from English literature will clearly illustrate our meaning. The third person singular of verbs in Shakespeare (except in the case of *hath* and *doth*) commonly ends in *s*: but Shakespeare will sometimes, for the sake of the metre, use the older ending in *th*.\* Now supposing that the MSS. of Shakespeare were as far removed from the time of the poet, and gave as distorted a view of his real text, as those of Plautus: supposing that in the text, so mutilated, we found lines which only required an additional syllable to a verb in the third person singular to make them scan: supposing that our knowledge of Elizabethan grammar (outside of the text of Shakespeare) were only supported by a few state-documents contemporary with the poet, and a few fragments of contemporary literature: supposing that these documents and fragments gave us instances of verbs making their third persons singular in *th*, and that the MSS. of Shakespeare commonly presented *hath* and *doth*: in such a case an editor of Shakespeare who should endeavour to restore his metre, where possible, by the introduction of the ending *th*, even though the MSS. seemed occasionally to support him in the case of polysyllabic words, and almost invariably did so in the case of *hath* and *doth*, would probably be considered rash by the majority of contemporary critics; but he would, on the whole, have the right on his side. Now it is certain that in other analogous cases of grammatical usage Plautus did allow himself a variety analogous to that which we have pointed out in Shakespeare: he wrote (and surely pronounced) *postid* as well as *post*, *antidea* as well as *antea*, *med* and *ted* as well as *me* and *te*: why then should we judge of his usage with regard to the ablative by one set of instances alone? (2) Corssen attributes, as we think, too much weight to the authority of MSS. which, in the case of Plautus, an old writer and a writer for the stage, cannot surely be rated as high as that of contemporary inscriptions. However scanty the remains of the latter may be, Ritschl is right in pressing the evidence which they afford with emphasis into his service.

The notes are as a rule good, and contain a great deal of information. Something more might however, we think, have been done towards the illustration of the syntax and language of Plautus. There is no notice, for instance, of the tenses in v. 115, "*haec, si mi inimicus esset, credo, haud crederet*," where *fuisse* and *credidisset* would have been expected; *of fuerat* for *fuisse* in the phrase "*aequius fuerat*," vv. 119, 1038; *of "deum me atque hominum pudet,"* v. 912; *of "bene dicere homini amico, male loqui absenti amico,"* vv. 924, 926.

In a few cases, we venture to think a better interpretation might have been given than the one which the editor has adopted. In v. 345, "*pol pudere quam pigere praestat totidem litteris*," we should prefer to take "*totidem litteris*," not as = "though these words have the same number of letters," but as = "by as many letters as the word contains." In v. 482, "*honore populi*" surely means a "public office."

\* *Romeo and Juliet*, act i. sc. 4—"She comes, In shape no bigger than an agate-stone;" and so on for some twenty-eight lines: but then, "Sometime she driveth o'er a soldier's neck," &c.

There is much more humour in making the *slave* say, "I will make way for him in everything, get out of his way when he is walking, not stand in his way in the competition for public offices," than in making him say, "I will yield to him in all things which concern the outward show of respect due to a free citizen;" how indeed could *honor populi* express the latter? In v. 1049, *probant* hardly = *existunt*, but *aestumant*, as in Pers. 2, 2, 30, where nearly the same words occur. On v. 408, "*holitores myropolae aucupes: confit cito*," Dr. Wagner remarks, "is it not strange that the *μυροπώλης* should be mentioned with the greengrocer and poulterer?" It is possible that Plautus may have had in his eye the custom of using unguents as oil for herbs (comp. the proverb *τὸ ἐπὶ τῇ φακῇ μύρον*), which is known to have existed among persons of vulgar and extravagant tastes. In v. 526, "*vinum pendet putidum*" might have been well illustrated by "*pendens vinum*" in Cato, *R. R.* 147.

We conclude by offering one or two emendations. V. 368 as given by the MSS. gives no sense: "*sapienti aetas condimentum sapiens aetati cibust*." We would suggest that the words represent a proverb put into an iambic *octonarius*, wrongly introduced into the trochaic passage in which it now occurs, though good enough in itself:—

"*sapientiae aetas condimentum, sapientis aetati cibus*."

In v. 644, "*atque honori posterorum tuorum ut vindex fieres*," little or nothing can be made of *vindex*, unless the line be taken in connection not with what precedes, but with what follows: "*tibi paterque avosque facilem fecit et planam viam*." If with Dr. Wagner we join it with what precedes, *vindex* surely requires alteration. Is it possible that the word is a corruption of *δνειδος*? We leave the decision to critics more thoroughly acquainted with Plautus' use of Greek words than ourselves. In v. 749 the MSS. give either "*ut*" or "*ipsum* adeam Lesbonicum edoceam," &c. Dr. Wagner adopts Bothe's emendation, "*ipsum adeas Lesbonicum edoctum*." "*Ipsium adeo edoceas Lesbonicum*" would be an easy correction. H. NETTLESHIP.

#### MARKHAM'S TRANSLATION OF OLLANTA.

##### TO THE EDITOR OF THE ACADEMY.

SIR,—There are a few points in the review of my version of *Ollanta*, that appeared in the last number of the *Academy*, the explanation of which will perhaps dispel the doubts of the reviewer as to the antiquity of that drama.

1. He thinks that the line, "Therefore my ears grow longer," can only apply to an ass, and that consequently it must have been written after the introduction of Spanish animals into Peru. But the *atoc* in the neighbourhood of Cuzco has long ears, and the two lines,

"Therefore my nose scents better,  
Therefore my ears grow longer,"

are perfectly applicable to that animal. The introduction of *asnu* in the later versions is due to the blunder of a copyist.

2. The genitive *c, cca* is certainly archaic. It is never used in the country round Cuzco, and the old grammars prove that it never has been used for three centuries. If a Spanish priest had composed the drama, it is certain that he would have used *p, pa*. But the ancient genitive occurs in the old Ynca prayers preserved by Molina and Ynca Salcamayhua (MSS. at Madrid); which fact establishes the antiquity of the *c, cca* form of the genitive, and of any composition in which it occurs.

It is possible, but very improbable, that Dr. Valdez would have written a drama solely with a political object, and with the deliberate intention of excluding all allusions to religion. But it is not possible (and it was not necessary in writing for Indians in 1780) that he could have succeeded in absolutely excluding every Hispanicism, every foreign conception, and in using an ancient form of the former existence of which it is not probable that he was aware. The difficulties of such a

theory appear to me to be insurmountable, while the simple solution of the question, by supposing that he told the truth when he said that his work was taken down from the mouths of Indians, offers no such difficulties.

CLEMENTS R. MARKHAM.

### Intelligence.

It is now definitely announced that the last part of M. Littré's great Dictionary may be expected in November.

According to a Trieste paper, G. Corssen has ready for the press a work on the Etruscan language, which he maintains to be a purely Italian idiom, akin to Latin, Umbrian, and Oscan, and perfectly regular in its pronunciation and constructions. He has translated the Etruscan inscriptions in accordance with this view. His work is advertised in the last *Mittheilungen* of Herr Teubner.

### Contents of the Journals.

**The Indian Antiquary**, ed. by J. Burgess; part vi. (Bombay, June).—The Muharram; a Shiah house of mourning in Madras; by C. E. Gover. [A brief description of the Shiah anniversary of the death of the Imāms at Kerbelā, as witnessed at Madras. During the ten days the feast lasts, water and sherbet are freely offered to any thirsty passer-by; as the Imāms, being cut off from the Euphrates for three days, were greatly tortured by thirst. The ceremony consists chiefly in chanting songs on Husain; Ali Akbar, his eldest son; and Abbas, his brother, and their deeds and sufferings at the battle of Kerbelā.]—Folk-lore of Orissa; by J. Beames. [The writer thinks that, owing to the isolation in which their country has remained for so many ages, the peasantry of Orissa have retained old ideas and superstitions to a greater extent than any other Aryan people of India. The present paper treats of witches (including a *mantra*, or spell, in Uriyā) and similar superstitions.]—Bengali Folk-lore; by G. H. Damant. [Continuation; two other stories.]—On the Rāmāyana; by Prof. A. Weber. Translated from the German by the Rev. D. C. Boyd. [Continued. Prof. Weber endeavours to show that, in consequence of the mutual relations which Alexander's expedition into India brought about, between the inhabitants of that country and the Greeks, some kind of knowledge of the story underlying the *Iliad* found its way to India.]—On the Ancient Remains in the Krishna District. [From the Report of the late J. A. C. Boswell, Officiating Collector, Kistna District. Continued.]—Forms of Government, &c. among the Dards; by G. W. Leitner. [On the political institutions, habitations, &c. of the Ghligitis and other Dard tribes.]—Miscellanea; Notes and Queries. [The Kangra fort and royal family of Katoch; a lake legend of the Central Provinces; Marco Polo's route from Yunan; the Hindu temple at Tripetty; the Samlaji Fair; discovery of images of Hindu deities at Velangani in Tanjore (images of the village goddess Pidari, of Pillayar or Ganesa, of Naṭeṣvara or dancing Śiva, of Sandikeṣvara or Chandikeṣvara, and of Amman; these images, which are believed to have belonged to a Śiva temple once existing at Velangani, have been bought by the government); &c.]

*Bijdragen tot de Taal-, Land- en Volkenkunde van Nederlandsch Indië*, derde volgreeds, zesde deel, 2<sup>e</sup> stuk ('s Gravenhage, 1872).—Iets over von Rosenberg's Zending naar Nieuw-Guinea; door J. K. W. Quarles van Ufford. [Some account of the mission of Herr von Rosenberg, a native of Darmstadt, to the S.W. and N.E. coast of New Guinea, in 1858.]—Westersche Fabelen in een Oostersch Gewaad; door J. J. de Hollander. [Fifteen fables from Padang, translated, it seems, from European sources. The Malay text, with notes and a Dutch translation.]—Korte Opmerkingen over Balineesch en Kawi. [Grammatical, critical, and literary notes, communicated, from letters of H. N. van der Tuuk, by H. Kern. Also a Kawi passage giving a list of contents of the Mahābhārata in Kawi, compared by Dr. Kern with the Sanskrit original.]—De Maleische Handschriften in het Britsch Museum; door G. K. Niemann. [The Malay MSS. of the British Museum here described are twenty-four in number.]—Kolonisatie op Java; door P. A. Leupe.—De Naamssoorsprong van Java; door H. Kern. [The Sanskrit name of Yava-dvīpa was already known to Ptolemy in the sense of "barley island." This derivation has been doubted, on account of barley being no product of Java. W. v. Humboldt, R. van Eysinga, and Dr. van der Tuuk have derived the name from the modern Javanese *jaba* or *jawi* or Kawi *yawa*, "outer," with Sanskrit *dvīpa*. Prof. Pijnappel has lately proposed to derive it from the Sanskrit *japā* or *jabā*, which signifies the "Chinese rose." Prof. Kern rejects this derivation on phonetic grounds, and recurs to *yava-dvīpa*, *yava* here probably meaning some other plant than "barley," which is not uncommon with names of plants and trees in different parts of India.]—Leestafel. [Short reviews of Dr. Hunter's *Our Indian Musalmans*; M. E. Buissonet's *De Pékin à Shanghai* (Paris, 1871); and Dr. K. v. Scherzer's *Fachmännische Berichte über die österreichisch-ungarische*

### ERRATUM IN No. 52.

Page 269 (a), line 46, for "JOURNAL et CORRESPONDANCE de André-Marie Ampère, publié par M<sup>me</sup> E. C. Hetzel. Paris: Techener"—read "JOURNAL . . . . . Ampère. Paris: Hetzel."

POSTSCRIPT.—The *Athenaeum* states that Mr. R. Simpson, the author of *An Introduction to the Philosophy of Shakespeare's Sonnets*, is editing a series of reprints of the more prominent plays that may be regarded as belonging to Shakespeare's school. The first of these, now nearly ready, is *A Larum for London, or the Siege of Antwerp*; and *The Life and Death of Captain Stukeley, Mucedorus, Fair Ern, Histriomastix*, and the *Prodigal Child*, are announced to follow.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 54.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The Editor cannot reply to questions from authors respecting the notice of their books.*

*The next number will be published on Monday, September 2, and Advertisements should be sent in by August 28.*

## General Literature.

## RECENT WORKS ON VOLTAIRE.

*Voltaire et la Société française au XVIII<sup>e</sup> Siècle.* Voltaire et Frédéric. Par Gustave Desnoiresterres. Paris: Didier, 1870.

*Six Lectures on Voltaire.* [Voltaire. *Sechs Vorträge.* Von David Friedrich Strauss.] Leipzig: Hirzel, 1870.

*Voltaire.* By John Morley. Chapman and Hall, 1872.

To write the history of Voltaire is to write the history of his century. His influence told so deeply upon generally received habits of thought, and touched points so vital to the common beliefs of men, that his power was felt not only throughout the varied sections of the community of which he was a member, but availed to modify the existing conditions of European society. Materials lie about us in plenty, and there has been no lack of labourers in the field. They form a long list of names, which begins with Duvernet, and ends with Gustave Desnoiresterres, who in his valuable work, the fourth part of which has now appeared, fulfils all the most exacting requirements of modern science. For once the French man of letters has exchanged rôles with the German, and whilst M. Desnoiresterres takes upon himself the burden of arduous research, Dr. Strauss gives us an elegant abridgment of his labours. But then the subject is after all a countryman. Mr. Morley's position is totally distinct from both: he does not propose to rival M. Desnoiresterres by writing an exhaustive history of Voltaire, nor following the example of Dr. Strauss, to lay at the feet of an intelligent princess a finished and elegant memoir. Mr. Morley prefers to comment for us the essential points in his character, the critical moments of his life, just those facts in short which are significant to us of the nature and influence of this extraordinary existence.

It was in 1867 that M. Desnoiresterres gave us in his *Jeunesse de Voltaire* the first instalment of this biography. The appearance of each successive volume has called forth fresh testimony to the intrinsic merits of the work. The author has suffered no source of information, however remote, to escape his search, and he has applied to the treatment of the multifarious quantity of materials which he has assembled a cultivated intelligence and literary skill. The style is simple, the language at times even more than appropriate, and the grouping is managed with so much judgment as to effect that we are placed in possession of every possible detail without being oppressed by the sense of overcrowding. Chronology is one of the points on which M. Desnoiresterres has been obliged to bestow much attention. Voltaire himself was notoriously careless about dates, and his secretaries, Longchamp especially, seem to have followed

VOL. III.—NO. 54.

their master's example in this matter. The very date of his birth (November 21, 1694) was first placed beyond dispute by his latest biographer. And M. Desnoiresterres has not only brought into order the earlier years (which seemed in confusion past hope of disentanglement), but with unremitting care has verified every succeeding date, so that as far as he has gone we are now in possession of a thoroughly reliable chronology.

There is also another question which has inspired the curiosity and taxed the ingenuity of all who have approached the subject, viz. how did Voltaire obtain the princely fortune in the enjoyment of which he spent the last years of his life? To this ever recurring question no one as yet has succeeded in finding a satisfactory answer. If M. Desnoiresterres has not wholly explained away the mystery, he has at any rate indicated to us the direction in which we must look for explanation. The earlier biographers, like Duvernet, are all satisfied to remark that the gifts of the Regent, and the profits of *Oedipe*, placed him above requiring the aid of his family. But in his first volume, M. Desnoiresterres pointed out that the forty-five representations of *Oedipe* did not commence till November 18, 1718, when Voltaire was nearly twenty-five, and the gifts of the regent were bestowed at about the same date. It was on December 6, 1718, after his liberation from the Bastille, that he received from the duke of Orleans the gold medal and pension of twelve hundred francs. The papers of his father, too, contained proof that he was occasionally called on for supplies. The author quotes from the inventory taken at the death of M. Arouet, "Liasse 70, quittances relatives aux sommes accordées à son fils pour ses pensions depuis qu'il est sorti du collège." But M. Arouet did not, we may be sure, furnish his son with enough to support the expenses of a life which that son himself describes as a career of wild dissipation, carried on in the best society of Paris. Now and again Voltaire talks of money-lenders, and leads us to suppose that he passed his life in constant embarrassment. It is therefore with the utmost astonishment that we discover that in January 1722, at the death of M. Arouet, his son was already in possession of a small capital. Besides three "actions de la Compagnie des Indes," Voltaire had amassed about 5000 francs, which he had placed in the hands of his father, and this, too, at a time when he had only been three years in receipt of the regent's pension. So that throughout the years which he represents as passing in a career of reckless extravagance Voltaire was privately saving. Reckless extravagance laid the foundations of future fortune, just as idle dissipation produced *Oedipe*, *Artémise*, and *Henri IV.* Dr. Strauss in his preface quotes Goethe's remark that, just as now and again we see in old families that nature will bring forth an individual who unites in himself all the qualities of his ancestors, and shows in full perfection those peculiarities the existence of which in the race have hitherto been but indicated, so we sometimes see the virtues and vices of a great nation brought to a focus in one typical man. Thus in Louis XIV. there arose the typical king of France, and even so in Voltaire the nation found its typical writer. "Ne m'offusquez pas, car je veux paraître," said Henri IV. This "besoin de paraître," a distinct national peculiarity, was necessarily represented in Voltaire. "On a les défauts de ses qualités." This inborn necessity for striking an attitude explains away many of the at first sight contradictory tendencies which bewilder the student of his character. Voltaire's first impressions of cultivated life, as distinct from that of the middle-class, were received in the "société du Temple." Wit and dissipation seemed indissoluble companions. Voltaire's vanity was interested in assuming the outside of a fine gentleman. To parade the

airs of fashion and quality in the eyes of Paris was to increase his credit as an author, but he was too clear-sighted not to perceive that neither solid fortune nor reputation were thus to be achieved. Therefore, just as he studied and laboured in long intervals between revels which afforded him probably just that stimulus which was necessary to brace his nerves to willing work, so he strove at the same time to create for himself an income which should make him independent. But when he has to depict the situation, he has recourse to appropriate "décors du théâtre," to the heightening touch "qui fera bien dans le paysage." Mr. Morley thinks that "substantially Voltaire's transactions were very like those of any banker or merchant of the day." But M. Desnoiresterres, perhaps an even too impartial biographer, more than suspects the legitimacy of these dealings. Voltaire was sometimes unpleasantly canny in his choice of means to an end, and it is difficult to believe that his money transactions were governed by a loyalty which seems often to have been absent where his own advantage was concerned. He had access early not only to the salons of the great, but to those of the financial world, the attention of which had been drawn to him by his ode on the *Tribunal de Justice*, which had marked him out as one whose pen it might be worth while to conciliate; and his early training in Maître Alain's studio had put him in possession of a kind of knowledge valuable both for the getting and keeping of money. If, however, there is absence of proof as to how the first small beginnings were made, it is now clear that skilful operations in the lottery of the "Ville de Paris" first put him in possession of considerable fortune, and from what we know of that transaction, and from his speculations in corn under the assumed name of Demoulin, in the rue de Long Pont, and again in provisioning the army of Italy, from all of which he derived enormous profits, we are justified in concluding that in the absence of any direct source of income, money was obtained wherever it could be got, without overscrupulousness as to means. There is nothing in such conduct incompatible with the rest of the character, nor at variance with the quality of that particular type of which he is the most brilliant example. He himself says that, goaded by the humiliations which had to be borne by the poor man of letters, he resolved to shield himself from them by the acquisition of a great fortune. This he did to spend, and not to keep. "Assez de gens méprisent le bien," says La Rochefoucauld, "mais peu savent le donner." Voltaire was one of these few, and as a rule practised, as Mr. Morley reminds us, the virtue of magnificent expenditure.

On this point, and indeed on every other, Mr. Morley may be read with advantage as a commentary on the store of facts which M. Desnoiresterres has brought into order for us. Mr. Morley brings not only just judgment but sympathetic insight to his reading of the essential features of the great French genius. He seizes the clue which alone can guide us through the apparent perplexities and strange involutions of Voltaire's character. Instead of vainly trying to credit him with the more correct, ordinary, and pedantic virtues, he is everywhere found insisting on the intense generosity and sensitiveness of the man. People like Marmontel complained that he gave too ready countenance to worthless admirers and flatterers. This, Mr. Morley truly says, "had a source in his intense and sympathetic quality, and was an eager asking assurance from others that his work gave pleasure. The exact-steadying value to Voltaire of his sojourn in England is seized: 'he left a country where free-thought was an empty watchword, and found a land where men, if they had rejected Christianity, had at least thrown themselves with grave faith on the disciplined intelligence

and its lessons." And again, "so real a mind would exchange with delight the poetised astronomy of Fontenelle for the sure and scientific discoveries of Newton." In regard to M<sup>me</sup> du Châtelet and her relation to Voltaire, much is said marked by the same quality of just and intelligent perception. But Mr. Morley hardly seems to indicate with sufficient force the existence in her of that depth of warmth and passion, coupled with the power to bestow "imperial sympathy," which was first indeed revealed to us in the unpublished letters furnished by M. Feuillet de Conches to M. Desnoiresterres for his third volume, *Voltaire à la Cour*. Yet without this touch our conception of her must be incomplete. It is precisely this craving for heart affection which made her life with a man like Voltaire "extremely hard for her." In 1749 the tie came to an end, and Voltaire was "disastrously free." The Berlin court, but especially the French colony at the Berlin court, is admirably drawn by M. Desnoiresterres. It is a picture which cannot be regarded with satisfaction; to one of its most unpleasant passages—the Hirschel affair—he has given patient investigation. A lithograph of the original bill of the jewels left with Voltaire by the Jew is given, and an examination of this will suffice to convince any unprejudiced eye that the worst part of the accusation against Voltaire—viz. that of tampering with the document—is undoubtedly false. "There is," says Mr. Morley, "no more pitiful leaf in the biographies of the great than Voltaire's quarrels with ignoble creatures, names which recall vulgar, dishonest pertinacity on the one side, and wasteful, undignified fury on the other."

Perhaps the chapter of Mr. Morley's *Voltaire* which deserves to be read with most attention is that headed "Religion." Here the relation and influence of Voltaire on religion and religious opinion will be found discussed for once from the standpoint of calm intellectual enquiry. The author dispassionately points out Voltaire's failure to rise to the highest points involved in the great debate, and how this invalidated all that he wrote on religion; how he missed the emotion of holiness, the soul and life of the words of Christ and St. Paul; how he had no ear for the finer vibrations of the spiritual voice. But Mr. Morley also recalls to mind that Voltaire lived when, as he himself said, "Here Calas is broken on the wheel, there Sirven condemned to be hung, further on a gag thrust into the mouth of a lieutenant-general, a fortnight after five youths condemned to the flames. Is this the country of philosophy and pleasure?" "We must never forget," says Dr. Strauss, "that it was the furies of St. Bartholomew, of the dragonnades, and of the crusade against the Albigenes, which turned their torches in the hands of Voltaire against Christendom. 'He who says, think as I do or God will punish you, will soon say, think as I do or I'll make you.' Has this saying lost any of its fearful truth because it is a hundred years since Voltaire wrote it down?"

E. F. S. PATTISON.

The *Elegies of Propertius*, translated into English Verse by Charles Robert Moore, M.A., late Scholar of Corpus Christi College, Oxford. Rivingtons, 1870.

MR. MOORE in his short preface apologizes for the attempt which he has here made to introduce Propertius to English readers. This he need not have done; except Catullus, none of the Roman poets is more real as a lover than Propertius; and no erotic poet, either Greek or Roman, has spoken in tones more complex and elaborate. As a study of language as well as metre these elegies cannot fail to be interesting, even if on moral grounds they have sometimes been considered, as by the late Dr. Arnold, dangerous reading for boys.

The translation is for the most part in heroic couplets; but once or twice this rule is broken, e.g. v. 8, *Disce quid Esquilias*, where short lines in the style of Conington's *Virgil*, and v. 11, *Desine Paulle*, where elegiac stanzas of four lines are used instead. The former of these exceptions can hardly be considered happy; the latter might, we think, be worked into something better. And this may be said of the translation as a whole. Considerable as Mr. Moore's success may be allowed to be, there are very few pages which would not be improved by an extra year's careful retouching. The faults indeed lie on the surface, and are the faults of immaturity: e.g. 's for *is*, *I'll* for *I will*, *I'm* for *I am*; or grammatical inaccuracies: e.g. *Like she* for *Like her*, *had broke* for *had broken*; or bad rhyme, like *war*, *before*; *borne*, *dawn*. There is besides this much laxity in proper names; Mys appears as Myos, Myron as Myro; the familiar neuter *hippomanes* is transformed to a female Hippomane; the modern Tivoli figures side by side with Praeneste, Bevagna (Mevania) by Clitumnus, Alba by Nemi, p. 105; and *Dorica castra* is translated "Doria's chivalry," an expression which recalls Genoa and the great Genoese admiral rather than Troy and the Greeks encamped before it.

The following is a fair specimen of the translation, iv. 4, 7 :—

"Now, school'd in warfare, spread the canvas wide,  
Lead forth the coursers, knights, in all their pride;  
Go, Fortune smiles, avenge the slain, and be  
One more bright page in Roman history.  
Great Mars and Vesta's fateful fire, I pray,  
Grant I may live to see that happy day  
When Caesar's laden chariot sweeps along,  
The steeds half fretting at th' applauding throng."

The four lines iv. 6, 30 *sqq.* are well translated thus—

"If tale so sad my Cynthia wept indeed,  
Run back the way thou camest, run with speed;  
Weep, and be this the burden of thy song—  
Wrath she may get from me, but never wrong."

The distich, ii. 18, 29, 30, is simply and effectively rendered—

"But thou wilt come adorn'd enough for me  
If thou but come as often as may be."

On the whole, though marred by imperfections, this translation is not, as the author fears, a failure, and with more elaboration might be made a success. R. ELLIS.

**Correspondence and Conversations of Alexis de Tocqueville with Nassau William Senior.** Edited by M. C. M. Simpson. King and Co.

THE proper subject of this work has been intrenched upon by two earlier publications; the *Life and Correspondence of de Tocqueville* would have been incomplete without at least some of the letters of his oldest English friend, and it was impossible to omit from Mr. Senior's *Journals in France and Italy* all mention of his most able informant and most constant companion. On the other hand, the letters and conversations now collected have the appearance of a united and continuous whole, which cannot be said of a mixed correspondence or a miscellaneous journal, and in this case the whole is sufficiently valuable in itself, as well as sufficiently characteristic of its joint authors, to excuse the unavoidable repetitions of some interesting passages. To contemporaries Mr. Senior's note-books have all the interest of gossip, and we are content, as in real conversation, to run the risk of now and then hearing the same thing twice over; but posterity may be less indulgent, and the journals have a right to look forward to its judgment, because of the solid kernel of instructive information which they offer, not so much to the historian proper as to the historian of society and of opinion. For this reason we should be glad to think that the present

arrangement is not final, and that when the volumes which now overlap have had their short day of success with the general reader, they will be succeeded by a complete and methodical edition of everything that the indefatigable author thought worth preserving. Voluminous and even tedious as the collection might seem, it is the best way of doing justice to Mr. Senior's peculiar gift, for no editor, however well informed, can hope to divine correctly which trivial fact, which careless prognostication will become luminous half a century hence, while yet it is a pious duty to see that no such chance is lost.

In some ways the volumes before us show better than their predecessors the precise nature of Mr. Senior's services to historical truth. In one letter he expresses a hope that de Tocqueville will not find him "an unfaithful Boswell," and if he had really stood in that humble and useful relation to any one, it would perhaps have been to the author of *Democracy in America*. But when we compare these notes with the records of his conversations with other celebrities of all sorts and sizes, we see how little his painstaking curiosity was dependent on the stimulus of admiration for the views expressed. His interest, and therefore ours, is much more general. The chief value of the correspondence with even this intimate friend is not biographical or personal; it might, with perfect propriety, be called "The Opinions of a Conservative Liberal in England and France from 1835 to 1859," and neither its usefulness nor its literary attractiveness would be in the least impaired by the change. A Boswell undertakes his task either because he admires every individual utterance of his hero so much that he wishes none may be lost, or because on general grounds his admiration for the man is so high that he assumes whatever he says is valuable merely because he says it. It need scarcely be said that Mr. Senior's attitude to his examinees was very different from either of these. His own view of the matter appears in the following passage from a letter to Archbishop Whately:—"You must recollect that in all these conversations my object is to record what my companions said, not what I said myself. My own words are introduced as sparingly as possible, merely to render intelligible what was said to me. My journals are therefore full of most extravagant opinions and statements, unopposed, indeed uncomplemented on, by me—but certainly no more acquiesced in than what is reflected by a mirror is acquiesced in by the man who holds it." But the man who holds the mirror chooses the objects that shall be reflected in it, and is alone responsible for the choice; Mr. Senior's originality lay in the manner in which he exercised it. Like a locomotive, permanent commission of enquiry, he took the evidence of any one who liked to offer it, but the persons he was at most pains to interrogate were—not those who could most easily turn their opinion into action, or whose opinion was of most speculative weight—but the representatives of an intellectual type, the men who make an opinion important by holding it, because they are certain not to hold it alone. Thus many of the remarks he has preserved are perfectly commonplace, and such as must have been made over and over again in dozens of newspapers; true or false, the historian of opinion would not think of discussing them on their own merits; but coming from the mouth of this or that distinguished public character, they are a part of the social and political forces actually existing, and it was the number and kind of these forces which Mr. Senior seems to have made it the business of his life to examine and appreciate. His task was the easier because he had no wish to shine himself, and was quite careless about convincing his companions; sometimes he seems almost to play the part of an animated "man of straw," making just the

most obvious answers to objections so as to keep the discussion alive without really influencing its course. Even on points about which he felt strongly he was never carried away by the spirit of debate so as to press his own advantage or expose his opponent's inconsistency. In return for this self-denial, he only asked his friends to let him help them to talk their best, and it is not strange that few were churlish enough to deny the modest request.

Unlike most political memoirs, his note-book is least interesting where it deals with historical luminaries of the first magnitude. As de Tocqueville warned him, such personages, when aware of his habit of reporting conversations, were careful only to say what would look well when written down, and though the lapse of time may make it interesting to know what, for instance, Thiers wished to be thought to think about French politics in 1854, what de Tocqueville and Ampère really did think is of more importance, because their influence was a constant and positive fact, which in the long run would outweigh any single diplomatic manoeuvre. Of course the question of paramount interest throughout these two volumes is that of the political future of France; even to English readers questions of domestic policy, like the new Poor Law or the Reform Bill, seem tame by comparison. And notwithstanding all that has been written to explain the possibility and the success of the Second Empire, there is still something to be learned from Mr. Senior's mirror, as it reflects the successive hopes and fears of men honest, intelligent, and even brave, yet perfectly incapable of providing a remedy against the evils they foresaw. De Tocqueville and his friends could calculate within a few weeks when the next *journée* in the streets might be expected; they had been talking familiarly of the *coup d'état* for months before it came; conditional prophecies of remarkable acuteness are too plentiful to be enumerated, and yet, when the day of danger came, these men, the best representatives of aristocracy in France, could do nothing for either themselves or their country but cry, "A Mazas," and once in durance, their chief feeling was one of relief that "the struggle was over" without fault of theirs. Manzoni gave as a reason for avoiding politics that he was "incapable of distinguishing between the desirable and the possible." De Tocqueville's weakness as a politician seems to have arisen from an over-anxiety to avoid that common snare of inexperienced statesmen; and in practice he carried caution so far as to amount to recklessness. In July 1851 he wrote, "The government which I should prefer, if I thought it possible, would be a republic; but believing its continuance impossible" he was content to trust partly to Louis Napoleon's incapacity, partly to his moderation to mitigate or abridge the despotism which he saw no means of resisting or averting.

The *Droit au travail*, second in importance of the subjects which recur in the correspondence, is treated in very much the same spirit. In his letters to Senior, he dwells on the fact that a poor law on the English model, "affording relief on terms less acceptable than wages," would not satisfy the hopes excited by the extensive socialist agitation. But whatever the faults of the English Poor Law, its use as a barrier against socialism depends on the peculiarity—much open to abuse—that a resolute pauper has the law on his side if he insists on spending his life in the workhouse. But in the speech which characterized socialism as "un appel énergique, continu, immodéré aux passions matérielles de l'homme," he argued at length against admitting the *right* of the poor to either work or relief, and insisted that the state should only organize "Christian charity." The most severely unpopular measure that an *Anglomane* political economist could invent would have been practical as com-

pared with such a suggestion, and such a suggestion made in May 1848 was little better than a mockery, as no one knew better than de Tocqueville when it was his turn to think instead of to act.

The difficulty of foretelling the course of history is very completely illustrated by the guesses as to the probable duration of the empire which were commonly made during its earlier years. M. Beaumont said, "I should give him fifteen years if I thought him capable of using the immense advantages of his position." Most of the other prognostications had a condition attached, and the prophets were generally right as to the different alternatives that were possible; only their calculations were apt to be disarranged by the one incalculable element, the personal character of the usurper. At other times a plausible conjecture turns out incorrect because one of the many influences that could affect the result was forgotten. There is an instance of this in the second volume:—"The corruption that infects the civil service must in time extend to the army, and make it less fit for service." "Of course it must," answered Tocqueville. "It will extend still sooner to the navy. The *matériel* of a force is more easily injured by jobbing than the *personnel*. And in the navy the *matériel* is the principal." Recent changes in the art of war have raised the importance of the *matériel* in the army, and the *personnel* escapes corruption best which is furthest removed from its seat. On the page before, we read, "No corruption that ever prevailed in the worst periods of Louis XV., nothing that was done by La Pompadour or the Du Barry resembles what is going on now," *i.e.* May 1853, for the date of these general statements is the most instructive part of them. This was the time when men's consciences were finding their price, and scandal of all sorts was so rife in society that de Tocqueville thought the reign of *friponnerie* could not last much longer; but by 1857 things had found their level: Paris was peaceable, and, for the first time for many years, Paris was dull; the Bourse was the one excitement, extravagance the one employment. When the price for which men's consciences had been sold was all spent, scandal revived, and the virtuous indignation of *La Lanterne* had all the effect de Tocqueville anticipated.

The conversations are not all political; those of a miscellaneous nature are worth reading, though not perhaps worth quoting. A good story is told of Nicholas and Lamoricière, who had been sent to praise the republic to him in 1848. The czar replied, "My good friend, there was no need to tell me all this: I have not the least wish to interfere with you. Whether you have a republic, or a dictator, or an emperor, I do not care a rouble. The only government that I cannot tolerate is a constitutional monarchy, and in your case I see no immediate danger of that." It is not quite evident upon what principle some of the speakers in the journal appear only under initials, as they are for the most part identifiable with persons elsewhere mentioned by name. Another superfluous precaution is that of giving the original of de Tocqueville's comments on Mr. Senior's memoranda; the translation, which is quite trustworthy and idiomatic, would have been enough for them as well as for the letters. But these are trifling details: in the main, the editor has done enough, and not too much, to what under any circumstances must have been an interesting publication.

H. LAWRENNY.

#### LITERARY NOTES.

The 1207th volume of the Tauchnitz Collection of British Authors consists of selections from Shelley, preceded by a graceful and sympathetic essay by Miss M. Blind, which originally

appeared in the *Westminster Review*. Shelley has never met with anything like adequate recognition from the general public, and consequently he is the only one of the great group of poets of the beginning of this century, of whom it cannot be said that a trustworthy traditional estimate exists. In default of criticism Miss Blind presents the tradition of his admirers in its most intelligent form, perhaps her admiration of *Julian and Maddalo* is exaggerated; if it was inevitable to sacrifice something, we may still be permitted to regret that, while *Julian and Maddalo* is given entire, we have only the exordium to *Alastor*, and that such copious extracts are given from the *Revolt of Islam* as to leave no room for more than two acts of *Prometheus Unbound*. Though we think Miss Blind overrates the *Revolt of Islam*, there is undoubtedly, in the case of a poet like Shelley, in whom the constructive faculty was almost always completely overshadowed by the prodigious development of other and higher faculties, a good deal to be said for the principle of giving extracts from a larger number of poems rather than a smaller number uncurtailed.

In the *Cornhill* some translations from an Arab poet of the twelfth century, Abu'l Fadhl Zoheir (b. 1186 A.D.) are remarkable for their very modern tone: the artificial polish which is characteristic of Arabian poetry in general makes way in his *vers de société* for comparative simplicity of language, and the fancifulness of his imagery is not much more strained than that of the Caroline poets.

In reviewing a French translation of Horace Walpole's letters in the *Revue des deux Mondes*, M. Caro brings out the ineffaceable influence of national idiosyncrasy in writings that would at first sight seem most free from it. Walpole's letters are almost the English equivalent of Madame de Sévigné's, the great object of his admiration, and yet, when reproduced in French, they constantly strike a cultivated reader as "Britannic" in animation and humour.

Prof. Gnoli, who is charged by the city of Rome with the task of marking the houses of memorable visitors with a tablet bearing their name, describes in *Im Neuen Reich* (July 19) the inductive process by which he identified the site of the house occupied by Goethe in 1786, but as the house itself has been almost entirely rebuilt since then, his ingenuity seems to have been somewhat wasted; but the German pilgrims to the Eternal City may be of a different opinion.

### Music, Drama, and Painting.

**The Works of Couperin.** [*Denkmäler der Tonkunst. Werke von Couperin*; herausgegeben von Johannes Brahms. Erster Band: Clavierstücke, erstes und zweites Buch.] Bergedorf bei Hamburg: H. Weissenborn, 1871.

FAMILY likeness has been perhaps as often and as strikingly exemplified in a talent for music as in any other speciality of mind or body. With some of the greatest names in musical history more than one person, indeed many persons, of great ability are associated. The sons of Palestrina have been lost to posterity in the shadow of their father's greatness; yet all three, even the two who died young, were regarded with favour by their contemporaries. The brothers Anerio are in their works, and possibly in their persons, continually mistaken for one another, or supposed to be identical. Three generations have augmented, not, however, in an increasing ratio, the renown of the Scarlatti. Henry Purcell was not the only musician of his family; and William and Henry Lawes are rarely mentioned separately. The individuality of the elder Mozart would seem to have merged in that of his son, who by this time might have been as completely forgotten as any other of the juvenile prodigies who have succeeded him, had he not found in his father a teacher whose patience, discretion, and disinterestedness approached, if they did not attain to, the quality of genius. The excellent musicians who have borne the name of Bach, if not innumerable, have never been numbered. Even those

who attained reputations only inferior to that of John Sebastian form a considerable list. So with the name Couperin, which represents a family so remarkable that the author of the pieces which form the volume named at the head of this paper was distinguished from his father, uncles, aunts, daughters, nephews, and nieces as "le grand Couperin." The volume itself—an evidence alike of the catholic taste and industry of one of the greatest of living composers—is a very precious contribution to the archives of music; not merely interesting—though this is much—in so far as it marks the condition of a particular kind of art at a particular time, but as a collection of music, whenever and by whomsoever composed, at once beautiful and individual. It includes the first and second "livres," and therefore not all, of the "*Pièces de Clavecin*" published by their author in the years 1713 and 1716–17. Of these original publications—magnificent folios printed from copper-plates—copies, never very numerous, have now become rare and costly. Single pieces and even small collections of them have recently been edited by English musicians, the first of whom, I believe, was Mr. Lindsay Sloper. Before this, Couperin, save to the curious few, would seem to have been, during the present century, little more than a name, even among his own countrymen. Clementi's *Practical Harmony*, still the best collection of the clavier music of the last century, contains no specimen of his compositions; nor indeed, with the exception of an "*Allemande*" in Hawkins' *History of Music* (vol. v. p. 48), have I met with one in any work, German, French, or English, of more than ten years' standing.

The clavecin music of "le grand Couperin," of which the volume edited by Herr Brahms exclusively consists—practicable, it need hardly be said, on the clavecin of to-day, the pianoforte—is of two distinct kinds: dances, or more properly pieces, however developed, sufficiently marked in their rhythm to be danced to—gigues, menuets, gavottes, sarabandes, and the like; and what may be described by the modern familiar title, "songs without words." In the first of these forms, Couperin, relatively not merely to his contemporaries but even his immediate successors, is one of the most ingenious and pleasing of composers. He was the predecessor by nearly twenty years of Händel and J. S. Bach, and already a renowned composer and clavecinist when those great masters were practising their scales. Nevertheless not a few of his pieces in this first kind will easily bear comparison with all but the best of theirs. In the second kind, he has stood till very recently quite unrivalled. No doubt music suggested by some circumstance or thing, or rather the sentiment awakened by its consideration, had been attempted by French composers anterior to, and certainly known to, Couperin. None of these, however, not even Denis Gautier's *Tombeau de Madlle de L'Enclos*, has lived to impugn Couperin's originality. Nor, till very recently, have instrumental composers attempted to follow up the route in which Couperin, if he did not first enter it, made such way. For the volume before us consists in great part of these "songs without words," the variety in the titles of which perhaps exceeds that in the music to which they are prefixed. Couperin, like greater masters, occasionally repeats himself; or perhaps it would be fairer to say that many of his pieces are, or seem to us, very much alike. This arises partly from their brevity and simplicity in form; partly from the little variety of key employed in his age, though in this respect he is in advance of it; and, more than all, from his very frequent employment of the minor mode—the last trace of an unwillingness to accept our "natural scale," but the old masters' "*modo lascivo*." But Couperin's facility in the invention of titles is marvellous. Here are a few which follow in immediate succession: *Les Sylphides*, *Les Abeilles*,

*La Nanette, Les Sentiments, La Pastorelle, Les Nonètes* (sic)—première partie, *Les Blondes*, seconde, *Les Brunes*. The connection of these titles with the particular music which follows them is not always very obvious; as, indeed, is the case with a good deal of the music of our own time. A marked character is given to *Les Sylvains* by its limitation to the compass of the male voice, and in like manner to *Les Abeilles* by its "medium" pitch, tranquil motion, and limited range of notes. Couperin had certainly seen the bees

"murmur by the hour in fox-glove bells."

But how *Nanette* differs from other young ladies, or what particular "sentiments" are suggested by the fourth piece in my list, are likely to remain puzzles "till time" and tune "shall be no more." *La Pastorelle* always makes herself known and understood without difficulty; but *Les Blondes* and *Les Brunes*? How does my reader suppose they make themselves distinguishable? Both utter the same strain, but the former in the minor, the latter in the major mode! Now I assert, with little fear of contradiction, that nine modern musicians out of ten would have reversed this arrangement; would have felt the minor mode, with its average reticence and occasional volubility, the persistent sadness of its lower tetrachord, and the three varieties of its upper, to be more characteristic of the brunette than of the blonde, whose evenness of temper and clearness of thought would seem to find their juster expression in the natural scale. The choice, however, lets us a little into the composer's tastes and likings. Certain it is, if anything certain about a man is to be gathered from his works, that Couperin, like his contemporaries, preferred the minor to the major mode. We are driven, then, inevitably to one of two conclusions: either that Madame Couperin was a blonde, or that Monsieur Couperin wished she had been. Having settled the domestic relations of the composer, to our own satisfaction at least, let us return to his music.

Couperin has many moods, but his prevailing mood is tenderness. In the volume before us the student will find many pieces characterized by strength, but many more characterized by sweetness. The composer has himself distinguished these in almost all instances by their titles. Thus the volume opens with a stately "Allemande," which he has well named *L'Auguste*. This is shortly followed by an equally stately "Sarabande," headed, *La Majestueuse*. Farther on, among the pieces of the "dixième ordre," we find an extended "battle piece," in which may be found a good many of the effects introduced a century afterwards by Kotzwara, as novelties; and near the close of the volume an essay in musical comedy, entitled, "Les Fastes de la grande and ancienne Mxnstrxndxsx," in the course of which we are introduced to "*Vielleurs, Gueux, Jongleurs, Sauteurs et Saltimbanques, avec les ours et les singes*," not forgetting the "invalides ou gens estropiés au service de la grande Ménestrandèse," whose performances come to an end in "désordre et déroute causés par les ivrognes, les singes et les ours." These, however, present exceptions to the general character of the collection, in which titles and music answering to them abound like *L'Enchantresse, Les Idées heureuses, La Voluptueuse, Les Papillons, La Pateline*, and *Les Ondes*, the most touching and elegant only of which I thought I had marked in going through them, for my own and my readers' future reference. My marks are, however, too numerous to serve any purpose but that answered by notes of admiration. At the end of the volume will be found an "Explication des agréments et des signes," which should be carefully studied before any attempt is made to play the pieces which precede them. These "agréments" are not mere effects to be omitted at the will of the performer, but essential parts of

the music. It is greatly to be hoped that Herr Brahms will include in his collection of the works of Couperin "*L'Art de toucher le Clavecin*"—a short and well written treatise, now most rare, hardly less applicable to the keyed instrument of our day than of his, and from which the intelligent student may gather some idea at least of the manner in which the music of "le grand Couperin" and his successors should be played. One of not the smallest advantages which may result from re-publications like this which we owe to Herr Brahms may prove to be the restoration to the family of contemporary instruments of the harpsichord. Meanwhile, however, the pieces in them can be satisfactorily played on a pianoforte, and this by performers whose mechanical skill is a good deal inferior to their sentiment and intelligence.

JOHN HULLAH.

#### THE DRAMATIC SEASON, FRENCH AND ENGLISH.

THE season of French plays in London this year has been unusually long: but, with one or two brilliant exceptions, sterile of interest. Perhaps M. Félix had reckoned too surely on the expected visit of the Comédie Française, and had therefore neglected to provide other attractions. To begin with, the winter season was very discouraging. Everything, the weather, the illness of the Prince of Wales, the Christmas pieces, combined to keep the St. James's Theatre empty. Moreover it is to be feared that London playgoers have no genuine love for French plays. The fashionable world will go once or twice during the season because it is proper so to do, and furnishes a topic of conversation: but the general public is too little acquainted with French to be able to follow a play with facility, and too indifferent to buy the piece first and study it carefully. This lazy temper is due, to a great extent, to the present condition of our own stage. One of our modern plays taxes the attention so little, possesses so few claims to literary or artistic merit, that persons naturally conclude that the plays of other countries are equally insipid. That few of the Parisian novelties were given to us was no fault of poor M. Félix. Play after play was submitted to the Lord Chamberlain, only to be rejected by that Cerberus of our dramatic purity. When such works as *La Baronne* or *Fernande* were forbidden, one wonders on what principles his licenser makes his selection. Nor does this wonder diminish when we see the actual plays that are allowed. If *Fernande*, one of the ablest and most powerful dramas, and, it may be added, one of the most moral, that have been acted in France for many years, is too highly flavoured for the chaste eyes and ears of English audiences, why allow *Madame attend Monsieur*, a piece whose nastiness is only equalled by its vulgarity? Who are Chaumont and Schneider that they should enjoy privileges denied to others? And yet, during the very seasons in which Lafont was forbidden to play *Les Vieux Garçons* and the Comédie *Julie*, the second of these ladies, Schneider, was kicking up her heels as high as she liked in *La Grande-duchesse*, or hiccapping in *Périchole* louder than ever she dared in Paris. And lately, after the pieces alluded to above had been forbidden, M<sup>me</sup> Chaumont was allowed to act and sing nearly every piece and every song that she chose. Was *Le Ménage en Ville* a delicate or an improving comedy? Could in fact anything be much coarser? But the pass we have come to is simply this—we are allowed to do anything we like on the stage in England, provided we say as little as possible. Society winks demurely at the nudities of burlesque, and blushes with simulated modesty at the *School for Scandal*, which would scarcely obtain a license nowadays.

After a few performances by M. and M<sup>me</sup> Lafontaine, and a long series by M. Ravel, upon whom, it must be admitted, age is beginning to tell painfully, *Christiane* was produced, a four-act play by M. Gondinet. It is difficult to understand the reason why this play should have been so successful as it was in Paris: particularly before so critical an audience as that of the Théâtre Français. When it is read, the characters appear unsympathetic, the action prolix, and the dialogue destitute of wit or sparkle. But on the stage, thanks to the art of M<sup>ms</sup>. Delaunay and Febvre, and the charms of M<sup>lle</sup> Reichenberg, many of these defects vanish. Still it is a poor piece, and could not have done much to retrieve the fortunes of M. Félix, though it was

presented with much care, and the company played well together. Then we had M<sup>lle</sup> Adèle Page in several parts—of which perhaps the hackneyed *Adrienne Lecouvreur* is the best: M<sup>lle</sup> Fargueil in *Nos Intimes*, *Dalila*, and *Pattes de Mouches*—and lastly in *Rabagas*. By this time the company had been greatly strengthened, and the performance of the play was in every respect equal to the original one at the Vaudeville, and in some respects superior. As a social and political satire, it is difficult to overrate the merits of *Rabagas*, though as a play it is too long, and too deficient in interest. But nothing can be better than the conception of *Rabagas* himself: the noisy, pliant demagogue, who bullies his associates, and truckles to the prince—or than that of the prince himself, the very incarnation of high-bred gentility, kindly and humane; and anxious, after his own fashion, to work out his people's good. Some of the smaller parts are excellent too. The chamberlain is a very humorous specimen of a court official; and the republican coterie at the "Crapaud volant" is a singularly well-chosen assemblage of types, not too highly coloured, of extreme republicanism. The dialogue is admirable. Its shafts of wit and raillery spare no one: moderate men may laugh at the sarcasms levelled at their opponents, and communists rejoice that the party of order does not escape without a blow. Berton, who played *Rabagas* in London, conceived the part differently from Grenier, the original, who was specially chosen by the author to play it, and to play it in a particular way. He was noisy and blatant, and is said to have imitated Gambetta: Berton was voluble and oily, with an under-current of passion, that he could bring out upon occasion, as he does in the fine scene in act iv., when he flaunts the letter in Mrs. Blunt's face. M<sup>lle</sup> Fargueil acted the latter personage far more finely than M<sup>lle</sup> Antonine did. Her first scene with *Rabagas* was extremely clever; she plays with the dreaded revolutionist, secure of victory in the long run, as a sportive spider might do with a rebellious fly; and in the next act, when she has succeeded so far as to bring him to the palace, the scene in which she assures him he need have no fears on the score of what the prince may say or do, for "Le prince, c'est moi," was a triumph of acting of the highest quality of comedy.

In Paris itself no new play of importance, except *Rabagas*, has been produced since the war. There have been however some very interesting revivals, especially that of *Ruy Blas* at the Odéon. It was very nobly played throughout, by performers of education and refinement, who understood the literary as well as dramatic importance of the work they had to interpret. This was especially to be noticed in M. Geffroy, formerly sociétaire of the Français. His Don Salluste was one of those perfectly beautiful creations of the dramatic art which can only be produced after a lifetime has been spent in the study and practice of it, added to the possession of great individual talent and personal gifts. He looked like a portrait of Velasquez stepped from its frame: dignified, sarcastic, devilish: every gesture, every look, even the most insignificant movement, had a meaning, and served in some way to elaborate and complete the most perfect picture of a cold and haughty Spaniard that could be presented on the stage. The *Ruy Blas* of M. Lafontaine was picturesque, but unequal. He began very well, telling the story of his love in an undertone of grief that was extremely touching, and denounced the greedy senators with much fire and scorn; but his love scene with the queen was a sad failure. He ranted and flung himself into attitudes that were meant to move to admiration, but succeeded only in moving to laughter. However, he made up for all shortcomings by his performance in the last act. He left nothing to be desired in that magnificent scene where *Ruy Blas* faces Salluste at last, and exclaims with exultation,

"Je te tiens écumant sous mon talon de fer."

Lemaître himself could hardly have been better: if indeed he was so good, for he never could have had the cultivation necessary for the adequate rendering of the poetic drama.

In London—apart from the usual dreary plays, to one or two of which the long-suffering audience has had the pluck to do summary justice—we have had some interesting revivals, among which that of Lord Lytton's *Money* at the Prince of Wales's must take the first place. The management has taken unusual pains with its production in every way; and though faults may easily be found with parts of the interpretation, yet on the whole it is admirably rendered. And it must never be forgotten that the Prince of Wales's is the one theatre in London with a

company: a definite set of performers who are persons of talent, accustomed to play together, and of whom the very best are satisfied with small parts upon occasion for the sake of the work that has to be given. *Money* is full of small parts: but they are all good: on them the success of the piece depends: and they are nearly all associated with the name of some celebrated actor in the original cast at the Haymarket, which was exceptionally strong. At the Prince of Wales's they are all appropriately presented: the performers realise the character entrusted to them with intelligence: and if some old playgoer, whose recollections carry him back thirty years, should be crusty enough to maintain that they are not half as good as the originals, why, let him be set down as a grumbling, cross-grained, *laudator temporis acti*! The Captain Dudley Smooth of Mr. Archer is quite admirable. He is new to the London stage; and his acquisition for such a part as that is singularly fortunate. His quiet easy bearing, his cat-like step, his thin lips, long hands, pale face, and premature baldness, combine to realise to the life the portrait that the author has drawn of the consummate gambler, "who never inherited a sixpence, never spent less than 4000*l.* a year, and never told a soul how he managed it." It is difficult to imagine how Wrench could have been better: but it is said that he was. It is much to be regretted that the opening scene of act iv., in which Smooth leads Evelyn's tradesmen to believe that he is ruined, without committing himself to anything more definite than "Have you been paid, Sir?"—should have been suppressed. Mr. Coghlan gives us, for the first time, a thoroughly consistent, flesh-and-blood, Evelyn. Hitherto the part has been played in that stilted, pompous style that was thought proper for all meditative persons from Hamlet downwards, till Fechter banished it, let us hope for ever. Perhaps the highest praise that can be given to Mr. Coghlan is to say that he manages to make all the "tall talk" written down for Evelyn appear plain natural common sense—a feat that surely no actor ever achieved before! At times he may be a little too brusque: but the author evidently intended that Evelyn should be downright rude at times to Clara Douglas, or too sharp in attacking the weak side of Sir John Vesey's character, or deficient in polish when doing the honours of his own house: but after all the adverse criticism that can be brought against him has had its say, one is compelled to admit that he is the one supremely able exponent of the part that has been seen in our time. It is a pity that Mr. Hare should have attempted to portray that bland and unctuous humbug, Sir John Vesey. His sharp, crisp manner is quite out of place there; and he seems unable or unwilling to adopt any other. Miss Brough is a very graceful Clara, and Mrs. Bancroft, of course, an excellent Georgina: but Mrs. Leigh Murray is overweighted with the lively, audacious Lady Franklin: a part which would have been far more suitable for Mrs. Bancroft herself. But, whatever fault we may find, however justly we may criticize minor defects, *Money* is very well played at the Prince of Wales's, and the public evidently take a delight in seeing, what is so rare in England, a good play well performed. That the public does like good old plays better than indifferent new ones is proved by the fact that *London Assurance* lately ran for nearly two hundred nights at the Vaudeville, only to be displaced by that dramatic evergreen, *The School for Scandal*. The absence of anything like a school of acting in England becomes painfully evident when one of the old comedies is attempted. The language, the manners, and the dress are alike strange to the performers, who are infinitely more at home in the tomfooleries of burlesque. This is particularly the case at the Vaudeville, where the representatives of Sir Benjamin Backbite and Crabtree play leading parts in the *Very Last Days of Pompeii* afterwards, and have imported the airs of the burlesque into the comedy. The sight of so many people on the stage at once as are assembled in Lady Sneerwell's drawing-room seems to suggest a breakdown to their minds: and one cannot help fancying that their arms and legs every now and then give involuntary twitchings, and that a general dance of all the characters is becoming inevitable. That the actors should be strangely and incongruously dressed was only to be expected from the usual practice of our stage in these matters. Still, it is surely very odd that the style of a century ago should have been so completely forgotten as to admit the ludicrous caricatures one sees in what are called "costume pieces." What would be thought of a gentleman who walked down Pall Mall in a dress coat, a

morning waistcoat, a pair of footman's breeches and stockings, and a coachman's wig on his head? Yet certain characters at the Vaudeville cut no better figure. Mr. Farren's Sir Peter Teazle is an accurate copy of one of his father's great parts, but, like all copies, wants energy and nature: it is sensible, however, and painstaking. The Lady Teazle of Miss Fawsitt is bright and animated. By far the best piece of acting, however, is the Joseph Surface of Mr. Clayton. Throwing aside all the traditions, he makes Joseph a gay man of fashion (as the play warrants him in doing) who is quite as ready as Charles for any intrigue that may fall in his way, only he is a calculating, hypocritical schemer. He is really in love with Lady Teazle, and only affects a devotion to Maria for the sake of her fortune. Mr. Clayton realises this view in a way that leaves nothing to be desired. His deference to Lady Teazle whenever they meet is admirable, and the love scene in act iv. as passionate as the dialogue warrants, and that is saying a good deal. To this fine conception he adds a perfect bearing, and a costume that is accurate to the minutest detail of the time.

Mr. Bateman's management of the Lyceum seems likely to bring forth good results. *The Bells* was a well-written melodrama, original in idea and execution, and admirably acted, not merely by Mr. Irving, but by the whole company. The production of *Medea* would seem to show that he is anxious to try whether poetic plays can ever again become popular in this country. That he should have selected the well-known story of "Medea" may excite surprise: for she is an utterly unsympathetic person, whose conduct almost justifies Jason's treatment of her; and the other people of the play are dummies—from that terrible bore Orpheus down to the two children. Moreover, the conception of the part is encumbered by the recollection of three great actresses—Pasta, Ristori, and Titiens. Out of these unpromising materials, however, it must be admitted that Mr. Wills has made a very good play. His verse cannot be called musical or scholarly: there is no classical feeling whatever in his work from beginning to end: but he has cleverly arranged the story so as to keep its human side prominent: he has made some changes so as to bring forward Medea's love for her children; and he has introduced a very effective incantation, with the proper accompaniments of a darkened stage and a red light. But the demerits of the play are forgotten in the admiration called forth by the talent of the principal performer. Miss Bateman is not merely a clever exponent of the part: she is an artist endowed with real tragic power, who, whether in pathos or in passion, carries her audience with her, and makes them forget all that is stilted or absurd in the play in sympathy with the heroine with whom she has identified herself. From her performance of Leah it might have been expected that she would have been greatest in passages of indignant declamation; but this is not so. The scene in which she is threatened with the loss of her children develops in her a new power: that of touching her audience by her ability in depicting tenderness. Moreover, it is most agreeable to notice how Miss Bateman progresses in excellence. Her Leah was good: her Mary Warner was better: but in *Medea* she has made a decided advance, which augurs great things for the future. It is refreshing to think that we have at last a tragic actress: that if plays be only forthcoming, an adequate exponent will not be wanting.—Curiously enough, at this very moment the Théâtre Français exclaims that it has discovered a real actor—young Mounet-Sully, a pupil of the Conservatoire, who bids fair, they say, to rival Talma in his greatest parts—to be as a man what Rachel was as a woman: to achieve, in short, the highest distinction in his art.

J. W. CLARK.

### ART NOTES.

The Imperial Austrian Commission has issued the programme and regulations in accordance with which the Imperial Government proposes to conduct the Exhibition of 1873. All applications and enquiries must be addressed, up to August 24, by British exhibitors, to the English Royal Commission, through the secretary, Philip C. Owen, Vienna Exhibition Offices, 41, Parliament Street, London. The Austrian commission will communicate with exhibitors from foreign countries solely through the commission appointed by each country for that purpose. The exhibition opens the 1st of May, and closes the 31st October,

1873. Lists are to be sent in of the exhibitors, together with the plan of space required, before 1st January, 1873. Exhibitors have to defray all expenses not provided for by the Austrian commission, which has made arrangements for the reduction of transport charges within its own dominions. Exhibitors of fine arts are exempted from any charge for space. Insurances against fire are to be effected by the exhibitor at his own expense, and he is also responsible for the packing, forwarding, receiving, and unpacking of his goods both for the opening and close of the exhibition. The objects will be submitted to the judgment of an international jury, and special regulations will be issued for the fine arts. Exhibitors receive tickets entitling them to free admission.

The *Gazette des Beaux-Arts* for Aug. 1 contains an important contribution from the pen of M. Henri Delaborde. The article in question is entitled "Les Estampes d'Andrea Mantegna," and forms part of a work on the Elements of the History of Engraving which M. Delaborde is about to publish. Independently of its critical value it will be read with pleasure on account of its intelligent and sound method, which is eminently just, and appropriate to the nature of the subject in hand, being equally distinct from the dryness of German matter of fact treatment and from the English mode of chronicling subjective impressions in euphuistic language. The designs reproduced are—the "Judith," engraved by Mocetto; "Saint Sebastian;" "The Virgin and Child;" and the "Entombment," engraved by Mantegna. The subject of this paper is specially the pieces engraved by Mantegna, and M. Delaborde does not enter into any appreciation of the value of the popular attribution to Mantegna of the designs for the Hypnerotomachia Poliphili, the importance of which in its bearing on the history of the architecture of the Renaissance has been estimated once for all by M. Darcel. Two points are specially well touched by M. Delaborde—first, the way in which Mantegna from the first strove to harmonize his archaeological aspirations with the suggestions of his own genius; and, secondly, the predilection he has shown for scenes of violent emotion: it is in treating these that he displays the most profound power of invention. Mere talent is all that he evidences in such subjects as have their chief significance in the sentiment of tenderness, or compassion; whereas in such compositions as either of the Entombments we have the accent of genius.—The remaining articles are—a useful paper on the Musée de Lille (first article), by M. Louis Gonse; a notice of contemporary engraving in the Salon of 1872, by M. René Ménard; a third chapter of the "Correspondence of Léopold Robert," edited by M. Charles Clément; a notice by M. Champfleury on a collection of comic drawings which belonged to Catherine de' Medici; the correspondence of the directors of the French Academy at Rome; the letters of Vien and Natoire (tenth article), edited by M. A. Lecoy de la Marche; Flemish artists of the Renaissance, by M. J. Houdoy.—Amongst the most noteworthy of the illustrations are MM. Lonsay's and Jobert's reproduction of Mantegna's engraving of the "Entombment;" the engraving by M. Gaillard of a bronze bust of Dante in Sir Richard Wallace's collection; and a very graceful and artistic engraving by M<sup>lle</sup> Hélène Boetzel, from a drawing by M. Édouard Frère of "Children leaving School."

The Royal Archaeological Institute met on August 1 at Southampton; the concluding meeting was held on Thursday 8, and the following resolution was unanimously carried:—"That this meeting has heard with deep regret of the projected destruction of 'Caesar's Camp,' near Wimbledon Common, and wishes to represent to the Council of the Institute its earnest desire that they should take such steps as they may think best for the preservation of that ancient historical monument." If we had a Chief Commissioner of Works sufficiently educated to have a proper knowledge of his duties, the task of saving from destruction such an historical monument as this would not be left to the chance zeal of private societies.

The Russian empire has been amongst the most active of those states which have, since the second International Exhibition at London in 1862, turned their attention to the development of industrial art by the means of schools and museums. In 1864 there was opened at Moscow a museum attached to the

Strogonoff School, which had been at work ever since 1860 at the training of designers for manufactures and teachers for schools. Both these institutions are supported by the government: the school receives an allowance of 16,000 silver roubles, and is attended by about 209 pupils. Similar efforts are being made at St. Petersburg. It is proposed to enlarge the schools at St. Petersburg and Moscow, to increase the importance of the Moscow museum, and to place the provincial schools of drawing, together with those of St. Petersburg and Moscow, under one central direction.

The death of M. F. Gillot, which has just taken place at Paris, must not be left without mention. M. Gillot was the inventor of paniconographic engraving, the influence of which on the diffusion of illustrated journals and musical publications can hardly be appreciated too highly. Formerly everything had to be engraved by hand, but M. Gillot, by means of a long sought and carefully perfected method, solved the problem of cheap engraving. Drawings submitted to the action of the acid became in twenty-four hours thoroughly bitten in, so that an immense number of impressions could be taken from them. The works of Doré, Marcellin, Cham, Bertall, have thus been popularised; even the *Gazette des Beaux-Arts* has more than once had recourse to this method.

The first part of the catalogue of the paintings contained in the museum at Madrid has at last appeared. It contains the Italian and Spanish schools. The second instalment is to contain the Flemish, Dutch, German, and French. With the second instalment, the editor, Don Pedro de Madrazo, promises to give to the world facsimiles of all the most interesting signatures to be found on the various works which form this magnificent collection. M. Paul Lefort, in the *Chronique des Arts* for July 20, assures us that this laborious undertaking has been conducted with equal science and sagacity, and fulfils in every respect the most exacting requirements of curiosity and criticism. Don Pedro de Madrazo has patiently analysed the archives of the palace, and the thousand curious details which he has found in them have been condensed into the notes with which he accompanies the description of every picture. In cases where the editor has had (in the absence of any certainty) to choose the most probable attribution, he invariably furnishes the reader with the text of all the documents on which he has founded his conclusions.

The fourth edition of M. Alfred Michiel's *Voyage d'un Amateur en Angleterre* has just been brought out by Renouard. This work has steadily gained in reputation ever since its first appearance.

The well-known artistic glass-painting establishment of M. Maréchal is about to be transferred from Metz to Blois.

Melkshott Court, near Romsey, the seat of Lady Ashburton, has been almost destroyed by fire, which broke out on Friday, August 2. The building is fortunately of recent date, and all the works of art (which were very numerous and valuable), together with the library, were preserved by the energetic exertions of the neighbourhood.

The fourth edition of the catalogue of the collection of portraits, which forms the chief feature of the Dublin Exhibition, is now published. Portraits too form, it is said, the staple of the fine-arts department of the Lyons Exhibition, which was opened July 7. M. de Rayssac remarks, in the *Chronique des Arts*, that there is little or no high art, and an enormous quantity of portraits rarely satisfactory, but, on the other hand, many remarkable landscapes and fine examples of still-life painting. These, he adds, are the usual features of contemporary exhibitions. A gallery for fine arts has also been attached to the Universal Exhibition for Domestic and Industrial Economy, which was opened in the Champs-Élysées, July 28. This exhibition will remain open till November 1.

On Saturday, August 3, the British Museum estimates were presented to Parliament by Mr. Walpole. Mr. Wood's estimate of the sum required for the completion of the excavations of the Temple of Diana at Ephesus amounted, said Mr. Walpole, to

6000*l.* The trustees of the Museum had applied to the Treasury on this subject, and the Chancellor of the Exchequer, "who took the greatest possible interest in these excavations," had at once stated his readiness to grant the sum required by supplementary estimates, 3000*l.* this year, and 3000*l.* next. It may here be mentioned that on the 2nd inst. the lowest drum of the *columna celata* found at Ephesus nearly entire (see *Academy*, vol. iii. p. 285) arrived at the Museum.

Amongst the most notable works of art which have lately changed hands we may specify—Gainsborough's full-length portrait of Sheridan, dated 1783, purchased by Baron Rothschild for 3200*l.*—At the sale of Mr. Curling's collection, by Christie, Manson, and Woods: Webster's "Village Choir," which fetched 766*l.*; Cooper's "Cows and Sheep in landscape," 462*l.*; Herring's "The Start for the Derby," 660 guineas.—At the sale of the Durand-Dubois collection in Paris, M. Charles Nuytner bought on behalf of the Opéra all the old drawings of the decorators and scene-painters Brongniart, Mauro, Ciceri, &c. &c., also two full-length portraits of Fanny Elssler by Deveria. There was a lively competition for a pencil-drawing by Eustache Lorsay of an ex-artiste of the Palais Royal, M<sup>lle</sup> Laure Lambert, who is at present M<sup>me</sup> Émile Augier.—On Thursday, August 6, Sir George Chetwynd's collection of English, Italian, and Anglo-American coins and medals came to the hammer.

A curious musical MS., containing the words and notes of Luther's favourite hymns, collected and arranged for him by his good friend, "Herr Johann Walther, Componist Musice zu Torgau, 1530, dem Gott gnade," has been lately carefully edited and reprinted in facsimile by O. Kade. Apart from the interest which attaches to the exact words, &c. used by the reformer in the domestic concerts of which he was so fond, the publication is of course very interesting to musical antiquarians.

### New Publications.

- AUBERT, E. Trésor de l'Abbaye de saint Maurice d'Agaune. Paris: Morel.
- DIDOT, A. F. Étude sur Jean Cousin, suivie de notices sur Jean Leclerc et Pierre Woëliot. Paris: Didot.
- GALERIE THÉÂTRALE, ou Collection de Portraits en pied des principaux acteurs et actrices français depuis 1552, gravés par les plus célèbres artistes, avec notices biographiques. Paris: Barraud.
- GOBINEAU, le Ch. de. Souvenirs de Voyage. Céphalonie, Naxie et Terre neuve. Paris: Plon.
- HARDWICK, C. Traditions, Superstitions, and Folklore (chiefly Lancashire and the North of England); their affinity to others in widely distributed localities; their Eastern origin and mythical significance. Simpkin and Marshall.
- HITTORFF, S., et ZANTH, L. Architecture antique de la Sicile. Recueil des Monuments de Ségeste et de Sélinonte. Suivi de recherches sur l'origine et le développement de l'architecture religieuse chez les Grecs. (Complément des ouvrages publiés 1826-30.) Paris: Franck.

### Physical Science and Philosophy.

The Introduction of Cultivated Plants and Domestic Animals into Europe. [*Kultuspflanzen und Haustiere in ihrem Uebergang aus Asien nach Griechenland und Italien, sowie in das übrige Europa.* Historisch-linguistische Skizzen von Victor Hehn.] Berlin; Gebrüder Bornmeyers, ed. Eggers, 1870.

MAN's efforts to supply his necessities or multiply his enjoyments, his strivings after "panem et Circenses," may seem to fall as regards the past entirely within the realm of the

historian, and as regards the future within the realm of the politician. But investigators, like other organisms, are mutually interdependent, and investigations regarding "all men's labour under the sun" must be largely biological if they are to be at all complete. For much of all that labour relates to organic nature, its processes admitting of being viewed as the selection, its results as the survival and predominance, of rival forms of life. The work now before us, Herr Victor Hehn's *History of the Introduction of Cultivated Plants and Domestic Animals into Europe*, professes to give us sketches of the history of the subordination of such plants and animals to man's needs so far as literary, that is, historical and linguistic, research can help him towards doing it. This profession, which is made upon the title-page, is fairly carried out in the body of the work; but in justice to the author we may say that he goes beyond his promises, and that the names of de Candolle and Unger amongst modern and those of Theophrastus and Pliny amongst ancient naturalists are to be found amongst his authorities, as well as those of the poets like Homer, and the historians like Herodotus, who give us so much more or less indirect information by making and omitting to make allusions to the natural history of their days. In one word, our author has to deal with an ethnographical and physico-geographical subject, and he has not wholly neglected its physical aspects.

If, after the fashion of a recent writer in the *Contemporary Review*, we take in the first place and as our surest gauge a purely quantitative estimate of Herr Victor Hehn's work, we must say that being but a nineteenth-century octavo of some 450 pages, it contrasts to disadvantage with such a vast and weighty folio as Bochart's *Hierozoicon*, which again, in its turn, must have looked but a pigmy by the side of the "ingens volumen" which Bochart himself speaks of with a shudder (*l. c. ii. 814*) as having been written by a certain Bustamantinus, *de SS. Animalibus*. In all seriousness, however, the subject is a very large one, Herr Hehn speaking himself with great propriety of the literature bearing upon one single department of it as "unermesslich;" and it is all we can or ought to expect if within the limits just specified we have some of the relations which the entire subject has to the history of the progress of our species sketched out, and some of its special concrete examples worked out for us. This the author has done.

In his introductory pages, pp. 3-10, Herr Victor Hehn treats of the large question of the possibility of the restoration of certain of the countries of antiquity, such as Greece, to the condition of fertility which they enjoyed, or are supposed to have enjoyed, in the times of the ancient writers; and he does wisely in siding with Unger in holding that "the thing that hath been, is," or at least, with ordinary care, may be, "the thing that shall be"; and in repudiating the doctrine of necessary decadence and exhaustion embodied in the words *loci senium*, endorsed though it be with the names of Fraas and Curtius. The very simple precaution of preventing the goats from destroying in Greece, as they have all but finished destroying in St. Helena, the forest-trees, by cropping their early buds, would enable the inhabitants to dispense with artificial plantation; and at the same time Herr Hehn points out that the utterances of the ancients are not all unanimously in favour of green fields and purling streams having been the characterizing features of the landscapes they lived in, for that the "woods which cool Ilissus laves" were not planted in what had been previously a bare treeless Attica till the time of Pisistratus (see Dio Chrysostom, *Or. 25*, p. 281 C), and that Plato years after spoke of the Ilissus itself as being but a rivulet, ὄρεον. Sophocles, we may add, would scarcely have devoted so many lines as he has done in the *Oedipus*

*Coloneus*, 668-705, to the description of masses of green foliage, of the trees which composed those masses, and of the nightingales which sang in them, if such a description would have applied with truth to other parts of Greece, or indeed to other *demes* in Attica. It is only after a long sojourn in London, or after a lengthy travel in some such country as Palestine, that green comes, in Sir Francis Palgrave's language, "to comfort the eye and the mind;" and the force of such poetical description as the one we have just referred to was the force which is given by contrast.

H. Hehn notices the alarmist views of the agricultural chemist as to the exhaustion of the soil by the cropbearing to which it has been subjected for now so many successive wasteful generations. These too he sets aside, ascribing the decadence of agriculture in Greece to the non-adoption of scientific methods in the husbandry of the country, which *vera causa* again is the outcome in the last resort of the disadvantage which Greece labours under as compared to Italy owing to the large immigration of Slavonian, Albanian, and Turkish semi-savages, and the insecurity for and the paucity of capital which this calamity has entailed.

Ten pages (10-20) are devoted to a sketch of the condition of things which prevailed in the two peninsulas of Greece and Italy when the first Aryan immigrants (whom he does not suppose with Mr. Fergusson, *Rude-Stone Monuments*, p. 39, to have been "figured under the myth of the return of the Heracleidae") entered it. He draws our attention to the great advantage which accrued to the invaders who penetrated farthest south into the two peninsulæ from the more intimate relations which they were thus able to enter into with the Phœnicians, who in those early days had attained so large a mastery of the arts and inventions which are prerequisites of civilisation.

Three more or less general *résumés* of the conclusions to which his special investigations have led him are to be found in different parts of the book, pp. 314-316, pp. 355-368, and pp. 387-395; but the bulk of the book is made up of accounts, which begin immediately after the sketch of primordial times just alluded to, of the introduction and adaptation to human uses of various plants and animals. Herr Hehn's general surveys and summaries, even when we rank his introductory pages with them, fill up but some forty pages, but they contain a very large number of highly suggestive and thought-awakening general principles which vivify, whilst they help us to colligate, the vast mass of details which some threescore and ten special investigations entail upon his readers. The portentous load of concrete facts which his memory has had to carry has not deprived our author, as it deprives so many men similarly conditioned, of the faculty of graceful and artistic exposition; and the effects of intercourse are shown to have manifested themselves pictorially, or rather to have been measurable picturesquely, by the changes they produced in external organic nature, or, in one word, in the *landscape*, as plainly as, or even more strikingly than, by those other changes which are more usually held to be exact measures of the progress of civilisation. The characters given by the annalists to Tullus and Ancus do not differ more from those given by the historians to Pompey and Lucullus than did the landscape presented by early Italy differ from that of Italy in the first century before our æra. Oaks, limes, beeches, and pines clothed the hill—and indeed the mountain sides of Italy in its pristine days, but these trees had given way to the chestnut, apple, mulberry, cherry, and plum trees of man's introduction, whilst the olive, vine, and fig had occupied the lowlands when Varro (fl. B.C. 116-27) was justified in saying that Italy was so planted with fruit-trees as to look everywhere like an orchard. We doubt, however, whether the Ciminian wood,

which Livy (9, 36) and Florus (1, 12) in their rhetorical language compare with the German and Caledonian forests of their own day, could have coexisted with Etrurian civilisation even in the early periods indicated to us by the legend of the Tarquins; large forests and high civilisation being incompatible. At any rate Herr Hehn, in quoting Livy's words, and Livy in quoting the annalists' words, as to the existence of such a barrier against the march of an army some forty miles northwards of Rome in the year 308 B.C., should have pointed out that they were inconsistent not only with the whole condition of political and military movements described as then prevailing, but also with the account given (Livy v. 32) of Roman armies and their expeditions nearly a century previously. But we would also remark that the postdating of the persistence of the forest with all its characters of "invia atque horrenda" into the days of Papirius and Fabius shows that the early annalists must have dwelt upon those characters with considerable force and iteration in telling or distorting the legends, which we suppose to have really belonged to those far earlier times in which Tuscan power was yet but half developed, whilst Rome existed but in the embryo form of a small community tolerated in semi-independence partly on account of its insignificance, partly on account of the isolation which the legend, speaking so strikingly of the existence of woods, shows us that woods may have secured for it. We should also demur to Herr Hehn's ranking the Etrurians with the Indo-Europeans (p. 15), and to accepting the legend of their entrance into Italy having taken place from the north, and should use his own elegant analogy drawn (p. 389) from the fact that our best fruit-trees are the result of the engrafting of Oriental branches upon Western stocks to express the relation which was really held by the complex result of Roman culture to Etrurian and indigenous factors respectively.

Herr Hehn has well pointed out (p. 359) how ruinously one of the most prominent doctrines of the political economy of the old world, expressed by Cato in the words, "quae nasci in fundo ac fieri a domesticis poterunt, eorum ne quid ematur," or, he might have added, in the still older and equally foolish aspiration of Dicaeopolis (Aristoph. *Acharn.* 35), for the country where ὁ πρῶτον ἀπὸ τῆς, operated on the mechanical arts by checking the development of trades within the cities. But according to our author there was at work a deeper cause than even the non-recognition of the principle of division of labour to account for the stationary character of the mechanical arts among the ancients. They had, according to him (pp. 359, 360), no aptitude for the study of natural phenomena, living as they did in an ideal world, given up, as aristocratic castes are often given up, to the enjoyment of the artistic instead of to the pursuit of the real. But that he is wrong, at least from an aetiological point of view, when he says (p. 367) that what differentiates the modern from the ancient world is natural science, the arts, and political economy, as also when he says (p. 360) that the ancients lived immersed in dreams of religious fancy, and when he suggests (p. 361) that the evil influence of slavery (and the latifund system connected with it) may have been overrated, will be allowed by most persons. Again, it may be true enough (see p. 362) that the spirit of Christianity opposed itself to the Roman spirit of war, and that it was also so alien from the spirit of Roman law, in the codification of which the last manifestations of intellectual life under the empire were exhausted, that the name of scarcely one of the great Roman jurists can be pointed out as being that of a Christian, and that thus law and war, the two chief pillars of the Roman economy, were undermined by the new religion. But our author is at variance not only with himself, but also with the facts, when he hints that

the new religion was at all more opposed to the spirit of natural science than the mind of the old world had shown itself to be, and the remains of Pompeii, where want of comfort, where imperfection of apparatus and poverty of instruments are so strangely noticeable side by side with works of unquestionable artistic beauty, if not always of unquestionable taste, testify to this at the present day, as he himself remarks (see p. 360). H. Hehn, again, is only right to a certain extent in insisting (pp. 358, 359) that much of all the good which might have accrued from the road-making of the Romans was neutralised so far as purposes of commerce and trade were concerned by the imposition of heavy tolls upon traffic, by their system of monopolies, and by their prohibitory tariffs. For if we take, as our author insists we should take, the history of the introduction of domestic plants and animals as a measure of the freedom of intercourse existing at various periods in the civilised and semi-civilised world, the history of such a plant as the cherry which spread in the 120 years which elapsed between the period of Lucullus' Mithridatic war and the time of Pliny into Spain, Belgium, and England, must be taken as indicating the existence of a tolerably free system of interchange and of intercourse. The chestnut, again, another stranger from Pontus, must have spread with even greater rapidity, as Amaryllis, who lived, in imagination, a considerable time before Pliny, was acquainted with and indeed (see Vergil, *Æd.* ii. 52) not insensible to its merits. The parable of Jotham (Judges ix.), which H. Hehn assures us is now very little read, and which he consequently is kind enough to translate in full for his readers, shows us that the fig, vine, and olive were, at an early period, "dwellers in Mesopotamia and Judaea"; and though they were at a disadvantage as compared with the more hardy northward ranging plants just mentioned, which came, together with "nuts and almonds," from the Armenian region, they still had established themselves on the western shores of Italy before the period of authentic history. For in the legends the fig shelters Romulus and Remus and their she-wolf nurse; and though the law ascribed to Numa, and forbidding the use of wine for sacrificial purposes (p. 27), may seem to show that this "demoniacal drink," as Hehn calls it (*l. c.*), was looked upon in early Italian times as metal knives were looked upon by Zipporah, viz. as something too novel to be used in religious rites, still the legend does prove that wine was known at an early period in Italy, and at how early a period we can only guess, as the priests, especially if they looked upon wine as our author appears to look upon it, may have thought that no lapse of time would qualify such an invention for employment in their rites and ceremonies. The words, thirdly, of the old annalist, Fenestella, preserved for us by Pliny (*N. H.* 15, 1, 1), as they connect the date of the introduction of the olive with the name of Tarquinius Priscus, and so with the period of Etrurian influence, complete the chain of evidence; and we may further remark that, well suited to and indeed now even distinctively characteristic of the Mediterranean region though the olive be (Grisebach, *Die Vegetation der Erde*, i. 244), there can be no doubt that it was introduced into and not indigenous in Italy, and that its title, "bacca Sabina," shows therefore that this introduction took place at a period to which the memory of men reached not back, at least in the days of Juvenal. The peach (*Amygdalus persica*) and the apricot (*Prunus armeniaca*), coming from the parts of Asia which their scientific names denote, did not establish themselves in Italy till the first century of our aera, and we find no mention of them made in any writer of the Augustan age. It was left to the Moors and Crusaders to introduce the lemon, and, according to Hehn (p. 331), to the

Portuguese to introduce the orange, the "China orange" of some English writers, and the "Apfelsine" of the Germans, into Europe about the year 1548. The linguistic evidence for the introduction of the orange by the Portuguese may seem singularly complete, the modern Greeks calling the fruit *πορτογαλέα*, the Albanians *protokale*, the Italians *portogallo*, and, most striking of all, the Kurds *pottoghal* (Pott. *Zeitschrift für Kunde des Morgenlands*, 7, 113). But de Candolle (*Géographie bot.* 868) is of opinion that here, as in a good many other cases, reputation is in inverse ratio of desert, and that the orange, introduced from China at a comparatively recent period into India, was carried thence into Europe by the agency of the Arabs, Genoese, and Venetians some twenty-five years earlier than the date assigned by Herr Hehn.

If we lay aside the consideration of these somewhat small questions of priority, and look at the large-scale relations which have subsisted between India and China on the one hand, and Europe on the other, we shall note that, two thousand five hundred years before the days of Vasco de Gama, Solomon and Hiram contrived to introduce apes and peacocks into Palestine from India, and that with the exception of the sugar-cane, introduced, like the fiddle and the organ, by the Arabs, and the buffalo, Europe gained scarcely anything from India in the long period just mentioned. Surely the nations who extinguished Tyre, Sidon, and Carthage, must have been as much inferior to the Phœnician races in navigation and maritime enterprise as they proved themselves to be superior in military skill. What would Pytheas have thought if he had been able to foresee that Ireland would remain as little known to the Roman occupiers of Great Britain as New Guinea is now to the Anglo-Saxon and Celtic occupiers of Australia? How Pliny ought to have blushed for his countrymen when he had to confess that his knowledge of the Canary Islands had come to him but secondhand from King Juba! Herr Hehn says (p. 366) that the Roman empire might have been saved if it had been possessed of gunpowder, wherewith to keep back the barbarians, and of paper, upon which the entirety of Greek and Roman literature, including, we suppose, the writings of Crispinus, Fannius, and Tzetzes, might have been preserved, for use, we may suggest, in our public schools. But with the instances just given of the inaptitude for improvement, and of the slowness to exert itself for the benefit of mankind which the Roman empire manifested after it attained its definite establishment, we think mankind is perhaps to be congratulated upon the retardation of the invention of two commodities which might have secured a still longer tenure of power to the Italian mistress of the world.

It would be impossible, within the limits, we will not say of one or of two articles, but of very many articles of ordinary length, to follow Herr Victor Hehn through each of the detailed investigations into the history of our now familiar domestic animals and cultivated plants with which he has favoured us. There are about seventy of these histories, each one of which would furnish a large mass of matter for discussion; and the author goes beyond his undertaking as signified in his title-page, and adds to these old-world histories much that is interesting with reference to our obligations to America and her contributions to the landscapes and dietaries of modern Europe and Asia. He enumerates, and rightly, the Indian fig, the agave, and the Occidental plane, together with the potato, the tomato, and the tobacco-plant, but, whilst omitting the fuchsias, he adds to his list (p. 385) the Lombardy poplar (*Populus dilatata*), to which no American has, we imagine, since the time of the elder Michaux, made either direct or indirect claims. If men of science, who are, as Mr. Ayrton rejoices to think, but a

small minority of mankind, demur to this statement, the immense majority of mankind (who are not scientific) will demur to another made upon the next page, where our author discharges a copious vocabulary of abuse upon the habit of smoking tobacco. He calls it upon that single page (p. 386) a barbarous custom, "ein barbarischer Gebrauch," and a hateful habit, "eine hässliche Gewohnheit," and this so-called "fragrant weed" itself he styles a kind of poisonous nightshade, "eine Species giftigen Nachtschattens." In days when an attorney-general has been howled at by an untruth-loving multitude because he had called things by their proper names, we may mention with praise the wholesome habit which our author has of expressing his likes and dislikes in plain language; and if any of our readers are curious or anxious to know what Herr Hehn's feelings are towards Turks, Magyars, and Slaves, we may refer them to pp. 10, 364, and 425, where, whatever else they may object to, they will not have to object to any want of outspokenness.

A little more respect, however, for ancient literature, if for nothing else, might have saved our author from one of the few mistakes into which he has fallen, and would have prevented him from going out of his way (p. 181 and p. 435) and beyond both his authorities and the facts themselves to attack the correctness of the passages in Genesis xii. 16 and Exodus ix. 3, in which the camel is spoken of as being used in Egypt in the times of Abraham and of Moses. It is well known that Desmoulins long ago proved (*Mémoires du Muséum*, tom. x. p. 221, 1823), so far as literary evidence can prove such a point, that the camel was not largely used in Africa west of Egypt till a much later period in the world's history than the one we have referred to, but Desmoulins himself accepts the accuracy of the statements in the Pentateuch, and gives it as the result of his enquiry that Arabia, a country conterminous with Egypt, and Persia are the native region of the dromedary. But further, Mr. Horner (*Philosophical Transactions*, 1858, p. 59; cf. Lyell's *Antiquity of Man*, p. 35) and Lieutenant Newbold (*Proceedings of the Geological Society*, 1842, vol. iii.) have dug up dromedaries' bones in various deposits, alluvial and marine, in the Delta and on the west coast of the Red Sea respectively. We take this opportunity of saying that very strong evidence may be brought forward for the early and usually accepted dates of the books of the Old Testament in the same way as is done for those of the genuine Homeric poems, from the allusions they make to the plants and animals with which man is represented as coming into contact; and that this evidence may be brought out strikingly by a comparison of the real renderings of the Hebrew names of these animals and plants with the renderings given by St. Jerome, who learnt Hebrew only in middle life, and then assuredly imperfectly. The common fowl, for example, a bird the mention of which by the writer of the *Batrachomyomachia* proves him, as Payne Knight long ago observed (*Prolegomena*, vi.), to have been of a later than the Homeric age, finds a place some twelve times in the Vulgate as *Gallus gallinaceus*, though nowhere in our more correct version; and the tiger is found occupying in the former of those versions a place which in the latter is occupied, as in fact it only could have been, by the lion. Whatever such blunders as these may make us think of the learning (for learning alone, as distinguished from science, would have been sufficient to prevent the commission of them) of the early father in question, the fact that they are blunders, committed by him, and not by the writers whom he undertook to translate, is one which we commend to the serious consideration of H. Hehn as speaking somewhat plainly in favour both of the authenticity and of the authority of the writings which he sets aside so cavalierly.

In the two last pages of his text, H. Hehn has some remarks upon the numerical predominance which dark hair is gradually obtaining over light hair in the world as we now see it, and as this subject is of great ethnological and (if we may argue from the attempt of the late eminent theologian, Chr. H. Weisse [*Psychologie und Unsterblichkeitslehre*, p. 311], to correlate the colour of the hair and eyes with variations of our mental and moral nature) of even higher interest, we must point out a few particulars in which our author has fallen short either of completeness or of correctness. Firstly, Herr Hehn would have been liable to the charge of hastiness for arguing that the Scythians and Thracians of antiquity were dark-haired, because the Greeks and Romans, themselves a dark-haired race, would otherwise have stated that these two races differed from them in this particular. Secondly, as a matter of fact, the ancient Greek and Roman writers are not silent upon the matter; but when they do speak of it, they say exactly the reverse of what our author anticipates they would have said. Sidonius Apollinaris, in his *Panegyric on Majorian*, as also elsewhere, may not be taken as an undeniable authority, still the words, l. 218—

"Scythicisque choreis  
Nubebat flavo similis nova nupta marito"—

count for something, and, when coupled with those of Clemens Alexandrinus (*Paedag.* iii. 3)—τῶν Ἑθνῶν οἱ Κεῖλοι καὶ οἱ Σκύθαι κομῶσιν, ἀλλ' οὐ κοσμοῦνται (κομμοῦνται, see Cobet :) ἔχει τι φοβερὸν τὸ εὐτρίχον τοῦ βαρβάρου καὶ τὸ ξανθὸν αὐτοῦ πόλεμον ἀπειλεῖ—they carry some weight. Galen, however, in his treatise *Περὶ Κράσεων*, ii. p. 627 (vol. i. ed. Kuhn), classes "the whole Thracian and Scythian race" with the Celts and Germans on account of their resemblance to them in this very particular of the hair. Though, as Dr. Beddoe, to whom we owe this last reference, has remarked, there is no subject upon which statements are so likely to be misleading and erroneous as statements made by any but good observers provided with standards of comparison, upon differences in complexion and colour of hair, we nevertheless believe that Herr Hehn is right in thinking that dark hair is becoming more and light less common in our own latitude and day as it always has been in Italy, and we think there is good evidence for this which his particular line of research should have drawn his attention to. Herr Hehn has in several places noted the singular fact that the useful invention of soap was due to the Northern and only adopted (and we may add, sparingly) by the Mediterranean races of Europe. He has not mentioned the fact that in many passages referring to this commodity it is said to have been employed "rutilandis capillis," for the procuring that flaxen-coloured coiffure which was fashionable in the later times of the Roman republic and under the empire, as it is at present in England. "Prodest et sapo," says Pliny, "Galliarum hoc inventum rutilandis capillis ex sevo et cinere." The Roman matrons, however, had employed wood ashes, the really efficient agent in the compound just mentioned, for this purpose long before Julius Caesar had subjugated the Gauls; for Valerius (ii. 1), writing in the time of Sulla, tells us that they "summa diligentia capillos cinere rutilabant." And light hair continued to be the fashionable, and, we submit, therefore, the less common, colour of hair down to the time of Tertullian at least; for he in his work *De Cultu* indulges in some ghastly mirth as to the evil omen which a flame-coloured head of hair might be taken to be as to the future life of the wearers who had taken so much pains to win it. The argument, that, if light hair is a thing which is fashionable, and for the procuring of which pains and trouble are laid out, it may be safely taken to be a scarcer thing than its opposite, will apply to the present day and to its

parallelism with the other centuries of which we have been writing.

English ladies who have hair of their own, though of the wrong colour, buy washes to make that colour "auricomous," "regardless of expense," as indeed they well might be if these washes, containing ordinarily simply nothing beyond chloride of lime, were priced at any price less than a thousandfold their intrinsic value; and to them Martial's line, xiv. 23—

"Caustica Teutonicos accendit spuma capillos"—

applies curiously. English ladies who have not sufficient hair of their own buy the natural hair of German women now as in the days when Ovid wrote—

"Jam tibi captivos mittit Germania crines,  
Culta triumphatae munere gentis eris."

What was written in the time of Arminius and Varus will apply to the time of Moltke and MacMahon; Mr. Hulke, one of the surgeons to the Moorfields Ophthalmic Hospital, informing me that it is an ordinary thing to find the German female patients at that celebrated institution wearing wigs, their own hair being sold and doing duty at the opposite end of London. It may be said that these are but coincidences, curious and close enough, it is true, but merely coincidences for all that. To this it may be replied that a plague-spot is merely a coincidence also, but that it has its significance as relating to conditions which are more than skin-deep. Let our readers lay alongside of such a description of the dazzling and squandering season of 1872 as appeared in the *Daily News* of Monday, July 22, and of Mr. Gladstone's boast as to the "leaps and bounds" which our prosperity is making, Livy's description of the life and manners of Rome in the "seasons," with which he was only too familiar. It will be found in his *Praefatio*; a few words for it may end this article—"Nuper divitiae avaritiam et abundantes voluptates desiderium per luxum atque libidinem pereundi perdendique omnia invexere." G. ROLLESTON.

**The Philosophy of Shaftesbury.** [*Die Philosophie des Grafen von Shaftesbury.* Nebst Einleitung und Kritik. Von Dr. Gideon Spicker, Privatdocent an der Universität Freiburg.]

DR. SPICKER'S book consists of a historical study rather singularly sandwiched between two expositions of the author's views on theology and philosophy: for though these latter are termed respectively "Einleitung" and "Kritik," they have scarcely the shadow of a relation to the central portion of the treatise. The connection suggested in the preface is that Dr. Spicker has taken Shaftesbury as his "Vorbild" both in matter and in form. But, in fact, it is hard to say whether there is a greater contrast between Shaftesbury's effort to establish rationalism as the crown and culmination of philosophic morality and Dr. Spicker's conviction that reason and religion have nothing to do with each other: or between the urbane irony and serene contemplation of the peer and the inconsiderate violence, grotesque humour, and emphatic indecorum of the Privatdocent. It is hinted that Shaftesbury, like Shakespeare, requires a German interpreter in order that his merits may be duly recognised by his fellow-countrymen; and no doubt a certain disposition to depreciate him may be found in other writers besides Mr. Lecky, whom Dr. Spicker quotes. On the other hand, our author is apparently unacquainted with Mr. Hatch's elaborate edition, in which Shaftesbury's opinions on all subjects are treated with the most serious and respectful commentation; more so, indeed, than the polished essayist sometimes deserves or would have desired. However, even supposing that the fame of Shaftesbury needed rehabilitation, Dr. Spicker does not seem particularly well qualified for the task.

He is not sufficiently acquainted with English philosophy to exhibit the originality and importance of Shaftesbury's ethical views; while the theological portion of his author's work he seriously misrepresents by rendering it in his own very different temper. A writer who claims (in the *Miscellanies*) that he has always "forborne to mention any holy mystery of our religion or any article of our faith" would scarcely approve of an expositor who metamorphosed his elegant innuendo into a direct and violent attack on Christianity, by the simple process of leaving out the irony which is the most entertaining and characteristic quality of his style. Sometimes Dr. Spicker vulgarises this into coarse sarcasm; sometimes he does not seem to have caught it at all. For example, he seems to take quite seriously Shaftesbury's reference (while advocating good humour in religion) to the "playsom humour" of David, as exhibited in the "famous high dance" performed by him in a state—as he carefully notes—of nearly complete nudity. Apart from the carefully studied and artistically effective expression, Shaftesbury's criticism of historical religion is scarcely worthy of much consideration at the present time. His knowledge was not extensive or profound, and his application of it shows all the unhistorical intolerance of the eighteenth century; as even Dr. Spicker sees, in spite of the vehement unfairness of his own anti-Christian polemic.

And generally speaking, though Shaftesbury's importance in the evolution of English ethical thought is very great, on other subjects he hardly fills the place that his expositor assigns to him. His philosophical talent was considerable, but its development was checked by his continual dread of losing the gentleman in the philosopher. A theory of practice, he thought, the most rigid rules of good taste and cultivated sense could not forbid; but in the purely speculative region, though he showed himself acute enough in casual criticisms, he was restrained from any serious pursuit of truth by his gentlemanly-practical contempt for the absurdities of metaphysical pedants. Thus it seems extravagant to speak of Shaftesbury and Leibnitz as *co-discoverers* of Optimism: as if Optimism remained to be discovered in the eighteenth century, and as if there could be any comparison between the loose effusions of the "Moralists" and the elaborate and ingenious reasoning of the *Theodicee*. And there is a similar inappropriateness in the following account of the Letter to Somers on "Enthusiasm":—

"Seit Plato, an den er sich unmittelbar anschliesst, hat keiner diese Leidenschaft so klar und gründlich erfasst und ihr eigenes Wesen durch eine Fülle von Thatsachen aus der Geschichte und Erfahrung entwickelt und bewiesen. Nicht umsonst hat er dieses Schriftstück . . . als Programm und Einleitung an die Spitze seiner Werke gestellt. Denn Moral, Kunst, Religion u. s. w. leitet er aus dieser Leidenschaft ab," &c.

Now Shaftesbury himself says of this composition, "The author cared not to grapple closely with his subject, nor to give us at once the precise definition of enthusiasm." And, indeed, here he does not appear exactly as a defender of enthusiasm: but rather as mediating between religious enthusiasts and polite society, which regarded their fanaticism as a malady needing severe treatment. He is chiefly concerned to impress on Somers and the public that a free play of raillery is the proper cure for this disease. Elsewhere no doubt he advocates more decidedly such temperate enthusiasm for beauty and virtue as he finds to be sanctioned by good taste and not incompatible with the character of a gentleman: nor would he exclude this exaltation from religion, provided its object be such a Supreme Being as a polite person in good humour feels himself disposed to recognise. But the resemblance between this attitude of mind and that of Plato is scarcely so close as either he or his expositor appears to think.

H. SIDGWICK.

## Notes and Intelligence.

### Geology.

**The Glaciation of Patagonia.**—Prof. Agassiz has forwarded to the superintendent of the U. S. Coast Survey a second report of the expedition in the U. S. steamer *Hassler*, of which he has the command. A great number of observations of very great value and interest are detailed in it, among others, a large mass of evidence supporting the theory of the glaciation of Patagonia. In one locality he found a pool containing live marine shells more than 100 feet above the level of the sea, showing a very recent rise in the land. He is inclined, however, to believe that the level terraces which Darwin took for raised sea-beaches are not so in reality, but are the denuded surfaces of the horizontal Tertiary deposits. The only evidences of upheaval met with by Agassiz refer to a period since the deposition of the Tertiaries, and while the shells now living already existed, without pointing to a rise by successive steps. The report is printed in full in the number of *Nature* for 11th July *et seq.*

**Fossil Wood from the Lower Eocene of Herne Bay.**—*The Geological Magazine*, No. 96, opens with an interesting article by Prof. Dyer on the fossil woods of the Lower Eocene of Herne Bay and the Isle of Thanet. The author describes and figures the microscopic features of the wood of a dicotyledonous tree, which exhibits the peculiar structure known under the name of *Fylose*.

**Fossil Footprints in the Carboniferous Series of Canada.**—In the same periodical, Mr. Selwyn, the director of the Geological Survey of Canada, notices the occurrence of some fine fossil footprints in a stratum of dark shale belonging to the Carboniferous series of Nova Scotia. These footprints are described and figured by Principal Dawson, who finds the principal footprints to be of two kinds: a large one resembling the form described by him as *Sauropus Sydnensis*, but having a strong claw on the fifth toe of the hind foot, that has left its mark strongly impressed upon the slab; and a smaller impression, sometimes trifid, but occasionally showing the marks of four or five toes. The former, which has been named *Sauropus unguifer*, he thinks may have been produced by *Baphetes planiceps*, the latter perhaps by a species of *Dendroteropon*.

**The Sand-pits, Mud-volcanoes, and Brine-pits of Yarkand.**—At the meeting of the Geological Society on the 5th June, Dr. G. Henderson described some remarkable circular pits, occurring chiefly in the valley of the Karakash river. These pits vary in diameter from six to eight feet, and are from two to three feet deep, the distances between being about the same as it is across them. He explains their formation by supposing that water permeates the gravel at the head of the valley, and passes under a stratum of clay, which prevents it regaining the surface; after flowing in very varying quantities for irregular periods, it at length gradually washes away small portions of this clayey band, while the sand above runs through into the cavities thus formed, and produces the pits described. The mud-volcanoes of Tare Dab he considers to arise from the air contained in the water-bearing stratum after a fall of rain or snow becoming churned up with water and mud; it is ejected as a frothy mud, sometimes to a height of three feet. The brine-pits in the Karakash valley he attributes to the excessive rise and fall of the level of that river at various times; the water which fills the pits, unless replenished from time to time, becomes gradually concentrated by evaporation till a strong brine remains.

**The Cambrian and Silurian Rocks of Jemtland.**—The chief Silurian area in Sweden lies in the neighbourhood of Lake Storsjön, in Jemtland, and covers no less than 1920 geographical square miles. Dr. G. Linnarsson, of the Geological Survey of Sweden, describes this region in the *Geol. Fören. i Stockholm Förhandl.* vol. i. p. 34, and notes the striking fact, that the eastern and the western extensions of the Silurian formation of Jemtland exhibit a great lithological and consequently also a palaeontological difference. At places where limestones are prevalent, organic remains abound, and a comparison with strata of other parts of Sweden is consequently easy; but in the western extension of the Silurian rocks clay slates predominate which are utterly bare of fossils, so that it was only by means of a thin seam of limestone which bears Middle Silurian fossils he was able to trace the relationship with the other Cambrian and Silurian rocks. As regards their palaeontological characters, the Jemtland rocks bear a nearer relationship to the Norwegian than to the South Swedish Silurian formations. At several places large masses of metamorphic schist rest on the Silurian beds, but as they have not yet yielded any traces of fossils, their true relative age has not been ascertained.

**The Fossils of the Cambrian Rocks of Oeland.**—The Cambrian beds of West Gothland consist of sandstone and the so-called alum slate. According to Angelin and Linnarsson, the latter is characterized by two distinct faunas: the lower by *Paradoxides* and *Conocoryphe* species, and the upper chiefly contains *Olenides*. Up to the present time it was believed that in Oeland only the upper zone with *Olenides* was represented, but A. Sjögren has found below this stratum beds

which represent the lower division of the West Gothland alum shale, though differing in lithological character. It is a remarkable fact that this deposit, which has yielded several new species, is more nearly allied to the Bohemian primordial zone than to the rest of the Cambrian rocks of Sweden. (*Geologiska Föreningens i Stockholm Förhandlingar*, vol. i. p. 67.)

**Geological Profile of the Central Chain of Scandinavia between Östersund, Sweden, and Levanger, Norway.**—The rocks along this line are classified by A. E. Törnebohm according to their relative age in the following manner:—1. Primitive rocks and old granite. 2. Slate of Levanger and Cambrian quartzite. 3. Silurian beds; and 4. For the most part crystalline shales without fossils. These are of uncertain age, but they are probably not older than the Upper Silurian. (*Sveriges Geologiska Undersökning*, Stockholm, 1872, p. 24.)

**Coniferous Remains from Solenhofen.**—The *Geological Magazine*, No. 95, contains a paper by Prof. Dyer, in continuation of a former one on the same subject, on some remains of Conifers from the lithographic stone of Solenhofen. He describes a new species of *Pinus* (*P. Solenhofensis*), and gives a revision of the genus *Athrotaxites*, with description of two new species (*A. longirameis* and *A. laxus*), and a notice of a new genus, *Condylites*, probably belonging to the Cupressineae, and including a single new species, *C. squamatus*.

**Flint Implements associated with *Elephas primigenius* in the High-terrace Gravels of the Thames Valley.**—At the meeting of the Geological Society of London on the 19th June, Col. Lane Fox read a paper on the discovery of several flint implements which he found in association with *Elephas primigenius* and other extinct species of Mammalia. The author called attention to the presence of drift implements in the high terrace, their absence in the mid terrace, and their reappearance in the existing bed of the Thames; and noticed the great rarity or absence of animal remains in the high terrace, their abundance in the mid terrace, and the occurrence of both implements and animal remains at the bottom of the gravel in both terraces.

**The Clay Deposits near Campbeltown.**—Mr. David Robertson, at a recent meeting of the Geological Society of Glasgow, read a paper on the boulder-clay section near Campbeltown, which, contrary to its usual position in the west of Scotland, here overlies shell-bearing clay. The latter is dark grey in colour, and contrasts strongly with the overlying boulder clay, which is of a full reddish brown. The shell-bearing clay, as exposed in the bed of a little burn or streamlet in Tangy Glen, about six miles from Campbeltown, is seen standing up in the boulder clay like a little knoll, and has doubtless been brought to that form by abrasion. It can be traced for a distance of 60 or 70 yards; and though its exact depth could not be ascertained, as the rock is seen at a short distance on either hand, it probably extends only a few feet below that which is exposed. The boulder clay overlies it to a height of 50 or 60 feet. The latter consists of 50 per cent. of fine mud and 50 per cent. of sand and gravel, while the shell-bearing clay gives 80 per cent. of fine mud and only 20 per cent. of sand and gravel. The fossils are sparsely scattered through this deposit.—Molluscs in particular are comparatively rare, the few found being chiefly *Leda pygmaea* with an occasional *Leda pernula* and a few fragments of other species. Ostracoda and Foraminifera are better represented, eighteen species of the former and twenty-six of the latter having been obtained. A remarkable feature of the Ostracoda in this deposit is that they have much in common with those found in the clays on the east coast of Scotland, which have been held to represent more purely Arctic types than those generally found in the west. Amongst these are *Cythereopecton Montrosiense*, *C. vespertilio*, *C. Sorbyana*. An upper bed, dipping to the river only, contains the more recent forms common to our raised beaches and present seas. It may be stated that *C. vespertilio* and *C. Sorbyana* are common species in the clays of Norway.

**The Structure of the Cordillera de los Andes.**—Dr. Maack, who was in charge of an expedition to explore the Isthmus of Darien in order to ascertain whether the Napipi road would offer advantages for an inter-oceanic canal, has found that the Cordillera de los Andes province of Chocó, New Granada, has features which distinguish it from the rest of the range. Throughout the whole of South America the general strike is from south to north, but in this province it changes to from east to west. The Cordillera of the isthmus consists of several rock systems; no high and wide tableland accompanies it as has been observed in the South and Central American Cordilleras, and it belongs altogether to a far more recent period, being contemporaneous in short with the eruption of basalt and trachyte. (*Boston Daily Advertiser*, 4th Nov. 1871.)

**The Geology of the Argentine Republic.**—According to Dr. G. A. Maack, the great La Plata plain chiefly consists along its western border of alluvial deposits from one to two feet in thickness, and generally formed of a fine brown or grey silt "Pampa sand," made up for the most part of Diatomaceae, and in the neighbourhood of rivers some still living freshwater shells. This covers the diluvium, the real Pampas formation ("formation pampeña" of d'Orb. "Pampean mud" of Darwin). More or less red in colour, and attaining a thickness of

10 to 60 feet, it consists of sand and clay and in some parts limestone in so-called "Tosca concretions," and is remarkable for its "Lagunas" or "Salinas," and the gigantic remains of *Megatherium*, *Myloodon*, *Glyptodon*, *Toxodon*, &c. The basis of this Pampas deposit is formed by Tertiary beds, which d'Orbigny divided into a *système guaranien* and *système patagonien*. To the former may belong the lignite beds of Rio grande do Sul, in Brazil. The latter group is best developed in the neighbourhood of Paraná, and near Vitoras, in Uruguay; its chief fossils are *Venus Münsteri* and *Ostrea patagonica*; and the formation may be ranked beside the Swiss molasse. Tertiary beds are found at a depth of 280 feet at Buenos Ayres, whence they seem to extend right away to the base of the Cordilleras. Other sedimentary rocks are unknown in the Pampas, though the older Plutonic rocks are met with at isolated spots. (*Proc. Boston Nat. Hist. Soc.* vol. xiii. 417.)

### Zoology.

We have received three parts (Nos. 4-6) of the *Illustrated Catalogue of the Museum of Comparative Zoology at Harvard College*:—No. 4 is intitled "Deep-Sea Corals," by L. F. de Pourtales (pp. 93, with eight plates). The corals described in this paper were collected in the years 1867-9, during the expeditions made by the United States Coast Survey for the exploration of the Gulf Stream, and more particularly that part of its course known as the Straits of Florida. The greatest depth at which the dredge appears to have been used is 853 fathoms, between Key West and Havana. The families having apparently the greatest range in depth are the *Oculinidae*, *Stylasteridae*, and *Milleporidae*, and about fifteen species are considered to be characteristic of the rocky bottom at greater depths than 100 fathoms. The explorers found, moreover, that the Gulf Stream, as far, that is to say, as they examined it, extends to the bottom, and is not underlaid by a cold arctic current running in an opposite direction, as has sometimes been assumed to account for the low temperature at the bottom. Mr. H. Mitchell, assistant on the United States Coast Survey, proved experimentally that the Gulf Stream has a nearly uniform velocity in those straits, and a constant course for a depth of 600 fathoms, although its temperature varies 40° Fahrenheit in this depth.—No. 5 is intitled "The Immature State of the *Odonata* (Part I.: Sub-Family *Gomphina*)," by L. Cabot (pp. 17, with three plates). The larvae of seventeen species are described, but only four are identified and placed beyond any doubt; all the others are determined by exclusion or supposition, and some of them more or less doubtful.—No. 6 is a "Supplement to the *Ophiuridae* and *Astrophytidae*," by Th. Lyman (pp. 18, with two plates), in which some of the Ophiurians procured by deep-sea dredging in the Straits of Florida, as well as a few other species from shallow water, are described.

***Syrtaptes paradoxus* in Scotland.**—This remarkable Asiatic bird, a sudden irruption of which occurred in Germany, Holland, and more particularly in Great Britain during 1863, and which is commonly known by the name of Pallas's Sand-grouse, has made its appearance again this year, four of them having been seen on the 25th and 29th of last month near Girvan, in the west of Scotland. It is at present uncertain whether these birds are fresh arrivals or descendants of the individuals which immigrated in a previous year.

**Two New Sponges from the Philippine Islands.**—The British Museum has just received two new genera of Sponges that were discovered by Dr. A. Bernhard Meyer at Cebu, the island in the neighbourhood of which the beautiful *Euplectella* occurs. One of these sponges, named by Dr. Gray *Meyerina claviformis*, is, indeed, allied to, but still more beautiful than, *Euplectella*; it is 18 inches long, in shape like a cucumber, is slightly bent upon itself, and, whether regarded in its several parts or its entirety, must unquestionably be ranked as the most exquisite of sponges. The second, named by Dr. Gray *Crateromorpha Meyer*, is of very different form, being goblet-shaped, and consisting of a globular, hollow body supported by a contracted stem. The globular part is 3½ inches wide, and the stem 3¼ inches long. Both these sponges are marine, and grow erect in sandy mud. (*Ann. and Mag. Nat. Hist.* July and August.)

**The First Dredge.**—To Otto Friedrich Müller belongs the honour of having invented the dredge. The Zoological Museum at Cambridge, U.S., possesses in its library the copy of Müller's *Zoologia Danica* used by Tilesius during Krusenstern's voyage round the world in the beginning of this century. Tilesius, among many interesting remarks written on the fly-leaf, mentions the dredge invented and used by Müller, and represented in the vignette of the title-page. He purchased it on his passage to Copenhagen in 1803 of Vahl, Müller's collaborateur, and used it occasionally during the voyage, though, as he admits, not often, as he required the assistance of several sailors to work it, the rope alone weighing eighty pounds. On his return, the dredge was deposited in the collection of the Academy of Sciences of St. Petersburg.

**The Colours of Insects.**—Under the heading of "Mimicry in the Colours of Insects," Dr. H. Hagen contributes a very interesting paper

to the July number of the *American Naturalist*. He states that the colours of insects are of three distinct kinds, viz. colours produced by interference of light, colours of the epidermis, and colours of the hypodermis. Colours due to interference may be produced in two different ways: either by thin superposed lamellae, as in the wings of Diptera and Neuroptera, or by many very fine lines or striae in very near juxtaposition, as in *Apatura* and other colour-changing insects; these colours are only optical phenomena, and differ in this respect from both of the other kinds. The epidermal colours belong to the pigment deposited in the cells of the chitinated external skin or epidermis. They are mostly metallic blue, green, bronze, golden, silver, black, brown, and perhaps more rarely red. They are very easily recognised, being persistent and never obliterated or changed after death. The hypodermal colours are situated in the non-chitinated and soft layer called the hypodermis by Weismann. They are mostly brighter and lighter, light blue or green, yellow, milk-white, orange, and all the shades between. The hypodermal colours in the body of the insects fade or change, or are obliterated after death. The hypodermal colours are very often different in males and females of the same species; the epidermal colours rarely differ. The hypodermal colours may change or be altered in some way in a male or female during its lifetime by sexual or other influences; the epidermal colours never change; the so-called "mimetic" colours are probably hypodermal. The hypodermal colours appear to be due to a kind of photographic action; the epidermal to a chemical process of combustion or oxidation.

**Distribution of Land Molluscs in the Sandwich Islands.**—Mr. John T. Gulick contributes to *Nature* for July 18 some new and curious particulars respecting the distribution of a group of *Helicidae* known as the *Achatinellinae* in the different islands of the Sandwich archipelago. The group is characterized by a spiral twist of the columella, generally so strongly developed that the columella seems to be armed with a lamellated tooth revolving within the shell, and is peculiar to the Sandwich Islands. It consists of several genera, most of which are confined to a single island. A remarkable development is found on Oahu, an island sixty miles long, with an average breadth of about fifteen miles, on which are found no fewer than about 185 *Achatinellinae*, all, with only one or two exceptions, peculiar to the island. Nearly all the species are confined to the forest regions skirting two ranges of mountains, about forty miles long by five or six wide; and even here no one of the species is distributed over even one-half of this small mountain range, being mostly restricted to areas of from one to five miles in length. Each mountain valley has its own varieties, and in many cases its own species; and the same remarkably restricted distribution of species is found in the other islands of the group. Nearly all the species of one genus found on one mountain range are connected by varieties presenting very minute gradations of form and colour. Species of the same genus on different islands are not so completely connected by intermediate forms. The degree of difference between the several species of the same group is in proportion to their separation in space. Nearly allied species, occupying neighbouring localities, pass from one to the other by all the intermediate gradations of form and colour, while those whose homes are separated by a distance of eight or ten miles cannot be connected by minute gradations without bringing in some of the forms occupying the intermediate territory. Mr. Gulick is however unable to account for these differences by natural selection, survival of the fittest, or any other theory. The conditions under which the allied species live are so completely similar that it does not appear what ground there can be for difference in the characters best fitting the possessors for survival in the different valleys in which they are found. The ground species are mostly dextral, while the arboreal species are chiefly sinistral, though this rule is not without exception.

### Physics.

**Earthlight on the Moon.**—Prof. Shaler, of Harvard, who has devoted considerable attention to the appearance of the new moon when illuminated by the light of the sun-lit earth, has communicated his observations to the *Philos. Magazine* for August. With the 15-inch Mertz of the university observatory it is possible to see all the principal features of the topography of the dark region illuminated only with this earthshine. The eye is unable to recognise the craters by light and shade, the light being too feeble, besides being too vertical; the relief is due to the difference in the light-reflecting power of the various features of the topography. Whatever becomes very brilliant under the vertical illumination of the full moon shines out with a singular distinctness when lit by our earth's light. When the moon is not over twenty-four hours old, she is at her best for observation. The author was able to recognise nearly all the craters of the darkened part that are over fifteen miles in diameter, and probably one-half the bands which show with a power of 100 when the moon is full.

**The Atmospheres of the Fixed Stars.**—The first annual report of the observatory of Bothkamp, edited by H. C. Vogel, the director,

contains very important results, which extend our knowledge of the branch of astronomical science that Miller and Huggins may be said to have founded. The following red stars were examined:  $\alpha$  Orionis,  $\alpha$  Herculis,  $\beta$  Persei, and R Leonis Minoris, and gave spectra that agree perfectly in exhibiting a series of broad dull absorption bands having sharply defined boundaries on the side next the violet. In the spectrum of  $\alpha$  Orionis (*Betelgeuse*) many lines were measured and compared with those in Angström's atlas of the solar spectrum, and the presence of sodium, calcium, magnesium, iron, and bismuth, determined with a high degree of probability. The presence of hydrogen is uncertain, for in that portion of the stellar spectrum which should be occupied by H $\beta$ , the second hydrogen line, a dim band only is observed, and H $\alpha$  and H $\gamma$  are altogether absent. The lines of  $\alpha$  Herculis conclusively indicate the presence of sodium, magnesium, and iron, and probably that of calcium and tin. The spectrum of another red star,  $\alpha$  Bootis (*Arcturus*), differs greatly from those of the four above mentioned. It contains, in the place of bands, several sharp lines that could be measured with great exactness, and resembles most nearly the solar spectrum, but is distinguished from it by certain lines between D and  $\delta$ , not present in the sun, and by a dearth of lines in the red and blue. H $\alpha$  and H $\beta$  were detected with difficulty, and H $\gamma$  not at all, only a dull dark band being seen near G. A comparison with the lines of typical spectra was more easily made than in the case of  $\alpha$  Orionis, and the presence of hydrogen, sodium, calcium, magnesium, iron, and chromium determined with certainty, and that of barium, manganese, and silver rendered highly probable. Though in the brilliant spectrum of Sirius the hydrogen lines are astonishingly prominent, the groups of lines are otherwise so weak that it is only possible to recognise with certainty the two sodium lines D and the magnesium line  $\delta$ . The spectrum of the variable star  $\beta$  Lyrae is peculiar in having a continuous ground on which bright instead of dark lines are seen. Of three more striking than the rest, one near the D line is the most intense, a second is on the boundary of the blue, and the third a little short of G. The positions of the three were determined with great accuracy, and their values in wave-lengths are: 5875, 4859, and 434, the limit of error being within 0.2 millionths of 1 mm. The first line is rather more refrangible than D, and agrees with the one, usually termed D $_3$ , first noticed in the protuberances; the two others are hydrogen lines. Besides these, other bright lines were seen, one lying between D and C, the other probably being  $\delta$  of the solar spectrum, and corresponding with magnesium. (*Der Naturforscher*, No. 27.)

**The Meteoric Shower of 30th April—1st May.**—This meteor stream, the apparent position of whose radiant point is found by Schiaparelli to be in the Northern Crown, R.A. 237°, N.P.D. 55°, and which has also been recognised by R. P. Greg, was, according to D. Kirkwood (*Amer. Jour. Science*, July, 52), a more conspicuous object in earlier times. Meteoric displays are recorded by Quetelet to have occurred on this day, A.D. 927 and A.D. 934, and it is considered by the author that this stream of meteors may be connected in its origin with the comet which passed its perihelion about the 29th April, B.C. 136.

**The Altitudes of Aurorae.**—A paper on this subject in *Pogg. Ann.* No. 5, contains the results of observations of the aurora of the 4th February, made by Galle and Reimann, at the observatory at Breslau. Fourteen determinations made independently by these observers indicate a mean height of fifty-five geographical miles for the auroral rays. It appears probable that light is developed at even a less altitude than this, at forty miles, or what is practically the limit of the atmosphere, where, according to the observations of Liais, in Brazil, the last traces of reflected sunlight are to be detected, and the ignition of meteors is assumed to occur. The magnitude of the rays was not determined, but they are believed by these observers to have an average length of forty miles.

**The Electrical Condition of Gas Flames.**—Prof. Trowbridge, of Harvard, publishes a paper on this subject in the *Amer. Jour. Science* for July, page 5. He finds—1. That the flame of a Bunsen burner is negative while positive electricity accumulates on the burner itself, if it be a good conductor; when made of non-conducting material, no charge is noticed at the top of the flame. 2. The stratum of air in contact with the outer cone of flame is slightly charged with positive electricity, the partly consumed gas of the inner cone being neutral. 3. The presence of flames tends to change the nature of the atmospheric electricity at any given place, reducing a positive tension to a feebly negative one. As the electricity of air during cloudy and rainy weather is generally negative, or at the most feebly positive, the author considers that his observations in some degree warrant the popular idea that great fires are followed by a change in the atmosphere inducing rain.

The *Bulletin de l'Acad. royale des Sciences de Belgique*, No. 3, has a paper by J. C. Houzeau on a ready method of calculating lunar phases. It is especially intended for the use of students of history, and, with the help of the four tables appended to it, enables them to perform calculations of this kind with ease.

*The Nominal Suffix ya in Indo-Germanic.* [Ist in der indogermanischen Grundsprache ein nominales Suffix ia oder statt dessen ya anzusetzen? Von Theodor Benfey.]

*The Origin and Forms of the Indo-Germanic Optative.* [Ueber die Entstehung und die Formen des indogermanischen Optativ (Potential), so wie über das Futurum auf sanskritisch syāmi u. s. w. Von Theodor Benfey.] (Publications of Göttingen Scientific Society.) Göttingen : Dietrich.

PROFESSOR BENFEY has reprinted these two papers from the *Transactions of the Göttingen Gesellschaft der Wissenschaften*. Their titles are not ambitious : but the importance, at least of the second paper, for comparative grammarians is very considerable. In both of them is clearly seen the writer's acute and many-sided intellect : whether we agree with them or not, we learn from them.

The first (which in one way is introductory to the second) aims at proving that a nominal suffix which has played an important part in Indo-European languages had for its original form *ia*, not *ya*, as all philologists had hitherto believed : in other words, that it was a dissyllable, not a monosyllable—a circumstance which of itself raises a presumption against the new view, when we remember the undoubted antiquity of the suffix. The new evidence is the occurrence in the Vedas (clearly shown by Professor Benfey) of both the monosyllabic and dissyllabic form of the suffix, whereas in classical Sanskrit, as is well known, the former alone occurs. Which form is more frequent in Vedic writings is not certain ; nor, indeed, is it material : the dissyllabic form is found there abundantly ; and occurs also in Pāli and the Prakrits. Which form was the older ? The professor argues from the general improbability of so extensive a diaeresis of *ya* into *ia*, in default of parallel cases, and from the special improbability of so exceptional a change in Sanskrit, where the general tendency is to avoid hiatus : from the regular process of the formation of words, to wit, the meeting of open vowels in the amalgamation of the component parts ; which vowels are at first pronounced distinctly, afterwards phonetic change occurs in order to avoid hiatus : from some indications given by the Sanskrit

accentuation ; and, lastly, from the fact that the suffix undoubtedly appears as *io* in Greek and *io* in Latin. From these arguments, but more especially from this agreement of the three languages, whose records are much the oldest which we possess, he concludes that the original form of the suffix was *ia*, which afterwards, in the Asiatic and North European languages, passed into *ya*.

Professor Benfey's argument undoubtedly disturbs the quiet possession of the received theory. Yet there is something to be said for that too. The agreement of the three languages—Sanskrit, Greek, and Latin—would be much more striking if the two last had possessed the *y*-sound : the few cases where it seems to occur in Latin, e.g. *Pompeius*, are scarcely to be regarded. Greek and Latin could not change from *i* to *y* : the other languages, which had both sounds, could change as easily from the one as from the other. The solution, therefore, of the question in favour of *ya* rests not merely (as Professor Benfey says) on a numerical preponderance in its favour, which would certainly not be conclusive : the nature of the evidence on the two sides is different : the evidence which can be drawn from Greek and Latin is much less conclusive. Further, it seems to me hard to separate the history of the nominal suffix *ya* from the verbal suffixes—formative and inflectional—of the same form : nor, I think, does Professor Benfey altogether wish to do so. But the manifold forms which the formative *ya* takes in Greek become in this way very unintelligible. Once derive them from a sound which the Greeks could not pronounce, and therefore endeavoured in many different ways to avoid, and all is plain. But why should there be such variety from original *ia*, a combination to which the Greeks had no objection ? Lastly, the occurrence of *ia* beside *ya* in Vedic undoubtedly is easiest to understand on the professor's hypothesis—that *ia* was original, but began to pass into *ya* in the age of the Vedic hymns (both forms then existing), and was altogether lost in the classic period. But the very theory by which he explains the curious occurrence of *both* forms in the same literature may help us to understand how *ya* could pass for a time and to some extent into *ia*, and yet be fully re-established again. The Vedic language, Professor Benfey says, is an artificial language—derived, indeed, but yet quite distinct, from the popular speech. I quite agree : and is it not just in such a language as this that an artificial diaeresis might be expected ?—a diaeresis which never established itself in the popular speech, which retained the original sound *ya*. I do not think that we should expect Vedic peculiarities of the sort to pass into the popular Sanskrit. Professor Max Müller's remarks on the license of pronunciation allowed in the Vedic hymns (*Rig-Veda-Sanhita*, vol. i. preface, p. lxxvi) seem to me pertinent here.

The second paper before us is an enquiry into the origin of the optative. In this enquiry is involved a larger question—as the professor points out—whether the principle originally laid down by Bopp, that such formations were compounded out of pre-existing words, not roots, or at all events out of a root and a word, is to be still maintained, as against the newer theory, that the changes of meaning in the moods were expressed by the insertion of probably pronominal roots. Bopp held that the optative-suffix was *ya*, formed from a root *i*, “to wish,” with the suffix *a* : from this primary sense of wishing he thought that the other powers of the optative could be deduced. Professor Benfey adopts this view, with modifications designed to meet one or two difficulties in it. The first difficulty is the assumption by Bopp of the special Sanskrit phonetic law (by which *i* + *a* became *ya*) in order to get the ground-form applicable to all Indo-European languages. To this difficulty, which is

considerable though not fatal, because *i* might have passed into *y* in Indo-European (which possessed both sounds) and then been reinstated in Greek and Latin, Professor Benfey adds an objection to the insertion of *ya* before the personal endings. I do not understand Bopp as necessarily maintaining such an insertion: it is contrary to his principle above stated: but undoubtedly Benfey's objection to the insertion of such verbal roots is supported by all analogy. His own view is that the optative forms (which are three in Sanskrit and more in Greek) do not spring from one common origin—but from different tenses of a verb *i*, "to wish," which he agrees with Bopp in looking on as the radical idea of the mood. These tenses are the present and imperfect—indicative and conjunctive—both of the simple verb *i* and of the same verb as a base with a suffix *a*. From the imperfect of the simple verb *i-am* (*i-m*), *i-s*, *i-t*, &c. we get the Sanskrit forms of the first conjugation (*bhāreyam*, *bhāres*, &c.), the Greek ordinary forms (except the first person *phēroumi* in common use, but the archaic first person) *phēro-u*, *phēro-is*, &c., and the Latin futures *feres* (for *fera-is*), &c. The other usual forms he gets from the imperfect conjunctive of the base *ia*, i. e. *iām*, *iās*, &c.—which give the Sanskrit forms of the second conjugation *-yām*, *-yās*, &c., the Greek *-ην*, *-ης*, &c., the old Latin *-iēm*, *-iēs*, &c. (e. g. in *siem*), and the Gothic *jau*, *eis*, &c. The middle voice of the Sanskrit is the imperfect indicative middle of the simple verb, *i-ma*, *i-sa*, &c.—but, it must be confessed, with some strange changes of termination. Other Greek forms are ingeniously fitted into their respective holes: *phēro-umi* is the indicative present of the simple verb—meaning simply, "I wish to bear": forms like *τύψαια*, *τύψαιας*, &c. are given to the imperfect of the base, *iam*, *ias*, &c.: the Homeric conjunctives *θείης*, *μεθε-ίης*, &c. are present conjunctives of the base; *δαμείω* is the base present either conjunctive or indicative; *θε-ίο-μεν* is the indicative either present or imperfect: lastly, the indicative present, *i-ā-mi*, *i-a-si*, &c., when attached to the root *as* (*es*) "to be," gives the future; in Sanskrit *-syāmi*, in Greek *-σω* through *σω*, and in Latin *ero* for *es-ia*.

All this is extremely ingenious, and holds together well. There is nothing improbable in this application of many forms to denote one category: on the contrary, it is in accordance with all we know of the principles of language. I wish to point out some difficulties in the theory; but I fully recognise that Professor Benfey has made out a very fair case with the evidence he has to deal with: he candidly lays claim to no more.

In the first place, it seems quite impossible to prove that the vowel *i* was ever long in the optative of either Greek or Latin. In *siem* it was short, and the Greek admits of no proof either way. Professor Benfey seems to recognise the difficulty at p. 9, where he speaks of *oi* becoming *α* in Greek, and gives *κοίτη* from *ki* as an instance. But there is no proof that the root *ki* was long in Greek: I believe it to have been short in Graeco-Italian, as shown by Latin *quies*, &c. But it is essential to any establishment of the professor's theory that it should be proved to be long, or at least to show some traces of its having been so: for otherwise the sense "to wish" falls to the ground. Indeed there is but unsatisfactory proof for this root. Professor Benfey regards it as = *i* + *i*, the intensive of *i*, "to go," in the sense of applying to a person, requesting, wishing: then from wishing, he devises a transition through possibility to potentiality, in order to account for all the meanings of the verb. Now it does not seem easy to establish the sense of wishing for *i* even in Vedic: in common Sanskrit the sense does not occur: and Professor Benfey himself has some excellent remarks (p. 21) on the fact that in a living language a word never really has too distinct senses at the same time: it has

one sense, though under special circumstances it may be applied to express another: and consequently it is improbable that *i* should really have had the special sense of wishing, here assumed to be so old, when it actually means "to request" in Vedic. In Greek and Latin we find no *i*; we have *i*, "to go": the Greek *ίότης* and *ίμερος* may point to a secondary root *is* with the desired sense: the nearest form is the Homeric *ίμενος*, which exactly corresponds to the Vedic *iyamāna*; but too much dependence must not be placed on the length of the vowel here: it is short in *ιενται* (*Od.* xxii. 304); and cases like *ἀθανάτος*, *ἀπονείσθαι*, &c., where a short vowel is artificially lengthened when followed by two or three others, are too common in Homer for us to feel certain about this one.

In the next place, does the syntax of the different languages, in which the mood occurs, countenance the view that "wish" (or "power") was the primary sense of the mood? In Latin the mood was absorbed into the subjunctive; but this very absorption points to a similarity of function and origin. In Sanskrit, it seems in the main conditional: but here we must wait for fuller information on the most important subject of Vedic syntax from Professor Benfey himself. When, however, in classical Sanskrit we find (e. g. *Nala*, i. 30) *vīṣiṣṭāyā vīṣiṣhtena saṅgamo guṇavān bhavet*, we seem to have a perfectly parallel usage to the Homeric (e. g. *Od.* iii. 231) *ρέια θεός γ' ἐθέλων καὶ τηλόθεν ἄνδρα σώσσαι*: that is to say, a direct statement differing from the indicative only by the introduction of more or less uncertainty; the statement of a conception, not of a fact. Now this usage is frequent in Homer; in Attic Greek it is hardly traceable: while the sense of wishing, and of potentiality (with *ἄν* or *κέν*), are comparatively rare in Homeric Greek, but fully established in Attic. This surely does not point to wishing as the primary sense of the mood. Again, it is well known that the subjunctive and optative are used in Homer to express the same kind of idea, only with different degrees of certainty. In the line, *ἄλλον κ' ἐχθαίρησι βροτῶν, ἄλλον κε φιλοίη* (*Od.* iv. 692), the optative is no whit more potential than the subjunctive. So far as sense goes, I can see no reason for treating the optative as a different kind of formation from the subjunctive. I do not know whether Professor Benfey would now form that mood on the same principle as his optative: but in his excellent *Kurze Sanskrit-Grammatik*, while confessing doubt on the matter, he seems to acquiesce in the usual explanation of the *a* of the subjunctive, namely, that it is an inserted element adding uncertainty to the verb. Now if this explanation is the best that can be given for the subjunctive suffix *a*, why should it not be tenable for the optative suffix *ya*? It seems to me that the received view is internally probable, by which both *a* and *ya* are regarded as demonstrative roots: I hold to the opinion that the relative sense of *ya* is later. In this explanation we have the analogy of the augment to help us: only the same element is attached to a different portion of the word, naturally to avoid confusion. I take the steps to be these: *φῆρε(τ)* = "he bears," *φῆρη(τ)* (with the inserted *a*) = "he bears there" = "he bears not here but elsewhere" = "his bearing is present to the mind only" = "he may be conceived of as bearing." The same explanation holds for the optative, probably a later formation and possibly to denote greater remoteness. Hence the subjunctive, as giving the nearer event, can be used to express greater probability: also as dealing with an object near at hand it gets its well-known usages to express doubt and questioning with reference to immediate action. The optative, on the other hand, as formed by the stronger suffix, can express a greater degree of uncertainty, a more remote consequence, and a wish, realised as a mere conception.

It is, no doubt, a strong point against this theory that it gives no explanation of the almost universal change of *ya* to *yā* in this suffix. The long *a* before *m* in the Sanskrit first person singular and plural may be explained by the nature of the following sound—compare the extraordinarily disproportionate number of lengthenings before *μ* in Homer—and the dual *-āva* may have followed on analogy. But no physiological reason, so far as I know, can be assigned for lengthening a vowel before *s* or *z*. This difficulty then must be admitted.

JOHN PEILE.

**China's Place in Philology.** An Attempt to show that the Languages of Europe and Asia have a Common Origin. By Joseph Edkins. Trübner, 1871.

THE first part of the problem alluded to in this title, China's place in philology, is certainly one of the most interesting and important of linguistic questions; and no one can be better qualified to answer it than Mr. Edkins, whose knowledge of Chinese and its dialects is at once extensive and accurate. But instead of restricting himself to this first part of the subject and investigating the phonetic and grammatical forms of Chinese in connection with other monosyllabic languages (Annamese, Siamese, Burmese, and Thibetan), the author descends from the scientific to the theological level by attempting to prove that the languages of Asia and Europe proceed from a common origin. Even if this could be done—and in the attempt the principal question is made to appear of secondary importance—we are at a loss to imagine what the author supposes himself to have gained thereby; for his object, as his theological attitude plainly shows, is to prove the unity of *all* races, and for this it would have been necessary to adduce the languages of Africa and the New World, which he entirely omits to do. Apart from this error, into which a philologist of the nineteenth century ought scarcely to have fallen, the method followed in his work is not exactly on a level with the present standard of scientific enquiry. Mr. Edkins fares no better than Xylander in his well-known book, *Das Sprachgeschlecht der Titanen*, when he allows himself to compare Chinese and Mongolian words with Greek and Sanskrit ones, and Thibetan with Hebrew, without considering the possibility of the origin suggested in each individual case. Thus before investigating the formal or phonetic elements with sufficient accuracy, he lays hold on certain morphological or syntactical coincidences, which, as is well known, can only be relied upon when the first two points have been already cleared up.

The author's observations in chap. iv. on the origin of language were evidently written in ignorance of the labours of Steinthal and L. Geiger, a pardonable circumstance considering his residence at Pekin; but some of the views which he imparts are such as even a theologian—in Darwin's native land—ought not to introduce into a work of scientific pretensions.

We fail to see how the enquiry into China's place in philology is furthered by the author's declaring the Chinese to be "Hamites who migrated eastwards before the building of the tower of Babel," for certainly no philologist would take such a statement upon faith, and to those who would, the whole question is a matter of indifference. The author is also in error in maintaining, in the beginning of the seventh chapter, that the Himalayan languages are more modern than Chinese; on the contrary, according to the latest researches, they as well as the other monosyllabic languages belong to a much older phase of phonetic development than Chinese.

In spite of these defects, to which must be added the numerous inaccuracies in transcription of Indo-Germanic and

Semitic words, the book contains many valuable remarks upon the languages of Upper India; and especially the greater part of what the author communicates from the rich stores of his sinological learning is at once new and of the highest interest for philologists.

FRIEDRICH MÜLLER.

#### A Grammar of the Urdu or Hindustani Language.

By John Dowson. Trübner.

THIS grammar belongs to the best sort of those intended for practical use and convenience. It gives all the grammatical materials and the rules of syntax with completeness and brevity, which should make it fully answer the purpose for which it is intended.

There is however one essential defect which it shares with all the Urdu grammars that have hitherto appeared, that of ignoring the importance of comparative philology. When it is found that languages of older formation such as Latin, Greek, or Gothic, cannot be thoroughly understood without applying the comparative method and assimilating the results of modern philology, the same must be even more certainly the case with a quite modern language such as Urdu, which is more nearly parallel to the Romance dialects. Just as it is impossible to obtain a really scientific insight into any of the Romance languages without reference to Latin, so it is impossible to comprehend any form in Urdu, which belongs to the linguistic treasury of India, without recurring to Pali, Prakrit, and Sanskrit. And that this is not a matter of indifference even to the practical student appears from the rule discussed on p. 113, "The Agent Case," which, as the author himself observes in the preface (xiii), can only be understood by the help of Sanskrit.

The scientific study of the languages of modern India is especially incumbent on English scholars; no one in Europe has so close a concern with these languages, which possess a rich popular literature, and it may even be hoped that Sanskrit literature will be enriched and supplemented by their study.

As much unexpected light was thrown by the Romance languages upon the history of Latin (cf. Schuchardt's excellent work), certainly a profounder study of the new Indian dialects would explain many obscurities in Sanskrit. The Sanskrit lexicon, in particular, which at present, like the Arabian, contains an amalgamation of the most discordant elements, might be thoroughly sifted, and dialectic differences certainly would come to light as the popular languages were investigated. But to attain this result, the matter must be viewed from different sides, and in the first place a zeal for the scientific study of the popular dialects must be awakened.

FRIEDRICH MÜLLER.

M. SHAPIRA.

#### TO THE EDITOR OF THE ACADEMY.

SIR,—In the *Athenæum* of to-day there is a letter, dated Jerusalem, July 24, 1872, and signed "H. J.," which gives an account of "the excavations in search of antiquities in Moab, which are being carried on under the auspices of M. Shapira," and which "have proved surprisingly successful." Allow me to repeat the warning which I gave in a recent number of the *Academy*. There was shown to me some weeks ago, at the British Museum, a drawing of the top of a pillar, sent home by M. Shapira. On it were figures of animals and an inscription, partly in Phœnician and partly in Nabathean characters. The authorities at the Museum seemed to have little doubt that the whole thing was a forgery.

That the Count de Vogüé should have secured a fine Phœnician inscription of fifteen lines, dug up at Beirut, is a matter of congratulation.

W. WRIGHT.

Cambridge, August 10, 1872.

## Intelligence.

The experiment which is being tried at Zürich, of admitting women to the ordinary academical course, is attracting considerable attention in France and Germany as well as in England, especially in view of the sudden increase (from seventeen to fifty-one) in the number of such students which has taken place this year. A very well informed writer in the *Allgemeine Zeitung* (July 23, 25, 26) represents the professors as entirely satisfied with the results at first obtained; but it appears that some of the latest comers (chiefly Russians) are imperfectly prepared for the university course, and to guard against any danger of lowering the academical standard, it is proposed to introduce a matriculation examination for all the students alike, and this plan is favoured by the ladies themselves, who are of course anxious that the degree of the only university open to them should not lose its relative or its positive value. Forty-four out of the fifty-one students are inscribed in the faculty of medicine; and a pamphlet by the physiologist Bischoff, who entertains a strong *à priori* objection to the study of medicine by women, has called forth an answer by his colleague, Prof. Biermer, who has had in all twenty women in his lectures, and speaks highly of the accuracy and penetration of the best amongst them. He adds: "Gerade in der Mikroskopie, einer wichtigen Seite der modernen Medicin, hat meiner Ueberzeugung nach das Weib eine Zukunft." As to the anticipated inconveniences of lecturing on anatomy, &c. before mixed classes, the professors are unanimous that none have arisen. The conduct of the young men has been irreproachable, and the serious zeal of the ladies has acted as a stimulus to the other students; the only difference made by their presence in the lectures is that the slightest facetiousness of tone has become impossible, and this sacrifice, if it can be so called, the professors make without reluctance. The experience of Zürich is important because Lord Gifford's interlocutor in the action brought by the lady students at Edinburgh against the senate and chancellor of that university may be considered to decide the case practically in favour of the former. The French universities, it is noticeable, show much less reluctance than those of Germany to the admission of female students.

M. Ganneau, whose name is so well known in connection with "the Moabite stone," has published in the *Revue archéologique* a list of Hebrew, Greek, and Latin inscriptions discovered by him in Palestine. Twelve of them are described as Hebrew inscriptions, including—No. 1, the Moabite stone; Nos. 2 and 3, inscriptions in Phœnician characters found at Silvân, and presented to the British Museum; Nos. 11 and 12, Greek inscriptions, with a single word in archaic Hebrew. There is also one in each of the following characters: hieroglyphic (found at Gaza), cuneiform (found at Salt), ancient Aramaic, Phœnician, Nabathean, Estrangelo, Pehlevi; also eight Latin and fifty-six Greek inscriptions. A large number of engraved stones, graffiti, texts of the Crusades, cufic and other inscriptions (not all found in Palestine) are not included in this catalogue. M. Ganneau is now in Paris.

With the publication of the twenty-first volume of *Kuhn's Zeitschrift*, a new series commences, under the same direction as the old. An index to the last ten volumes is in the press, and will appear in the course of the year.

Messrs. Teubner announce *Untersuchungen über das System Plato's*, by Dr. David Peipers; an *Anthologia Latina Epigraphica*, by Bücheler; an edition of Demosthenes' *de Corona*, by J. H. Lipsius; *Polemonis Declamationes*, by Hinck; and *Porphyrius Commentarii in Horatium*, by W. Meyer.

In *Fraser's Magazine* for August, "Pronunciation of Latin," by D. F., supports the hard pronunciation of *c* and *g* by Celtic analogies, which are also used to explain the transition to the present Italian pronunciation, which is recommended for practical adoption.

## Contents of the Journals.

*Journal Asiatique*, No. 70.—Essay on the two principal Aramean dialects, by M. l'Abbé Martin. [The introduction explains the local distinction between the two dialects, which corresponds pretty nearly to the religious division between Nestorians on the one hand, and Jacobites, Maronites, and Melchites on the other. M. Martin then proceeds, on the basis of Bar-Bahlul, Jacob of Edessa, Bar-Hebraeus, &c., to examine, 1. phonetic questions, and 2. different parts of grammar; concluding with some remarks on Syriac lexicography. He expresses an unfavourable opinion as to the results to be obtained for the lexicon from publishing the works of Bar-'Aly and Bar-Bahlul. Passages from manuscript authorities are given at the end of the number.]—Intelligence, and notice of the Appendix to Perny's *Chinese Dictionary*.

The Pandit, Vol. vii. No. 73 (June).—The *Śabdachintāmaṇi* (or fourth book of the *Tattva-chintāmaṇi*, a celebrated work on *Nyāya* philosophy), with Ruchidatta Miśra's comment. [Continued.]—The *Brahma-mīmāṃsā*, or *Pedānta* aphorisms, with Kanthasivachārya's

comment. [Continued from the 19th aphorism of the 1st pāda of adhyāya I. to the end of the 2nd pāda.]—A *śāstram* (*upasaṃhāra*), by Vāmanāchārya, of the drama *Viddhaśālabhanjikā* of Rājasekhara.—The first portion of the *Karpūramanjari*, a *Śaṭṭaka*, or dramatic composition in Prākṛit dialect, by Rājasekhara. Edited, with a Sanskrit translation, by Vāmanāchārya.—The *Vidvan-mano-ranjini*, or "Rejoicer of the Mind of the Learned," a commentary on Sadānanda's *Vedāntasāra*, by Rāmāthirtha. Edited, with an English translation, by A. E. G. and G. D. [Continued.]—Catalogue of Benares Sanskrit MSS. [Continued. MSS. 5–10 of *Nyāya* and *Vaiśeṣika* works.]

Rheinisches Museum, vol. xxvii. pt. 3.—A. Holm: The Discoveries in the Great Temple at Selinus in the Spring of 1871. [With facsimile of an Inscription.]—K. Diltthey: On the Greek Hymns published by E. Miller. [Discusses them in connection with the magic-papyri edited by Parthey, with remarks on the earlier literature of magic, and some emendations on the text.]—L. Ziegler: On the Text of the Scholiasta Bobiensis on Cicero's Orations. [A number of critical notes, the result of an accurate re-examination of the palimpsest.]—J. Gildemeister and F. Bücheler: Themistios *περὶ ἀρετῆς*. [A German translation of the Syriac version by which alone this valuable relic of antiquity has survived.]—H. Gelzer: Inscriptions in Asia Minor.—W. Schmitz: On the Tironian Notes.—Fr. Rühl: Corporare.—L. Müller: *In re Simonides*. [Prof. L. M., writing from St. Petersburg, informs us that the Russian officials know nothing of Simonides or his whereabouts.]—L. Müller: On Tacitus and Suetonius. [On a supposed surviving fragment of the Fulda MS.]—F. Bücheler: Coniectanea.—W. Clemm: Oraculum Pythium. [Proposes to emend the line *ἡ φιλοχρηματία πᾶν δαεί, ἄλλο δὲ οὐδέν*, by reading *ἄλλ' δαεί οὐδέν*.]—N. Wecklein: On Euripides. [*Phoen.* 722 and 916.]—M. Schmidt: A Decade of Conjectures. [On Plato, Thucydides, &c.]—J. M. Stahl: On Thucyd. iv. 28.—W. Teuffel: On Plautus, *Trinumm.* 725.—L. Müller: On the poem *De Sodomā*. [An attack on Haupt.]—A. Riese: On Cato. [*Gell.* xi. 2.]—E. Bachrens: On Varro's *Saturae Menippeae*.—G. Krüger: On Cicero. [*Pro Sextio*, 6, 14 and 11, 26.]—A. Eussner: Coniecturae in Sallustii Catinam.—M. Schmidt: On Hyginus.—Erotemata philologica, &c.

*Zeitschrift für Deutsches Alterthum*, iv. 1 (Berlin).—Steinmeyer: Glossen zu Prudentius (Old High German).—Wilmanns: Metrische Untersuchungen über die Sprache Otfried's. [Attempts to settle the quantities of the end-syllables by means of the rhymes and assonances.]—K. M.: Um Ragnaröckr. [The word is a late corruption of *ragna rök*, in which *rök* is equivalent to the Old E. *racu*, and signifies "fate," by an easy process of metaphor. The usual translation "Götterdämmerung" has, therefore, no foundation in the older mythology.]—K. M.: Uuāra und Uuara. [Shows by a comparison with the Old High German forms that the separation of *wēr* (foedus) and *wōru*, gen. *wōre* (Schutz), in Beowulf is wrong: both words should be written with the long vowel, corresponding to the O. H. G. *wōra*, which from the original sense of "truth" develops that of "fidelity" and finally "protection."—iv. 2 (Halle).—K. Maurer: Zur Geschichte der Godenwürde. [Traces the origin and development of the Norwegian and Icelandic priesthood in heathen times.]—F. Koch: Englische Etymologien [*a-jar* from O. E. *cerr* (turn), *aukwārd* from a conjectural O. E. *asoc* = Gothic *ituks*, *big* from *būan* in the sense of "adorn," *bad* from *bedling* (effeminatus), *cushat* from a hypothetical *cwic-sceote*, and some others of less importance].—Zu Lamprecht's *Alexander II.*, von J. Harczyk. [Comparison of the German poem with the earlier traditions.]—L. Meyer: Zur *Germania* des Tacitus, Schluss. [Criticisms on the explanations given of various passages.]—S. Bugge: Zum Beowulf. [Valuable emendations and explanations of the text: a continuation of earlier articles in the *Tidskrift for Philologi og Pædagogik*.]

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 55.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The Editor cannot reply to questions from authors respecting the notice of their books.*

*The next number will be published on Monday, September 16, and Advertisements should be sent in by September 11.*

## General Literature.

## THE FOLKLORE OF GREENLAND.

**Esquimaux Tales and Legends**, translated from the Communications of Native Informants. By H. Rink, Governor of South Greenland. With Supplement, containing an Appendix on the Esquimaux. [*Eskimoiske Eventyr og Sagn, oversatte efter de indfødte Fortælleres Opskrifter og Meddelelser.* Af H. Rink, Inspektør i Sydgrønland.] Kjöbenhavn : C. A. Reitzels Boghandel, 1866. [*Supplement, indeholdende et Tillæg om Eskimoerne.* Af H. Rink.] Kjöbenhavn : 1871.

THE development and significance which the study of ethnography and the history of civilisation has acquired of late years, and the small degree of trustworthiness of the information upon which we are often forced to rely, combine to magnify the importance of these communications respecting a people dwelling at the furthest extremity of the earth; the rather that they come from a person peculiarly well qualified to guarantee their authenticity. He occupies a post in that remote Danish possession which assures him an ample supply of the required information, and he is further assisted in making use of it by the fact that he has constantly endeavoured to come directly in contact with the native inhabitants, in dealing with whom his familiarity with their language is also very serviceable. To these qualifications must be added a most praiseworthy sympathy for the poor inhabitants of these polar regions, who not only have to contend against their icy, niggardly climate, but are obliged to submit to the oppression and contribute to the support of the missionaries and other European residents as well. The results of his experience and his investigations upon Greenland and its inhabitants are set down in the two volumes named above. Though they deal chiefly with the folklore of the Esquimaux, they also contain a good deal of circumstantial information on other points relating to the people, in furnishing which of course the folklore itself is amongst the most important of our sources concerning the religion, the history, the usages, and the intellectual and material condition of past and present times. Since the appearance of the first volume, the value of this work of Rink's has accordingly been so generally recognised that the supplementary volume is published at the expense of the Scientific Association at Copenhagen and the minister for ecclesiastical affairs and public instruction.

I shall return presently to the legends, but will begin by noticing some of the religious opinions of the Esquimaux, together with the usages to which they have given rise, especially those which have analogies in other countries. Thus according to the view of the Greenlanders, when still heathens, divine justice displayed itself mostly in this life,

VOL. III.—NO. 55.

yet they had also, it is said, the conception of rewards and punishments after death, and believed that witches and bad men came into the upper world, where they suffered from cold and want, and played with a walrus head, which was the cause of the northern lights; they were therefore called *Arssartut*, or "those who play with missiles." The lower world, on the contrary, where warmth and plenty reigned, was for the *Arsissut*, or "dwellers in abundance;" that is, all who had done great deeds in their earthly life, or had undergone much suffering, especially those who had perished at sea, and, lastly, women who had died in childbed, a conception which is met with also in the Marquesas islands and in the Lechrain, a district in Bavaria. The Greenlanders believed that a child murdered at its birth became an evil spirit, *angiak*, a belief also met with amongst the Norwegians and the Norwegian Lapps. The *Oromatua*s, the most powerful of all the spirits recognised by the inhabitants of Tahiti, had the same origin, and amongst the Polynesians in general the ghosts of children passed as being peculiarly malevolent. It is also noticeable that the Greenlanders trace the origin of death to a quarrel between two of the first men, one of whom said: "Let day and night alternate, and let mankind be mortal;" and the other: "Let it be always evening, and may men live for ever." This tale or myth bears a striking resemblance to a South African one of which Bleek gives five different versions (*Reynard the Fox in South Africa*, Nos. 31-35, "The Origin of Death"). Singing in the ears, which is variously interpreted in different countries, is said by the Greenlanders to be the voice of the dead asking for food, while to the Scotch it announces the death of a friend (for which reason they also call it "the dead bell"—Hogg, *Mountain Bard*, 3rd ed. p. 31). The conception of the *Igdlok* or *Igdinak*, a being in the form of a half-man, with half a head, one eye, one hand, and one leg, is met with elsewhere, as amongst the modern Greeks and the Musselmans; there is no reason for supposing that the latter derived it from the Zulus (Tylor, *Primitive Culture*, i. 353); on the contrary, it is more probable that it has everywhere arisen independently. It is forbidden to point with the fingers at the *Inua* or genius of certain spots, such as mountains, headlands, and ice-fjords, because this is supposed to make him angry. The same prohibition in Germany extends to the sun, moon, and stars; and though the modern Christian explanation is that you may run a little angel through in the act, the original heathen motive for the superstition is very likely to have been the same as in Greenland, though of course it may have been formed independently in the two cases. The *Angakoks* (conjurers) and *Iiseetoks* (witches) breathe forth fire, as in the German saga of Dietrich of Berne, and in the Anglo-Saxon *Havelok the Dane*. Amongst the accomplishments of the *Angakoks* was that of opening the bodies of the sick, taking out the entrails, washing them, and putting them back in their proper place. This too is an old idea, especially common in the East, from whence it was probably derived. Cf. my notice in the *Gött. gel. Ans.* 1868, p. 1656; to which may be added the following passage from an unpublished dialogue dedicated to the younger Lorenzo de' Medici:—

"Is (sc. medicus) ut fertur, daemones ciodaemones magica arte invocatur atque coeretur, lubetque ut languentis illius quem vult simulacrum vel formam daemones illi sibi deferant et eam scindant atque eviscerent. Ibi vero cum magno lumine consecratae candelae passim viscera omnia suis manibus revolvit atque oculis suis diligenter perillustrat, ut aegrotantis illius singulos intueatur languores. Tandem vero de invaetudine ac invaetudinis causa bene conscius factus, illud simulacrum reintegrari atque consui et in suum locum reduci praecipit, post vero languenti, cuius erat simulacrum medelas adhibet opportunas, si autem de salute illius desperet, id suis affinis patefacit, ne in vanum pro salute sua

laborent. Sed aegrotantis prius ac genetricis ejus nomen solertissime perquiri, de genitoris autem nomine nihil sibi curae est, nam de vero patre incertum nomen esse dicit, matris autem certum : ne sui daemones aliam aegrotantis loco formam sibi deferrent.”—*Il Paradiso degli Alberti* ... a cura di Alessandro Wesselofsky, vol. i. pt. i. p. 264, Bologna, 1867.

Evidently here the same process is applied to the image which the physician was supposed by the common people to perform on the sick person himself. Hydromancy was also known to the Greenlanders; the Angakoks used to divine from water the fate of persons and things that had disappeared. The conjurations of the Angakoks used to take place in a perfectly dark house, after they had had their hands tied behind their back and their head made fast between their legs. When the incantations were over, it was allowable to strike a light, and then the Angakok was seen free from his bonds, exactly in the approved style of a modern medium. The belief that the ghosts of departed mortals can be killed over again is not peculiar to the Esquimaux; it is shared by the ancient Hindoos, the Tartars, and many European nations, such as the Greeks, ancient and modern, the Kelts, the French, Scandinavians, Germans, &c. Further may be noticed the reluctance of the Esquimaux to pronounce the names of the dead, or of persons present, and especially their own name, a prejudice met with amongst other uncivilised races, as well as in the elder *Edda*, and in Scandinavian and apparently in early English popular verse (Tylor, *Early History of Mankind*, 2nd ed. p. 142 : cf. 127; Svend Grundtvig, *Danmarks Gamle Folkeviser*, ii. 339, 340). Any one who bears the same name as a deceased person changes it in order to deceive and escape from death, in the same way as amongst the native tribes of America and the Sunda islands. As another superstitious opinion may be mentioned the belief that evil-smelling things, especially old urine, have a peculiar power of banishing supernatural beings (comp. the Icelandic *alfreki*), and this is probably the explanation of the custom followed in Greenland of holding a vessel containing the same over women in labour, because women in that condition are supposed to be especially exposed to the attacks of evil spirits; a belief of which traces may still be found amongst civilised nations. The *couvade* in the narrower sense, when the husband, after his wife has been delivered, takes her place in bed, and remains there, while the mother gets up and goes about her business, “is only an addition, to deceive the sickness-spirit of puerperal fever, and to protect the new-born infant from the pursuits of demons desirous of substituting a changeling” (Bastian, in Lazarus and Steinthal’s *Zeitschrift*, v. 153, sqq.). In Greenland a child soon after its birth is licked by the mother all over lengthwise from the head to the toes, in order that it may enjoy health and long life; in Labrador the operation is adjourned till the end of the first year. The Esquimaux believe that spirits are unable to pass through running water, a superstition that prevails amongst the Lusatian Wends, who still make a point of placing water between themselves and the dead as they return from a funeral, even breaking ice for the purpose if necessary. And Sir Walter Scott (in a note to the *Lay of the Last Minstrel*) observes: “It is a firm article of popular faith that no enchantment can subsist in a living stream. Nay, if you can interpose a brook between you and witches, spectres, or even fiends, you are in perfect safety. Burns’ inimitable *Tam o’ Shanter* turns entirely upon such a circumstance.”

Leaving the superstitions of the Esquimaux, we turn now to their legends, with respect to which Rink remarks that the more recent amongst them show little disposition to spread along the coasts, but that on the contrary every district contents itself with recording the occurrences of the immediate neighbourhood and the last generation. The distance from Labrador makes it therefore exceedingly im-

probable that there should have been a constant exchange of legends kept up after the Esquimaux had reached their present places of settlement, and one is driven to suppose that the older legends which are common to both countries must date from a time when the present inhabitants of both stood in a much nearer relation to each other, that is to say, before they separated to spread east and westward along the shores of Baffin’s Bay. The substance of the legends is partly religious, partly historical, partly poetical; but, as a rule, all three elements are mixed together, though there are also some that belong exclusively or principally to one or other class. In his section on religion, Rink has fully discussed the religious element, which is, without doubt, the most important and the most universal. The more recent legends are those which may be regarded as chiefly historical. They give us a picture of the breaking up of the nation into a number of small communities which, as above observed, only preserve the memory of quite recent events in a single spot. Such narratives generally reach back only 100 years, more rarely 150, but the narrators can upon the whole give an exact account of genealogies within this limit, that is to say, for five or six generations. However, though the persons, and the principal incidents in their life, are really historical, and correspond with the information derived from other quarters, they are nevertheless embellished with ingredients taken from older legends, and the spirit-world is made to play a considerable part in the story. As for the old Scandinavian settlers in Greenland, the ruins of their habitations are known to exist in two principal localities in South Greenland, that is, in the neighbourhood of Julianshaab and Godthaab. There can be no doubt that in the years immediately following their destruction, many tales were told concerning them by the native inhabitants, yet only two still survive; one, the most important, giving an account of a war between the Esquimaux and the Northmen, is localised in both those districts. That there should be a poetical element in the legends is a matter of course, as otherwise they would not have arrested the attention and seized the fancy of the listeners, or, in other words, they would have failed to inspire that love which has preserved the older legends unchanged for upwards of a thousand years. The legends are also important because they offer a speaking picture of the Esquimaux’s way of looking at life, so that we can see at once in what respects it differs from ours. As Rink remarks, we ought not to be surprised at the absence of any pictures of what we consider beautiful in nature, for it is only in few spots that the Esquimaux catch in their summer excursions a glimpse of green valleys, with a little scanty shrubbery. Their taste does not lead them to seek out such places where they exist: far otherwise; the sea and winter with all their dangers, which the fancy pleases itself by even heightening, on the one hand, and on the other an ample provision of lard and meat, by the help of which the Greenlanders bid defiance to those dangers, far outweigh to his thinking all those advantages which the sun draws from the lap of earth under a brighter sky. The legends reflect the life of man as truly as they do the moods of nature, and one does not have to read far in them to see that property counts for literally nothing, while courage and strength are everything; that some expend their strength chiefly in dashing hither and thither in their *kajak* (the Esquimaux fishing-boat), and stretching so far out to sea that at last the tops of the highest mountains look like the head of a seal bobbing up and down upon the surface of the water; that others again are admired and emulated for the fortitude with which they endure the severity of winter, and go out fishing, after all their comrades have given up the idea in despair, and so save them from perishing with

hunger ; and that there are yet again others who set at nought the infirmities of old age, and as grandfathers continue to procure the necessary means of support for their families. We see from all this how greatly the Esquimaux is absorbed in the "struggle for existence," which leaves him little leisure to admire the beauties of nature, and yet they do not escape him altogether, as we see from the following song for summer :—

"Oh summer warmth, who hast come again now—Not a breath of air stirs, ama hai,—And there is not a cloud in the heavens, ama hai—Weeping with emotion I stretch myself out upon the earth,—The good reindeer do the same—Between the mountains one sees them grazing in the dewy distance—Haija haija hai—Oh what delight, what happiness !—Aiija aiija haija hai !"

Still more attractive is the deep feeling for the beauty of nature in the following saga :—

"A seal-hunter in the island Aluk, on the east coast of Greenland, was distinguished beyond all his countrymen for the love of his native home, for he never left it even in the summer time. At the beginning thereof his great delight was to watch the sun rising above the waves, showing, as it sometimes will, a momentary glimmer, and then again disappearing. But when a son that he had grew up, and could not resist the desire to follow his companions on their summer's journey, he persuaded his father to travel with him towards the west. But scarcely had they proceeded so far inland as that the sun appeared to them to rise over the land instead of out of the sea, the father refused to go any farther, but turned back upon the spot. And when they had got back to Aluk, the old man left his tent early in the morning and stayed without. At first they heard his voice, but after a while everything was still, and as his children came out to look for him, they found him lying dead upon the ground, with his eyes turned towards the sun. It was joy that slew him in the very moment when he saw it again rise from over the sea."

A deep feeling for nature can scarcely be more touchingly or more impressively expressed than is the case here. We see, in this respect, too, how essential an exact knowledge of the tales and legends of a people is to the true understanding of its inner nature, and how serviceable Rink's collection is. He also communicates a series of songs, from which the following love-song is taken :

"I turn my gaze ever towards the south—For by the headlands of Isna, by the sea-shore of Isna—He will appear from the south—This is the way that he will choose,—Korsarak will surely come by the headlands,—Korsarak will surely be able to do this ;—But perhaps he will not come—Till the plaice fishing begins—Till one begins to haul in the plaice."

Besides the legends, tales, and songs, of which the two former offer many and startling points of resemblance to those of widely distant lands (as I have pointed out elsewhere, *Heidelb. Jahrb.* 1869, Nos. 7 and 8), Rink has also given us a circumstantial treatise on the means of support and the mode of life of the Esquimaux, on their language, social organization, manners, customs, and usages, their religion, their intellectual condition, the presumable birth-place of their race, and its relationship to other peoples, with, finally, the influence of Europeans upon the natives. I have already quoted some passages from this section, to which the following may be added. Before the arrival of Europeans, the Esquimaux showed scarcely any signs of spiritual development, except in their legendary poetry, and in a certain very limited proficiency in the healing art, in astronomy, and in the computation of time. As for their descent, Rink contents himself with remarking that after much enquiry it has been concluded that the original inhabitants of America do not constitute a race apart, but show, though in a lesser degree, the same kind of variation as the inhabitants of the Old World, so that from the Esquimaux, through their nearest Indian neighbours on the west coast, a gradual transition to the other Indian tribes of North America can be traced. As to the influence of Europeans on the Esquimaux, Rink observes that we have seen so many cases in which the native inhabitants of various

countries have been exterminated by the introduction, through Europeans, of sickness and intoxicating liquors, as well as by open warfare, that it is especially instructive to trace the effect of such contact when the requirements of the native population are most carefully considered, as has been done by the Danes in Greenland. The results unfortunately leave much to be desired, for in spite of all apparent good intentions, in spite of many steps taken for the security of the population, it is still chiefly regarded as an object of religious and commercial speculations. The attempt was made, it is true, to draw a distinction between the traders and the missionaries, but this proves nothing, for in the first place both systems have a common origin, and in the second both together form, as against the natives, a solid and united whole ; so that the ostensible separation only serves as a subterfuge for those who wish to justify their party at all hazards, instead of considering how the actual grievances of the natives can be righted. Without going into the religious situation of the people, still, in spite of all the missionaries, of a very meagre description, it is interesting to learn what constitutes the material prosperity of a Greenlander, and for this purpose we give the inventory of the possessions of a man who was not to be considered exactly poor, as it was taken down at Rink's instigation. He owned a very miserable little house with a clay stove in it, which he shared with eighteen other persons, but he had no boat for long voyages, and no tent. He possessed one *kajak*, with the needful clothes and implements, amongst which were two fish-lines, one rifle, one chest of small tools, two furs with stuff coverings, one coat of coarse cloth, one vest, four pairs of breeches, two pairs of boots, two shirts, and a cap. Of his eighteen house-mates, three possessed a *kajak* apiece and a rifle in common, but all were much worse off for clothes than the head of the household. They were also joint possessors of three lamps and a small fishing-line, and scarcely any other household utensils. From this one can easily form an idea of the possessions of a *poor* Greenlander, which Rink also enumerates ; and yet there are European labourers of whom one could not give a very much better account, even in countries famed for their wealth.

As to the Moravian missions in Greenland, Rink observes that their principal purpose is to procure the society consideration in Europe by advertising its possession of four several stations in that remote country ; and it is remarkable that public opinion has been so far imposed upon as to believe not only that the European residents at them are martyrs of self-denial and self-sacrifice—whereas they really lead a very comfortable life, amongst a submissive population, secured from material cares by their official position—but also that they are the only Christian community established in Greenland, which is quite untrue.

As to school instruction, it is observable that the Greenlanders show great receptivity in other matters than religion, and possess by no means despicable abilities. Attendance at school seems more popular than in other countries, so that reading and writing are as universal as in the most enlightened parts of Europe ; while the higher instruction presents quite respectable results. It is especially remarkable to see how many of the natives combine scientific studies, which they are compelled to pursue under the most disadvantageous external conditions, with the exercise of their national industry. These and some other circumstances which speak favourable for the natural capacity and moral disposition of the Greenlanders give us a ray of hope for their future in spite of many darker shadows. This ray will be the more welcome to the philanthropist as the population has already fallen off frightfully. According to

Egede's estimate in the middle of last century, the population of Danish Greenland amounted to about 30,000; in 1863 it had diminished to 9461, while in Labrador the proportion is still more distressing. These numbers speak for themselves, and confirm the experience made elsewhere of the effect of contact between Europeans and uncivilised nations; so that it would seem the Danish government has not yet hit upon the right method of protecting the native inhabitants of Greenland. I cannot omit this opportunity of referring to an excellent work in which the subject under discussion has been exhaustively investigated. I mean Georg Gerland's book, *Ueber das Aussterben der Naturvölker*, Leipzig, 1868.

Here I must take leave of Rink's very attractive and instructive work, which, besides its other merits, has that of correcting several erroneous statements of Egede's and Crantz's, while its own intelligence may be received with unlimited reliance. Besides this, there are a number of woodcuts, executed by a native artist, to serve as specimens of inland art; also a photographic group of forty-one Greenlanders, partly of pure, partly of mixed descent; and two pretty chromo-lithographs of Greenland scenery, executed by a printer of the latter class. It is interesting to compare these woodcuts with those in Mitford's *Tales of Old Japan*, which were also the work of native artists: these last have certainly a higher degree of technical merit, as was to be expected from the superior antiquity of the art in Japan; but in correctness of proportion and drawing, the palm certainly belongs to the Greenland Dürer. FELIX LIEBRECHT.

*Souvenirs de la Maréchale Princesse de Beauvau, suivis des Mémoires du Maréchal Prince de Beauvau, recueillis par Mme Standish (née Noailles), son arrière-petite-fille. Paris.*

THE princesse de Beauvau was one of the very few personages of the *ancien régime* who lived through the Revolution, until the Empire, without ever varying in her opinions or her conduct. She and her husband, who was fortunate enough to die a natural death in 1793, were amongst the most eminent members of the liberal aristocracy which did so much to make the Revolution possible by protecting "philosophers" from persecution and making enlightenment fashionable. The present volume is a monument of the princess's constancy at once to her husband's memory and to the principles of '89, and it reads rather like the life of a righteous man, for whose sake the city might have been spared, had there been fifty such within it. The memoirs, chiefly compiled by Saint-Lambert, the life-long friend of the maréchal, are practically an apology for the eighteenth century, a plea for the governing classes, that, if they had had time, they would have reformed the government for themselves. It is curious to read a list of the good deeds of Louis XV., though the writer's view of him is substantially that which has since prevailed; but every page gives a fresh illustration of the chasm between the court and the people, which prevented even the virtues of the court reaching those whom they were meant to benefit. The prince de Beauvau was thoroughly upright and conscientious, but half the occasions of his opposition to the crown were mere personalities—e. g. he would not allow his wife to visit with M<sup>me</sup> Du Barry, and the dangers he so courageously encountered were, literally, the royal frown and nothing more. The king showed his displeasure by not speaking when etiquette condemned them to drive out together, and this was political martyrdom; but the country at large naturally never heard of either the offence or its punishment, so it ignored the merits of the victim.

A more important exercise of public virtue was his oppo-

sition to the decree abolishing the parliaments in 1771; as governor of Languedoc, he persisted, in spite of direct instructions to the contrary, in releasing fourteen old women from a life-long captivity in the Tower of Aigues-Mortes, where they had been imprisoned for Protestantism ever since the Dragonnades. In his *discours de réception* at the Academy, he set the fashion which has found so much favour since, of wrapping up a political rebuke in apparently loyal and decorous phrases. It was soon after the disgrace of his friend and relative, the duc de Choiseul, and he took advantage of the usage which obliged him to praise the reigning monarch to praise him for all the measures planned and executed by the discarded minister. Voltaire was delighted with the artifice, and expressed his admiration in one of those wonderful effusions of humility of which he was so fond: "The reed, lifting up its little head, says very humbly to the oak," and so on. After the accession of Louis XVI. the prince was appointed to the government of Provence, and we can readily believe that his administration was just, merciful, and as enlightened as the central authority would permit. He saw that the prosperity of Provence depended on its seaports, and we might never have heard of the *Marseillaise* if a plan which he recommended with some warmth had been adopted. He proposed to bestow on Marseilles the privilege of religious liberty and freedom of trade, so as to attract thither all the commerce of the Mediterranean; the court objected, and he used to say to his wife, "Nous ne sommes pas encore assez mûrs, j'y reviendrai, on s'éclairera;" but unfortunately it was already 1788, and half Aix was starving from the suspension of the Parlement de Provence. His last appearance in history is in 1789, when he was invited to take a place in the council of ministers; he at first made his consent conditional on that of Malesherbes, but an urgent letter from Louis XVI. caused him to reconsider his resolve; he remained in the council for five months, and then passed into retirement. He had never been much in the confidence of the royal family, and though of course he continued loyal to the last, he watched the course of the revolution with melancholy tolerance. His conscience had been troubled long before on the score of feudal and seigniorial rights; he had wished to abandon them formally, but was baffled by an entail, and when the law abolishing them was passed, he hastened to make all the sacrifices it imposed on him. Yet there must have been a good deal of the old aristocratic leaven left, for his wife, who shared all his thoughts, rejoiced in 1795 that he had not lived to see "le désordre et le déplacement de toutes choses," exemplified by a peasant-woman's having money enough to buy a feather bed (p. 108). It is easier to sympathize with her gentle regrets when armorial bearings were made illegal, not that they were necessary to her dignity, but because they had been dear to her since her lost husband's arms were first quartered with her own.

The first half of the volume, the *Souvenirs*, is the expansion of a sentiment which we must let the maréchale express in her own words:—

"Pour expliquer comment deux personnes se sont aimées pendant quarante années, non comme amis, non comme époux, non plus même comme amants, mais comme s'ils n'avoient été créés que pour jouir l'un de l'autre, pour confondre leurs goûts, leurs intérêts, pour trouver de continuel motifs de se préférer à tout, pour ne se quitter jamais sans peine, ne se retrouver jamais qu'avec un plaisir mêlé d'émotion; pour expliquer, dis-je, la nature de cette intime union, il faudroit un nom qui ne convint qu'à elle. Celui de *passion* me semble le seul de ceux que nous connoissons qui pourra en donner l'idée."

This "passion" was nearly as famous in Parisian society as the less legitimate flames of M<sup>mes</sup> d'Houdetot or d'Épinay. When the prince de Beauvau was about thirty-five, a widower with one daughter, he began to frequent the salons of M<sup>me</sup>

de Clermont, one of the most attractive hostesses in Paris, and a lady upon whose reputation even that scandalous age never ventured to reflect; their marriage did not take place till ten years later, when the mature age of the parties added to the piquancy of that rare spectacle, a pair of married lovers. Thirty years of conjugal felicity were followed, for the *maréchale*, by thirteen years of pious devotion to the memory of the departed: her regrets, it has been seen, are expressed with some elegance, and in excellent language; but after all the theme is monotonous, and it must be admitted that we do not read her reminiscences altogether for the sake of the excellencies of him to whom they are dedicated. Other witnesses represent the prince as somewhat cold and formal in manner, scrupulously honourable, with only moderate original talents, but of wide and cultivated intelligence. It was he who said, with the magnificent condescension of a *grand seigneur*, in addressing the Academy, that the king "*voit avec plaisir les personnes de sa cour briguer dans cette compagnie l'honneur de devenir les égaux des gens de lettres.*" Two other anecdotes must complete the portrait. He was dangerously wounded in his first battle, and as he was being carried from the field, an officer stopped to pity "*le jeune brave,*" as he was called in the army. He smiled, and replied by quoting the line—

"Et mes derniers regards ont vu fuir les Romains."

Some years later a French army was besieging Mahon, on the island of Minorca: wine was cheap, and it was found impossible to keep the soldiers sober. The prince de Beauvau suggested the publication of an order forbidding every soldier found drunk from joining in an assault for a week afterwards, and we are assured that drunkenness ceased like magic.

What distinguishes this book from so many other volumes of memoirs is that a single life is the thread which connects these last days of chivalry with the foundation and rise of the new order of things. The traditions of the *grand siècle* were in full force when the *maréchale* was young; she sat at the feet of Voltaire, and was so devout a "*philosophe*" that after her husband's death she refused even to regret "*cette opinion consolante de la réunion dans un autre ordre de choses*" which had not been his. In 1764 she signalled as remarkable a phrase in a parliamentary remonstrance, "*l'opinion commande à la multitude, et la multitude commande à la force;*" and after watching the first warnings of the coming storm, she lived to see it both break and spend itself. Another family memoir gives a very graphic description of the salon in which, true to her old habits, the *maréchale* used to receive her surviving friends under the Empire. Her dress was rich, but of ancient cut; the *cafetière* was gold, the china priceless; the lackeys aged and infirm, but with an air that said they had seen good society, and made their criticism a thing to be dreaded. The *maréchale's* voice was weak, and every one spoke low for courtesy; the company was mixed—some surviving philosophers converted to imperialism, some returned *émigrés*, one or two old and intimate friends. The new men came to give themselves an air of *ancien régime*, the Faubourg Saint-Germain came to show its liberalism, *M<sup>me</sup> de Staël* came to admire the grand old lady who had been her father's friend: but the most welcome guests were still those who could talk about *M. le maréchal*, and encourage her in the pious hallucination that he was not wholly dead while she lived to preserve his memory. Marmontel describes her in his memoirs as "*la femme qui a toujours raison,*" so perhaps we ought to believe on her authority that it was the fault of circumstances and the misfortune of France that the prince did not take a more conspicuous and influential part in public affairs. At any

rate the double chronicle of her constant affection and the life of her lord—it must be admitted that the two are mixed together rather perplexingly—makes a monument with which a greater man might be contented. H. LAWRENNY.

The Life and Labours of Mr. Brassey. By Arthur Helps. Bell and Daldy.

MOST eminent men never have their lives written at all; they are commemorated in the first instance by an amorphous collection of materials for a biography, and then by a series of *résumés* and reflections on the biography which has not been written. Mr. Brassey has escaped the common fate: no one can say that Mr. Helps has given us undigested materials instead of a book; yet he has not given us exactly a life of Mr. Brassey or a history of his labours. Instead he has written the *prolegomena* to a work which is hardly likely to be written, and, if it were, would find fewer readers than the pleasant sketch which he has given of Mr. Brassey's singularly winning character and of the conditions of his vast success. Mr. Helps in one respect was better qualified for his task than almost any writer; he has long been occupied with the problem of organization, and in approaching the life of a great organizer he knew at once what questions to ask. He points out very clearly how all the conditions necessary for the enormous development of railway enterprise had been gradually accumulated in England, and gives an interesting summary of the experience of Mr. Brassey and his agents, of the capacity and idiosyncracies of the workmen of different countries, with the result that the practical cost of labour scarcely varied, among extreme variations of the rate of wages. But the main interest of the book lies in what must have been the attraction of the subject to the writer, in the numerous illustrations which Mr. Brassey's career supplies of the homely wisdom which just evades being commonplace, and almost seems recondite because it is neglected, which has served for so many years to exercise the trained perception of *Friends in Council*. Perhaps the most striking fact is that Mr. Brassey's average profit on his contracts was barely three per cent.; the most edifying is that he seems to have owed his success much more to his character than even to his abilities, great as these were. There were many men who understood the business of railway construction equally well; but he was able to obtain the lion's share of it because he was peculiarly safe, and still more peculiarly pleasant to deal with, and because his good nature and judicious trustfulness enabled him to take work in a sense easily. It is seldom that optimists can point to such a splendid confirmation of the maxim that "*Honesty is the best policy.*" G. A. SIMCOX.

#### LITERARY NOTES.

The Russian government is said to be preparing to publish a complete collection of all autograph letters, orders, memoranda, &c. of the czar Peter the Great, including those of a private as well as of a public character.

The literary remains of the poet Bürger, which have hitherto been withheld from publication, and include letters and poems of considerable interest and value, have now, it is stated, passed into hands which give hopes of their soon being made accessible to the public.

From St. Petersburg we hear of the discovery, near Kertch, of a remarkable catacomb with walls covered with battle and hunting scenes: the sarcophagi are empty, but are supposed to be of Scythian origin, and to date from about the fourth century B.C. The frescoes give an exact representation of the dress-

and accoutrements of a Scythian warrior, which in some respects resembled the old Russian costume.

The free-trade in light literature which the house of Tauchnitz does so much to forward will doubtless end by raising the standard of fiction throughout the inhabited globe, but just at first it gives rise occasionally to criticisms which have a very comical sound when they come back to the native country of writers who are prophets abroad. The *Allgemeine Zeitung* assures its readers that in *Wilfrid Cumbermede* Dr. George Macdonald "discusses the most serious and important life-problems *without ever falling into a didactic tone, or becoming wearisome*." The same reviewer admires the "Sprachgewandtheit" of a novelist for whose interpretation "even the best dictionaries leave us in the lurch." Did the reviewer try the *Slang Dictionary*?

The *Revue des deux Mondes* (August 15) prints some very pleasant letters from Admiral (then Commandant) Page to the wife of the Marquis de la Grange; they were written between 1844 and 1848, from various quarters of the globe, and express very much the feelings which a literary landsman would describe if he were trying to imagine himself in the position of a sailor. The singularity is, not so much that an active and able officer should have leisure for such emotions, but that he should be able to express them with as much ease and propriety as if they were unreal.

In a paper read before the American Philological Association, Mr. Trumbull gave a respectable Indian etymology for the much-discussed and much-abused word *caucus*. It comes from an Algonkin root, signifying "speak, encourage, instigate"; the least corrupted form of the word is *kaw-kaw-wus*, plural *kaw-kaw-wus-sough*, "caucusser," "counsellors, council"; the Virginians, out of the same word, made *cockarouse*, a name for the chief man in a tribe. As the settlers were fond of adopting native names for their political gatherings, the suggestion seems highly plausible.

We understand that Mr. Morris's early poems (not *The Defence of Guinevere*) will be reprinted about Christmas, with an equal quantity of new matter.

#### THEOLOGICAL NOTE.

Mr. Henry Dunn, in his last work (*The Churches an History and an Argument*; Simpkin, Marshall, and Co.), has carried the idea of Protestantism as purely individual Christianity nearer to complete logical development than any previous writer. He maintains that the Christian societies we find in the New Testament, though divinely organized, were provisional, and lost their *raison d'être* when inspired men had disappeared, and the inspired writings had been collected. Since then all associations between Christians exist only *jure humano*, and are most useful when we recognise that they are optional. The writer is a continuator of John Foster and of Isaac Taylor, the author of *Antient Christianity*. He spends much perverse ingenuity on the theses that the Lord's Supper was originally an household rite, and that Baptism is essentially a profession of faith, though there is some plausibility in the guess that there may have been a time when it was only administered to converts. The writer believes that the object of the Christian dispensation is to train the elect to take part in the subjugation and renewal of the world after the Second Advent; and that the object of the hierarchical organization of the church was to convert the world prematurely and superficially. So far as we can admit a deliberate change, the object was rather to fix and maintain the faith. Mr. Dunn insists, not without reason, that the traditional compromises inevitable in an organized society have to some extent lowered the Christian ideal, but he takes no account of the extent to which the standard of conventional propriety has been, and is being, raised, nor of the danger that, if everybody were left to make his own compromise with the ideas, the practice of half believers would be lower than it is. As the writer makes the personal union of the individual believer with the person of Christ the essence of Christianity, he ought in consistency to have rejected the traditional Protestant notion of the unique supremacy of Holy Scripture, as he has rejected the traditional Protestant notion of the sacramental value of

preaching. He is too unfamiliar with scientific investigations to put his views in a form to be enforced, or even seriously discussed; but he has a refinement and distinction of mind which are often the fruit of sustained and solitary earnestness, and these make what he says not unworthy of attentive consideration.

#### Art, &c.

##### THE DRAMA IN PARIS.

THE great heat has closed most of the Parisian theatres. The Comédie Française, however, remains open, and is giving several very interesting works, among which *Le Chandelier* of Alfred de Musset holds the chief place. This audacious but beautiful play was first performed in 1848 at the Théâtre Historique (now the "Porte St. Martin"), and transferred to the Française two years afterwards, where, after a few representations, it was forbidden by the censure. Now, however, its own intrinsic merit, and the talent of the actors who interpret it, seem to promise it a long and prosperous existence. The story is simple enough. A bold dragoon, Capitaine Clavaroche, is quartered in a country town. The café is dull, the theatre indifferent; he therefore turns his attention to his neighbours' wives, and wins the favour of Jacqueline, wife of the local solicitor, Maître André. The lovers are on the brink of discovery when the captain's somewhat dull intellect suggests to his mistress the idea of selecting a "chandelier": that is, a young man who shall be admitted to her confidence up to a certain point, and no farther, so as to divert all suspicion from her real admirer. Her choice falls on the youngest of her husband's clerks, Fortunio, a boy of eighteen, who has long loved her in secret. The end is not hard to guess. Fortunio is generous and clever, Clavaroche selfish and dull—a difference which the lady is not slow to observe, and makes her choice accordingly. Of this work, rather a poem than a drama, Fortunio is the central figure. De Musset seems to have set himself to draw a boy of a generous, high-spirited character, in all the glow and ardour of his first love. His heart is full of a respectful passion for his beautiful mistress, whom he worships at a distance, as a being of another world: his joy knows no bounds when he thinks his love returned: he is broken down with wild anguish when he discovers why he has been tempted to think himself preferred: but in all his passionate outpouring of sorrow and reproach, there is no thought of mean revenge; she has broke his heart, but he loves her as truly as ever, and is ready to make any sacrifice to prove it. This difficult character is realised by M. Delaunay with singular ability. He is at least forty-eight years old, but manages to look and move as if he were barely eighteen, and even to infuse a certain boyish eagerness into his voice. The tone and manner in which he gives the long speech in which he muses upon woman's faithlessness and his own wretched lot is quite indescribable. It is a bitter cry of despair, coming straight from the depths of a generous heart, that has learnt for the first time that smiles may deceive, and vows be false. More admirable still, if possible, is the last scene, where he upbraids Jacqueline, less in anger than in sorrow, and faints away at her feet, worn out by his emotion. M<sup>me</sup> Madeleine Brohan is a charming Jacqueline, and M. F. Febvre realises the rough sensual Clavaroche most completely.

The Orestes of Mounet-Sully, the young actor whose *début* at the Théâtre Français has been so successful, is unquestionably a remarkable performance. In the first place, it has brought four or five thousand people together twice a week to see one of the most stilted and dreary tragedies of the classical epoch, the *Andromaque* of Racine, which is of itself no small feat: and it raises them at times into genuine enthusiasm. One would like to know, however, whether any one has gone a second time! The actor is a strong, well-made, handsome young fellow—rather too fond, perhaps, of showing off his personal attractions, especially a pair of muscular and not ungraceful arms. He has been thoroughly well taught, and knows how to turn his lessons to the best account. The result is a performance of much vigour and intention, rising at the end into a stately pathos when Orestes, stung by the reproaches of Hermione after the murder of Pyrrhus, becomes mad. But from the beginning to the end the character is so unsympathetic that one cannot do more than admire the art, while one regrets the fustian on which it has been bestowed. From such a commencement it is impossible to predict the future. He may be a great artist, or he

may not. To tell him, on the faith of what he has already done, that he is a second Talma, as the French critics are doing, is as absurd as it is unfair to him. The result may be, if he is not wiser than they are, that he will rest contented with his first success, and make no further progress. He is to appear next in Corneille's *Cid*, and afterwards in one of Victor Hugo's dramas, either *Hernani* or *Marion Delorme*, probably the latter. Either will give him an excellent opportunity of showing what his real talents are. An adaptation of *Othello* is said to be also in preparation.

J. W. CLARK.

Paris, August 22.

## ART NOTES.

A special commission was appointed under the Empire to report upon the Fine Art collections deposited in the museum of the Louvre, with a view to relieving the overcrowded state of these collections by making from them a selection of works which might be properly entrusted to other museums or to buildings of a sacred character. This commission has now finished its labours as far as they concern the paintings which are to be removed: the total number of which is, as stated by M. Charles Blanc in his report recently published in the *Journal officiel*, 885. Of these, 180 are of the Italian school; 50, of the Flemish and Dutch schools; and of the French, 655. The Italian are for the most part copies, or works of the second and third class; the same may be said of the Dutch and Flemish, and of a large proportion of the French. Where the works are attributed to a good name, it is invariably a doubtful attribution. As soon as these paintings have left the field clear by their departure for the provinces, the commission will proceed to attack the terracottas, ancient and modern sculpture, enamels, vases, and Egyptian antiquities. All the works purchased by the department of the Beaux-Arts at the recent Salon are to be submitted to the approval of the public before distribution.

M. Champfleury is about to publish his *Souvenirs et Portraits de Jeunesse*. The volume will contain a biography of Courbet, of Bonvin, and others, the materials for which have been furnished by letters and personal intimacy.

Henry Trappes, who is well known by his etchings, and chiefly by his illustrations to *Gil-Blas*, recently committed suicide, it is said in despair at some family complications. He was hardly thirty-seven years old.

The great exhibition at Milan opened on August 26. The artistic congress held in connection with it took as its principal question for debate the teaching of drawing in so far as it may be made a portion of primary instruction. The inauguration of the monument erected by the Milanese to Lionardo da Vinci took place on the 28th.

The École des Beaux-Arts is making rapid steps towards importance amongst the museums of Paris. As soon as the library was commenced, M. His de la Salle presented to it a hundred drawings selected from amongst the most valuable in his collection. M. Gatteaux also bequeathed all his books, his drawings and engravings. M<sup>me</sup> Bertin has now enriched the collection by the gift of eighteen drawings which were accounted amongst the finest of those which figured in the posthumous exhibition of her brother's works, the last of the French landscape painters who held by the traditions of Poussin, and, it may be added, of Francisque Millet.

The first half of the second volume of Andresen's *Handbuch für Kupferstichsammler* has just appeared. It has been edited and completed since the death of the author by J. E. Wessely. The two other unfinished works left by Andresen, viz. *Der Deutsche Peintre-Graveur* and *Der Deutsche Malerradierer des 19. Jahrhunderts*, have also been undertaken by the same writer.

It is said that the architects Bohnstedt, Kaiser and Grossheim, Ende and Böckmann, Mylius and Bluntschli, have been invited to take part in the final competition for the German Houses of Parliament. Their new plans are to be sent in April 1, 1873.

Hans Makart, Alma Tadema, August Pettenkofen, Franz Defregger, Oswald Achenbach, and Caspar Zumbusch, are on the list of those recently confirmed as honorary members of the Munich Academy of Fine Arts, by the king of Bavaria.

The *Zeitschrift für bildende Kunst* for August 9 contains an article on "Barbarian Types depicted by the Ancients," by Professor Conze, illustrated by a lithograph from a marble supposed by the writer to be the portrait of a German woman, now preserved at St. Petersburg in the Hermitage.—Carl Justi concludes his essay on Philipp von Stosch and his time; and Bode's notes on the artists of Haarlem also come to a close.—H. Ludwig ends his paper on the uses of petroleum in oilpainting.

In December 1862, Herr Oberstlieutenant Pfau of Winterthur came into the possession of one of the many repetitions of that composition of Raphael's which is well known by the name of the Madonna di Loretto. The apparent merit of this particular example has caused a claim to originality to be put forth on its behalf. The grounds on which this claim may be supported, together with much interesting matter relating to the history of the painting in question, will be found in a little book entitled "*Die Madonna von Loretto—eine kunstgeschichtliche Untersuchung von S. Vögelin*," published at Zürich in 1870.

The death of M. Charles Duron has just taken place at Paris. M. Duron, born in 1814, at Pont-à-Mousson, was a distinguished artist in enamel. Some of his happiest works became the property of the Marquis of Hertford, and of Baron Rothschild.

Professor E. Magnus, born at Berlin, 7th January 1799, has just died there at the age of seventy-three. Professor Magnus was a pupil of Schlesinger, whose valuable studies after the Sixtine Madonna he recently presented to the print room of the Royal Museum. He especially excelled in portraits; nearly all the princes and notabilities of Germany have been painted by him. His portraits of Jenny Lind, of the Countess de Rossi-Sonntag, and of Mendelssohn, were exhibited at the Paris Universal Exhibition in 1855.

The jury for the Berlin Goethe memorial have awarded the three prizes offered, to the sculptors Adolph Donndorf, of Dresden, Fritz Schaper, and Rudolf Siemering, of Berlin. These three artists are invited together with Alexander Calandrelli to take part in a final competition.

Oberlieutenant Joseph Reiter, commandant of the fortress of Klissa, in Dalmatia, has been named corresponding member of the Institute for Archaeological Correspondence at Rome, as a grateful testimony to the services rendered by him in the preservation of two Roman sarcophagi in the neighbourhood of Salona.

The largest and most important of the fragments of the carved column dug up by Mr. Wood, on the supposed site of the temple of Diana at Ephesus, has been set up in the Graeco-Roman room at the British Museum. It measures about 6 feet in height, and 18½ feet in circumference; and is supposed to have formed a portion of the first drum of one of the thirty-six Ionic carved columns which, with ninety-one others, supported and adorned the edifice. Portions of the base and capital of the column were found close by (*Academy*, vol. iii. p. 285). On the side of the drum there are five figures which, though not without intrinsic merit, derive their chief beauty from the admirable architectural intention which is manifested in the treatment and grouping. All are more or less mutilated, but there are sufficient indications to identify one as Mercury, and another as Victory.

A new bust of Mr. Gladstone is on view in the great hall of the Reform Club. It is by Mr. J. D. Crittenden, whose "Christ anointing the Eyes of the Blind" was one of the works in the sculpture room of this year's Royal Academy exhibition.

In repairing the roof of Dumfriess House, Ayrshire (formerly the property of the Earls of Kilmarnock, but now in the possession of the Marquis of Bute), some workmen discovered two half-length portraits rolled up, and hidden in the rafters. On

examination one proved to be the portrait of the Earl of Kilmarnock who was executed for rebellion in 1746; and the other after some difficulty was identified as that of John Drummond, Earl of Melfort, outlawed in 1694. These portraits had been removed from their frames and hidden away in consequence of the political peril formerly attaching to their possession. Another portrait of Drummond, engraved and published by Vanderbanc, was named, not Melfort, but Lundin, Lady Melfort's family name—the name of Melfort being tabooed.

A collection of original drawings by William Blake has been sold recently by Messrs. Sotheby and Wilkinson. The collection consisted of—the set of twelve illustrations to Milton's *Paradise Lost*, which fetched 100*l.*; the set of eight illustrations to Milton's *Comus*, 20*l.* 10*s.*; the set of six illustrations to *The Hymn*, 53*l.* On the same occasion, an early drawing by W. Hunt, "The Cottage Door," 41*l.*, and "Childe Roland," by Burne Jones, 42*l.*, were also disposed of. To the same firm was entrusted the sale of the valuable library of Mr. André Knox, which took place August 14 and five following days. One of the most interesting of the many fine illuminated MSS. which were then disposed of was *Horae Beatae Mariae Virginis*, 4to—a beautiful MS. of the fifteenth century, on vellum, with thirteen large paintings, every page ornamented with borders of great elegance in design, capital letters, &c. This volume was formerly in the possession of Samuel Rogers, who attributed the work to Oderici, the contemporary and friend of Giotto and Dante, and it contains an MS. note in Mr. Rogers' hand. It is bound in morocco, with the cypher of Charles II., of whose collection it once formed part, stamped on the back and sides. 98*l.* Messrs. Sotheby also disposed of the collection of coins and medals of the late Wm. Jackson, of Lancaster. Some of the most valuable pieces were the following:—a gold octodrachm of Ptolemy III., 26*l.*; an octodrachm of Ptolemy V., 29*l.*; of Ptolemy VIII., 24*l.*; a pattern five-piece of George III., by Pistrucci, 21*l.*

### Physical Science.

**The Morphology and Physiology of Plants.** [*Botanische Abhandlungen aus dem Gebiet der Morphologie und Physiologie.* Herausgegeben von Dr. Johannes Hanstein, Prof. der Botanik an der Universität Bonn.] 1870-1871.

[SECOND NOTICE.]\*

IN turning to the memoirs, two of which form the subject of the present notice, the first relating to the development of the Embryo in Phaenogams, the second to the structure and fructification of Diatoms, it will scarcely fail to be remarked that where the subjects are at all cognate, much advantage will be derived from reading them in connection. Indeed, as the paper on the development of the radicle by Reinke was prepared under the express supervision of Dr. Hanstein, the author of the important memoir with which the series was opened, and which now comes under revision, the two may almost be considered as emanating from the same source, and I have no hesitation, from my own experience, in stating that Reinke's observations are an excellent preparation for the full understanding of his superintendent's larger and more important dissertation. Undoubtedly the whole is well worth a careful study, but no one point seems to me of greater interest than the development of the embryo of Brachypodium, because it completely settles the theory which was originally broached by Richard

as to the nature of the organ called by him vitellus, and which I confess that I had long considered as true. If this is regarded as the primary radicle, the subsequent ones being all adventitious, Gramineae are placed in the same category as other Monocotyledons, in the greater part of which the primary radicle is evidently exorhizal. On following out, however, the gradual development of the embryo from its earliest stage, it becomes quite evident that the first rootlet is endorhizal, and that the so-called vitellus is really an absorbent portion of the cotyledon. This is, in fact, in accordance with what takes place in some palms, the onion, and other cases, where a portion of the cotyledon remains in contact with the albumen long after the development of the radicle and plumule, deriving nourishment from it for a considerable time, while the development of the embryo of Brachypodium is almost exactly like what occurs in *Tropaeolum*, where even the suspensor can readily be traced in the ripe seed just at the point of germination, and where the real primary radicle bursts through the hood (Haube) exactly as in Brachypodium. The nomenclature adopted by Reinke, though somewhat complicated, is really of value in indicating the true relations of the several parts of which the descending axis is composed.

As regards the second memoir, on Diatoms, by Dr. Pfitzer, we have in it a full confirmation of the important observations which were made by Mr. Thwaites† before leaving England for Ceylon, and which at once settled the question as to the vegetable nature of these singular organisms. The point of especial interest in the paper is the elucidation of the mode in which the two portions of the outer siliceous envelope overlap each other, thus facilitating the multiplication of the individual as distinct from the fructification. Few matters are more interesting as regards microscopical observation than the mode of propagation, and where the different species of Biddulphia can be readily procured as on our southern coasts, they will afford ample food for many a morning's investigation. The two original halves remain exactly *in statu quo*, and it would be interesting to know how long they would subsist while new intermediate frustules are developed; and the same observation applies to many Desmidiaceae. It is much to be wished that these very useful and important memoirs should receive such encouragement as may ensure their continuance. The Ray Society would do well to include them in the number of their acceptable translations. M. J. BERKELEY.

### Notes of Scientific Work.

#### Geography.

**Central Africa.**—The whole of the geographical information contained in the numerous letters written by Dr. Livingstone and safely brought home by Mr. Stanley, has by this time been sifted, and as the great traveller has turned back into the mysterious central land of Africa, our knowledge of his accomplished work will in all probability remain at its present stage for a long period. Until the explorer shall himself appear to confirm or correct what he has given us, the geography of equatorial Africa will rest on Livingstone's own data. The discussion by geographers at the British Association and elsewhere, of the outlines of information thus vouchsafed, has wrought great changes in the accepted hydrography of the land. Before these letters arrived, it was believed that the Nile had a main tributary at least in the Tan-

† The whole subject of Cryptogamy is deeply indebted to Mr. Thwaites for the patient investigation he was able to devote to it before leaving England. Amongst other matters, his memoir on the gonidia of Lichens in *Annals of Nat. Hist.* ser. ii. vol. iii. p. 219, will be read with interest, as anticipating those of Schwenderer in *Nägeli's Journal*, though taking a far more rational view of the subject than that which supposes that Lichens are Fungi parasitic on Algae. Cohn has lately called in question the justice of Schwenderer's views in the *Botanische Zeitung* (March 1873); but he is wrong in supposing the threads in Palmellae are always extraneous. A comparison of Mr. Thwaites' observation on *P. beryoides* in the same journal (vol. i. p. 312), as confirmed in Berk. *Intr. to Crypt. Bot.* p. 399, will be sufficient to show the connection of the threads and spores. A similar structure prevails in the gonidioid cells of the anomalous genus *Emeticella*, *l. c.* p. 341.

\* See *Academy*, vol. iii. pp. 188, 189.

ganyika Lake and its feeders far south of the equator; for a connection had been traced on apparently good grounds between this basin and the Albert Lake and the Nile by an outflowing river. The Chambeze-Luapula of Livingstone with its lakes might also, so far as our information then went, prove to be the head of the Nile, though probabilities were in favour of its being rather the headstream of a river flowing westward. We learn now from Livingstone and Stanley that the Tanganyika is not in the Nile basin; its outlet (for being a lake of perfectly fresh water, it must have an outflow) is not to the Nile; but it is highly probable that its discharging river is the Lufji, on the east coast. Moreover, taking Livingstone's own measurement of the level of the great Chambeze-Lualaba system that he discovered, at its furthest point, the river could not be the Nile, for it is here exactly the same height above the sea as Gondokoro, known to be on the Nile, 800 miles away. The Lualaba could not join the Albert Lake, as it lies upwards of 500 feet above the given elevation of the river, not to mention the very mountainous country of Ulegga, spoken of by Speke, Baker, and Livingstone, which intervenes to prevent it. Dr. Schweinfurth's explorations, carried on contemporaneously with those of Livingstone in Manyema, by tracing the rivers forming the Bahr-el-Ghazal to their sources, have shut off the only inlet which seemed possible to Dr. Livingstone himself. The conclusion is evident that Livingstone, though searching for six years with this object in view, has never once seen the Upper Nile at any point. It has been suggested that a great inland lake may receive the waters of the Lualaba, but such a continental system in the equatorial forest region of Africa, saturated by double rainy seasons, is a physical impossibility. Any lake in this belt must overflow. The only outlet on the west coast, capable of discharging such a volume of water as that accumulated by the Chambeze-Lualaba and its lakes, is the Congo; and the second conclusion forced upon us is that it is the Upper Congo river which the great traveller has now made known.

**Upper Nile.**—The results of Dr. Schweinfurth's latest remarkable journey in Dar-Fertit in the beginning of 1871 are fully described in the current part of *Petermann's Mittheilungen*. In former journeys Dr. Schweinfurth had explored and mapped out the source country of the Rohl, Tonj, and Jur tributaries of the Nile rising westward of Gondokoro. These rivers flowing northward unite in the Bahr-el-Ghazal, which joins the Nile above the ninth parallel of north latitude, and have hitherto been considered as the chief streams of this lateral system. In his last journey, however, the traveller, by going westward, has crossed the upper streams of a river named the Abu Dinga, which he identifies clearly with the Bahr-el-Arab, a tributary of the Ghazal formerly considered to be of small importance, but now proved to be the longest and largest branch of the Bahr-el-Ghazal system.—Ernest Marno, a traveller in Upper Sennaar, has sent to Gotha a full report of his journeys in this region during 1870–71, and a most valuable map, which it is said will add greatly to our knowledge of the territory of the Abyssinian Nile. His letter from Khartum of the 6th December 1871 brings the following intelligence:—Great political changes have recently taken place; Jaffar Pasha has been deposed from the ruling power in Sudan; Muntas Pasha has obtained the government of the districts of Khartum Fashoda (Bahr-el-Abiad), and Sennaar; Kordofan, Taka, and Dunga, with Berber, have each received a separate ruler. The government recently seized upon a number of slave boats, and slaves to the number of from 3000 to 4000 were brought to Khartum. No provision having been made for such an influx, the greater number died within a few days. Muntas Pasha had not arrived, the remaining officials did not trouble themselves in the matter, and soon the dead lay before every house and all along the river banks, a fearful epidemic among the settled inhabitants being the result.—The most varied reports are in circulation respecting Sir Samuel Baker's expedition, but this at least is certain, that he is still (in Dec. 1871) at Jebel Redjef, not far from Gondokoro. In consequence of the great number employed, the expedition encountered great obstacles, that increased as it advanced into the less known country; the troops have been so greatly reduced and demoralised by sickness and hunger that it is the opinion in Khartum Baker must soon return.

**Western Mongolia.**—The active exploration by the Russians during the last few years of the geography of the region of Mongolia lying next to their Siberian possessions, and the establishment of new relations, political and commercial, with these countries, would lead us to suppose that the annexation of these lands to the great empire is seriously contemplated. A very important map of this region accompanies the last part of *Petermann's Mittheilungen*. It is based on Klaproth's map of Central Asia, which was drawn from the surveys made by the Jesuit missionaries of Pekin by order of the emperor Khian-loung, and upon that of M. Veniukov which accompanied the seventh number of the *Izvestija* of the Russian Geographical Society for 1871; but the map is filled in and greatly amended from the journeys of the Russian travellers Schismarev (1864–65), Palinov, and Matusovski (1870), containing besides a reconstruction of the routes of Prinz (1863) and the artist Atkinson, so far as they bear upon this part of Asia. These tracks cross Mongolia in sufficiently various

directions to form a trustworthy basis on which the detailed topography of this inner Asiatic plateau may now be accurately laid down.

**Morocco.**—Though formerly little visited by Europeans, this country has of late attracted many explorers, as the names of Rohlf, Gubernatis, Balanza, Beaumier, Lambert, Gatell, Blackmore, Hooker and Ball abundantly testify. The French military expedition under General Wimpffen from Algeria to the Wady Gir in Morocco, during March, April, and May of 1870, also form the subject of an essay in the *Mittheilungen*. The primary object of this undertaking was the dispersion of the armed bands that harassed the people of the Algerian Sahara, the most powerful of which, the tribe of the Dui-Menia, had their home in the Wady Gir, not far north-west of the oasis of Taflet. The map accompanying the paper, in which the line of march of this expedition is seen almost to join the route made known by Rohlf in 1861–1864, shows that great gain to geography has also resulted.

An *Abstract of the Reports of the Surveys and of the other Geographical Operations in India for 1870–71*, just issued, contains an interesting chapter on recent geographical exploration. In continuation of his plan for systematically exploring the countries beyond the British frontier, Major Montgomerie despatched a trained Pathan Havildar of Sappers direct from Peshawur to Faizabad, the capital of Badakshan. This interesting tract of mountain land between the Indus and the Kabul rivers, bounded on the north by the Hindu-Kush and Mustagh ranges, had been sealed to all attempts at exploration. The Havildar crossed over from Yusufzi into Swat, went thence to Chitral, then up the lofty and difficult Nakshan pass to Zebak on the Upper Kokcha, and descended the valley to Faizabad. He fixed the positions of the Nakshan and Dora passes, and took latitude-observations at five points. His route survey is 286 miles in length, and has opened out 13,000 square miles of hitherto unknown country.—During the autumn of last year, Mr. Blanford, of the Geological Survey, examined the eastern and northern frontiers of British Sikkim, reached the Donkia pass, 18,500 feet above the sea, ascertained the position of another pass never before marked on any map, discovered three unmapped lakes, and made a good collection of birds.—Our knowledge of the geography of Persia has also received valuable additions. Captain St. John, after co-operating with Col. Walker in determining the longitude of Tehran, has fixed the latitudes of places between Shiraz and Tehran, correcting an error of ten miles in the position of Kashan, and has completed a survey of the Elbourz Mountains. Meanwhile Major Lovett has made a journey from Shiraz to Kerman and Bam, and corrected the position of Niviz, an important place at the eastern extremity of the valley of Persepolis. From Niviz the road traverses a pass, 5,640 feet above sea-level, over the range of Loivez hills, a mountain-chain requiring thorough geographical and geological exploration to its termination near the shores of the Persian Gulf. Beyond these hills is the desolated valley of Kotro stretching away in a direction south of east, with no visible limit. Major Lovett travelled thence to Khairabad, at the foot of the Tung Chal, a granitic range, and, crossing at an elevation of 8000 feet, reached Kerman. He then journeyed north-east to Khabis, and corrected the mistaken position of this place on Pottinger's map. Khabis, the terminus for kafilahs proceeding across the deserts to and from Seistan or Meshed, abounds in fruit, including eleven kinds of *Aurantiaceae*. The surveys of St. John and Lovett have furnished valuable materials for a new map of Persia.

The *Zeitschrift der Gesellschaft für Erdkunde zu Berlin*, No. 38, contains an elaborate paper by Dr. Neumayer on the exploration of the South Pole. He has prepared a full *résumé*, extending over fifty pages, of the literature of the subject, illustrated with a very good map, and given the details of a scheme which he laid before the Geographical Congress at Antwerp for prosecuting a further exploration of that region. He proposes that it should be combined with an expedition to observe the transit of Venus, and, starting from the Cape of Good Hope, and making the M'Donald Group head-quarters, should endeavour to push on from Kemp's Land toward the pole. The essay has since been published in a separate form.

### Physiology.

**The Influence of the Central Nervous System upon Animal Heat.**—A very interesting essay on this subject containing the results and details of many experiments has just been published by Dr. Franz Riegel in *Pflüger's Archiv für die gesammte Physiologie* (No. 12). Dr. Riegel first repeats and corroborates the generally known fact that division of the spinal cord in the neck, opposite the sixth cervical vertebra, is followed by a steadily progressive diminution of temperature. The cause of this fall of temperature might be attributed to paralysis of the vasomotor nerve, leading to dilatation of the vessels and consequent increased evaporation and exposure of the blood to the cooling influence of the air; or it might be due to this cause, combined with diminished production of heat within the body of the animal; or, lastly, it might be due to a proportionally increased loss of heat, though the production of heat be augmented. Riegel set himself to determine which of these

views is correct. For this purpose, control experiments were requisite on every point: on the effects of chloroform and of morphia injection; of keeping the animal in a warm room; of binding it; of the frequency of the respirations, which are greatly diminished by section, &c. He agrees with Tscheschichin that there is no increased internal development of heat after section of the cord, and that the fall in temperature is to a certain extent due to the dilatation and increased evaporation from the cutaneous vessels. But he even goes beyond this, and considers that there is an absolutely diminished production of heat in an animal after section of the cord, and that all his experiments favour the view that the application of heat to the peripheric cutaneous nerves constitutes an excitation which travels centripetally to the respiratory centre, and acts reflectorily upon it. The healthy animal possesses in this reflectorial excitation of the respiration a highly important heat-regulator, and it is consequently easily intelligible why the external application of heat, if this regulator be not annulled, causes no rise of temperature in the healthy animal. This reflectorial increase in the rapidity of the respiration explains why other observers in their researches on "the effects of external heat" have observed no increase of temperature in uninjured animals. Division of the spinal cord removes the channel the more perfectly the higher the section is made.

**The Gases of the Blood.**—MM. Mathieu and Urbain contribute to Brown-Sequard's *Archives de Physiologie* (No. 2) the results of their enquiries into this subject, especially in regard to the proportion of gas contained in the blood of different arteries. The researches of Claude Bernard have shown that the quantity of gas contained in venous blood varies with the condition of activity or of repose of the organ whence it proceeds. Though the greater or less amount of oxygen absorbed by the tissues explains these variations very well, a second interpretation has been proposed, namely, that the diminution of oxygen in the blood is due to intra-vascular oxidation taking place at the expense of the blood itself. On this view the oxidation which is well marked in the veins commences in the pulmonary capillaries, and continues in the arteries, causing a gradual disappearance of the oxygen, the loss attaining its maximum in the veins. As a consequence of this, the arterial blood does not everywhere present the same composition. MM. Estor and St.-Pierre actually concluded from their experiments that whilst the blood of the carotid contained 21.06 per cent. of oxygen, that of the crural artery contained only 7.62 per cent., so that 13.44 per cent. of oxygen disappears in the course of a second or two; the authors attribute this sudden change to the occurrence of incessant intra-vascular oxidation. MM. Mathieu and Urbain's experiments may be divided into two groups: first, those in which the proportion of gas contained in the blood of arteries of nearly equal diameter was compared; and, secondly, those in which that from arteries of different calibre were examined. As regards the former, they found that no remarkable difference could be detected between the carotid and crural artery: in one case, for example, the proportions were for the carotid, oxygen 20.45 per cent., nitrogen 1.64 per cent., carbonic acid 48.18 per cent.; and for the crural, oxygen 18.03 per cent., nitrogen 1.60 per cent., carbonic acid 44.23 per cent., the slight difference being due to the effect of the first bleeding. On the other hand, in comparing the blood of large with that from small arteries, the amount of oxygen in the former was invariably greater than in the latter, the difference sometimes amounting to 3 per cent.

**The Anatomy of the Spleen.**—M. Wedl, in a paper contained in the *Sitzungsberichte der Wiener Academie*, vol. xiv. pt. 1, observes that it is not difficult to inject the veins of the spleen, and exhibit the venous ramifications by the corrosive method. When the spleen of a sheep is thus treated, the following appearances are seen:—Each main vein with its dilatation receives branches opening into it peripherically, and these again receive numerous branches from certain intermediate spaces. These branches are sometimes so minute that they can only be discerned with a lens. The angle of entrance of each set of vessels into the larger ones is nearly the same, as well as the distance from one another, so that a branch resembles a small cone beset with prickles. He was unable to discover the venous plexuses or anastomoses described by W. Müller. Another mode of examination he adopted was to fill the vessels with coloured solution of gelatine, and then to harden this with alcohol, which process allows of fine sections being made. At the points where the veins present constrictions, processes may be seen by this means to pass into the cavity of the diverticula of the veins. These processes are of two kinds: one a papillated inflection of the venous wall; the others are trabeculae forming incomplete septa. Wedl found, as Gray and Frey have done, no venous rootlets within the Malpighian corpuscles. As regards the epithelium demonstrated by Billroth in the delicate veins of the pulp, Wedl always found it complete, never discontinuous, as stated by Frey. His investigations show that the blood path is also continuous, the blood passing from the arteries into capillaries, and thence into veins, and not at any point through lacunae of the tissue.

**On the Coagulation of Fibrin.**—A. Schmidt (*Medicinisches Centralblatt*, No. 16) finds that, in blood drawn from the living vessels, a

ferment originates from the action of the blood corpuscles which causes the coagulation of fibrin. The material for the fermentation is afforded in the fibrinogenous and the fibrinoplastic substances, which must be simultaneously exposed to the action of the ferment in order that the fibrinous coagulum may be formed. The action of the blood corpuscles upon the fermentation process is dependent on the haemoglobin, though other substances that condense oxygen upon their surfaces and catalytically decompose peroxide of hydrogen act in the same way, such as spongy platinum, carbon, &c. The transudates found in the cavities of the dead body for the most part contain the two fibrin generators, but no ferment, and they will coagulate on the addition of the ferment. In some the fibrinoplastic substance is absent, and requires to be added before coagulation will occur. Neutral alkaline salts and low temperatures arrest the process. To obtain the ferment, the albuminous substances of the blood must be coagulated by maceration for fourteen days in concentrated alcohol; the fluid is then filtered, and the residue on the filter dried at a low temperature, pulverised, and extracted with glycerine.

**The Structure of Striated Muscle.**—Four papers have recently appeared upon this subject: one by J. H. L. Flögel, in *Schultz's Archiv*, viii. 69; a second by W. Dönitz, in *Reichert und du Bois-Reymond's Archiv*, 1871, 434; a third by G. Wagener, in the *Marburg Sitzungsberichte*; and a fourth by F. Merkel, in *Schultz's Archiv*, viii. 244—discussing the structure of the primitive muscular element of Articulata. Flögel gives a description of the muscles of a species of Trombidium (a small arachnid, of which the common minute red spider of gardens is an example), and states they are composed of a series of compartments divided from one another by septa which from wall to wall contain: (1) a simple and feebly refracting substance, which strikes a slight tint with perosmic acid; (2) a granule which, with its neighbours on either side, forms the granule layer, and is strongly stained by perosmic acid; (3) another layer identical with the first; (4) the double and strongly refracting substance which becomes deeply stained with the acid; (5) the same as the third layer; (6) the same as the second; and (7) as the first.—Merkel agrees with Flögel in considering that the fibres of muscle are divided into compartments (Muskelkästchen) by transverse septa.—Dönitz, on the other hand, returns to the old view that the primitive morphological element of the muscle is the fibril and not the compartment. His researches appear to have been chiefly made on the Crustacea.—Wagener admits the existence of Hensen's intermediate stria, but adds that there are from two to eight secondary ones which are constantly present, but are very fine. He describes the act of contraction in the following terms. The anisotropic and doubly refractive substance, with the intermediate stria of Hensen and the adjoining striae, contract and approximate to one another, and then the two isotropic and singly refracting striae, originally separated by the broad anisotropic band, become so compressed together that they are only separated by a single feebly marked line.

### Anthropology.

**Etruscan Antiquities found in Belgium.**—A Belgian antiquary, M. H. Schuermans, calls attention (*Bulletin de l'Académie royale de Belgique*, p. 528) to certain objects found in a tomb at Eygenbilsen, north of Tongres, in 1871, viz. (1) a fillet of gold; (2) a cylindrical cista of bronze; and (3) an oenochoe of bronze, with the figures of two fabulous animals confronted on its neck. There appears to be no doubt that the articles in question are of an Etruscan character. But it is very rash on the part of M. Schuermans (as his critics, MM. Roulez, Wagener, and de Witte point out, *ibid.* p. 513) to conclude that they must have found their way from Etruria into Belgium previous to the displacement of the original Celtic population by the Germanic race which Caesar found in possession of the district where the recent discovery took place, seeing that his argument relies on a series of combinations which are anything but satisfactory. In the first place, it is not just to take the statement of Caesar (*Bel. Gall.* i. 1) with regard to the Belgians generally *minimeque ad eos saepe mercatores commant*, in the sense of *nullum aditum esse ad eos mercatoribus* afterwards (ii. 16) applied by him to the Nervii, a tribe which despised the rest of the Belgians for their submission to the Roman dominion. And if it were just, there is no difficulty in supposing a relaxation of the laws against foreign traders after Caesar's time. The fault of this supposition, however, is that it does not fall in with M. Schuermans' notion of the high antiquity of the articles about which he writes. In the second place, the passage of Livy (v. 33) refers to the supremacy of the Etruscans by sea and land up to their decisive defeat by Hiero I. of Syracuse, B.C. 474, and has nothing to do with the spread of their wares north of the Alps, while the passage of Pliny (xxxiv. 16) concerning the *signa tuscanica* to be met with in various lands applies to statues, not to utensils, and moreover need not be taken as referring to so very early a period, or as including Belgium in the "various lands." In the third place, the fact that in Greece solder was in use instead of rivetting in bronze work as early as the fifth century B.C. cannot be relied on to prove that the bronze cista (No. 2), in which rivets have been employed instead of

solder, was made previous to the fifth century B.C. For the artists of Etruria, and more especially the workmen, we should suppose, took very few hints from the Greeks, even in later times of greater commerce. But after all, there are many who give good reasons for believing that the objects looking like Etruscan found of late years in great numbers north of the Alps—notably at Hallstatt, in 1868—and also conspicuous for the absence of solder in the bronze work, are really ancient productions of the native workmen of the countries where they are found, owing their resemblance to objects found in Etruria, both in manner of manufacture and style of decoration, to a common inheritance of skill and taste which the southern nations developed more quickly. In that case we should be still less surprised if a Greek invention of the sixth century B.C. did not reach the native workmen in distant parts of Europe till after Caesar's time.

**Excavations at Mzohet.**—If Fr. Bayne has hit upon the right way of accounting for the uniform presence of not less than three skeletons in one sarcophagus in the ancient tombs of Mzohet, near Tiflis, he will have contributed a valuable commentary to the statement of the geographer Strabo concerning the practice of sacrificing human beings which existed among the natives of that district in his time. In any case, the report on the excavations among these tombs, the first instalment of which is given in the *Zeitschrift für Ethnologie*, part iii. 168, will prove an important addition to our knowledge of the condition of ancient civilisation in that quarter. Distinguishing the sarcophagi of the native Iberians from those of the Greek residents, he describes the former as of two classes in point of size, the smaller containing always three skeletons, the larger more than four, usually six, skeletons. The rule with regard to the smaller sarcophagi is to find them containing one grown person decked with ornaments of gold and pearls, and accompanied by two children with ornaments of bronze of a rude pattern. In cases where the two companion skeletons are of larger make, the ornaments are still of this common material and pattern. In the larger sarcophagi, on the other hand, there is a marked absence of ornaments throughout, from which Bayne concludes that the tenants must have been ordinary victims sacrificed to the gods, while with respect to the triple occupation of the lesser sarcophagi, he considers that the two secondary persons—generally children—had been sacrificed in token of grief at the decease of the central and conspicuous person. The most appalling result of his researches is that the victims appear to have been buried alive. The sarcophagi which he ascribes to the Greek residents contain only one skeleton, beside which, in one instance, he found a bronze mirror, such as the tombs of Kertsch usually yield, and an engraved onyx with a Greek name inscribed on it.

**The Engis Caves.**—These caves, where Schmerling carried on such successful explorations, have been further examined by E. Dupont, who has laid his report before the Académie royale des Sciences de Belgique (*Bulletin*, No. 6). He found a human ulna, and bones of *Ursus spelaeus*, *Rhinoceros*, *Sus scrofa*, *Equus caballus*, *Cervus tarandus*, *Cervus elaphus*, and *Bos primigenius*. A great number of flint implements were also met with of a form resembling those from the caverns of Sureau and Magritte; drawings are given of some from the second cave in which Schmerling found the human skull.

### Chemistry.

**The Origin of the Urea of the Animal Body.**—Schultzen showed some time since that certain nitrogenised substances, containing but one atom of the element, are converted in the animal body into urea, and suggested that the final oxidation-products of the amidated acids, of leucine, glycocine, &c., may be either bodies of the cyanogen group or carbamic acid. If animals yielding a uniform amount of urea be given glycocine or leucine, they secrete an increased amount of urea exactly corresponding to the nitrogen of the leucine or glycocine supplied to them. The objection could of course be raised that the increase of urea arose from the substance introduced acting like a fever-poison. Though no symptoms of fever were observed, to meet this difficulty, a substitution-glycocine was chosen for the experiment, methyl-glycocine or sarcosine being preferred. According to a recent paper (*Ber. Deut. Chem. Gesell. Berlin*, No. 12, 578), if a well-nourished dog be given, in addition to his ordinary food, the amount of sarcosine the nitrogen of which corresponds to that of the urea daily secreted, urea and uric acid disappear altogether from the urine, and are replaced by a series of new and definitely characterized bodies, the examination of which cannot fail to explain as yet unknown normal processes of interchange of matter in the animal organism. One of the substances is obtained by the author's method as the acid of a baryta salt; the other, which forms brilliant tabular crystals, has the formula  $C_4H_5N_2O_3$ ; when heated with baryta solution in closed tubes, it splits up into carbonic acid, ammonia, and sarcosine:

Its rational formula therefore is clearly

and it may be regarded as a urea the two atoms of hydrogen of one atom of nitrogen of which have been respectively replaced by methyl and acetic acid, or as a sarcosine in which the group  $N(CH_3)H$  has the H replaced by the group  $NH_2CO$  of carbamic acid,  $NH_2COOH$ . The author traces the formation of the new body to the combination of sarcosine and carbamic acid with separation of water. The acid body combined with baryta was found by analysis and a study of its behaviour when heated with baryta to have the composition

that is, of a compound of sulphamic acid with sarcosine minus water. Here then is the sulphamic acid of the bodies, albuminous and gelatinous, which the sarcosine has met, and which under normal conditions is transformed into sulphuric acid and ammonia, the latter combining with carbamic acid to form urea. It is a point of no little interest to know the form in which the sulphur is contained in the complex bodies of these two classes. Under normal conditions fowls convert the greater part of the nitrogen of their food into urate of ammonia; when plentifully supplied with sarcosine, however, they fail to secrete any uric acid, and produce new and definite substances, the characters of which are now under investigation. The details of this interesting research are to appear in the *Annalen der Chemie*.

**Analysis of a Bronze Celt.**—The implement in question, one of many found at Salzberg, near Halstatt, has been examined by E. Priwoznik, of the Vienna Mint (*Annalen der Chemie*, clxiii. part 3, 371). It was remarkable for having a crust of a reniform or botryoidal structure, and an indigo-blue colour; being from 5 to 7 mm. in thickness, diminishing near the edge to 2 mm., and weighing nearly 100 grammes. On the inner side the crust was in some places coated with a thin layer of bright green basic carbonate of copper. The first or outer, and in fact the chief, layer is very brittle, and has a fracture which, when fresh, exhibits an imperfect metallic lustre and a distinctly radiate structure; the streak is very deep blue, almost black. It is composed of 33.22 per cent. of sulphur, and 66.77 per cent. of copper, being in fact covellite ( $CuS$ ), to which mineral it likewise bears the fullest resemblance as regards specific gravity and other physical characters. The second layer, found only in certain portions of the crust, is separated from the first layer with difficulty; it has a blackish-grey colour, is about 0.5 mm. thick, and consists of copper-glance ( $Cu_2S$ ), through which is disseminated about 15 per cent. of tin. This metal, it will be remarked, is not present in the outer layer. The third layer, sparsely distributed, consists of a black powder composed of 59.8 per cent. of copper-glance, 23.2 per cent. of tin, 3.4 of water, with traces of antimony and nickel. The unchanged bronze of the Halstatt weapons was shown by v. Schrötter to have the composition: copper, 90–92 per cent.; tin, 6.5–9.0 per cent., and traces of six other metals, which traces have been detected in the several parts of the crust. It follows then that this crust is due to a direct chemical change of the bronze, and not to deposition from without. The tin and the other metals appear to have moved from without inwards as the alloy became broken up on the conversion of the copper into sulphide by soluble sulphides or gases containing sulphuretted hydrogen. The author has succeeded in covering fragments of antique bronzes with a layer of blue copper sulphide by long treatment with yellow ammonium sulphide. The presence of zinc as a constituent appears to prevent copper alloys from undergoing this change. Knop ascribed the formation of covellite to the decomposition of copper pyrites, by oxygen and water containing carbonates, into carbonate of iron and copper-glance, and the production of covellite and copper oxide from the copper-glance by the continued action of those reagents. The author's view of the formation of this mineral has the advantages of being less intricate, and of deriving support from direct experiment.

**Conversion of Aniline into Toluidine.**—This has been accomplished by A. W. Hofmann (*Ber. Deut. Chem. Gesell. Berlin*, 13th August, 720) in the following manner:—By heating one molecule of aniline hydrochlorate with one molecule of methylic alcohol for many hours at 230° to 250°, there is formed a yellow transparent resinous mass of the consistency of honey, consisting for the most part of methylaniline hydrochlorate:

If the tube be now heated for a day to 350°, it undergoes a complete change. The transparent viscous fluid is converted into a beautifully crystalline mass, the secondary salt is transformed into the primary:

The solid mass is almost completely soluble in water, and by treatment with alkali liberates the base as a brown oil, which, when distilled in an atmosphere of steam, solidifies in the receiver into a brilliant white mass of toluidine, the melting-point of which is 45°. In this reaction but few by-products are formed. Aniline hydriodate furnishes a liquid toluidine. The author intends to attempt the formation in a similar way of homologues of the amines of other classes, and of some of the

bases occurring in the organisms of plants. One of the by-products of the action of heat on trimethylated phenylammonium iodide is a beautifully crystallised hydrocarbon melting at  $136^{\circ}$ , and boiling between  $230^{\circ}$  and  $240^{\circ}$ . It gave the formula  $C_{12}H_{10} = C_6(CH_3)_3$ , and is supposed by the author to be benzol, the whole of the six atoms of hydrogen of which have been replaced by methyl. If it be so, he considers that the oxidation of such a compound will yield products worth investigation.

**Fall of Aërolites in France.**—The *Compt. rendus* of the 29th July contains a note from M. de Tastes, addressed to the Academy of Sciences, and presented by M. Sainte-Claire Deville, describing the fall of an aërolite in the neighbourhood of Lancé, in the canton of Saint-Amand, Loir-et-Cher. At 5<sup>h</sup> 20<sup>m</sup>, Tours mean time, on the 23rd July a brilliant meteor passed over a spectator stationed between Champigny and Brisy towards the north-east in the direction of Tours. It presented the appearance of a spear of flame with two spheres of fire of an orange colour; the track of one seemed to incline downwards, that of the other to proceed straight forward, the whole appearance becoming somewhat more luminous at the instant a slight divergence of the course of these two spheres was first seen. It was lost to sight behind a cloud near Sainte-Maure, and an explosion was heard at 5<sup>h</sup> 26<sup>m</sup>. Many observers affirm that they heard two distinct explosions very near together, others noticed but one; all testify to the appearance of two meteors pursuing nearly the same path. A meteorite fell in a field near Lancé, and passed a metre and a half through the light soil into a bed of marl. It weighs 47 kilogrammes; some fragments separated by the fall were found near it.—In the last number of the *Compt. rendus*, for the 5th August, is a note by M. Daubrée recording the more recent discovery of a second meteorite at Pont-Loisel, 12 kilometres south-east of Lancé. The line joining the two localities coincides with the direction of the trajectory of the meteors, and the Pont-Loisel stone, though much smaller (it weighs 250 grammes), bears the closest resemblance as regards mineral characters to the Lancé stone. The smaller stone fell first—a circumstance observed in former showers—and penetrated the soil to a depth of only half a metre.

**Conversion of Tartaric into Racemic Acid.**—M. Jungfleisch announced at a meeting of the *Société chimique* held last month that tartaric acid may be almost completely transformed into racemic acid by heating it in a closed vessel at  $172^{\circ}$  to  $175^{\circ}$  for a dozen hours (*Revue scientifique*, 28th July, 68). He exhibited several hundred grammes of racemic acid prepared by this method, and established its identity by a careful examination of the racemates.

Writing from Florence to a recent number of the *Ber. Deut. Chem. Gesell. zu Berlin*, H. Schiff reports the progress made since 1867, in the publication at Turin, of the *Enciclopedia chimica*, edited by T. Selmi, of Bologna. This great work is arranged very much after the form of the first edition of the *Handwörterbuch* of Liebig, Wöhler, and Kopp, and five quarto volumes of it have already appeared, embracing about 1000 pages and bringing it down to the letter F. The articles on theoretical and organic chemistry are by Schiff, Sestini, Paternò and others, those on technical chemistry by Arnaudon, of Turin; many are said to exhibit a completeness hardly met with in German works of the kind. Some indication of the degree in which the *Enciclopedia* is appreciated in Italy is shown by its boasting over 2000 subscribers.

The directorship of the new laboratory at Rome has been offered to Dr. Hugo Schiff, who will however remain at the Florentine Institute, which has been even more richly endowed by the Italian parliament than the institution at Rome, the charge of which has been undertaken by Prof. Cannizzaro.

### History.

**Contributions to the History of the Literature of the Times of Thököly and Rákóczi, 1670–1735.** By M. Koloman Thaly. [*Adalékok a Thököly-és Rákóczi-kor irodalomtörténetéhez.*] Pest: Ráth.

THESE two volumes refer to that interesting portion of Hungarian history known as the *kurucz világ*—an expression which we may perhaps be allowed to translate by “insurgent world.” The word *kurucz* is derived from the Latin *crux*, and the name was first applied to the peasants who in 1514 were collected by the pope's legate for a crusade against the Turks, but turned their arms against the nobles. This name was assumed by the insurgents, mostly peasants or members of the lowest sections of the nobility, and almost exclusively Calvinists, who in 1672 rose against the intolerable fiscal oppression and religious persecution practised by the lieutenants of the emperor Leopold I. The assumption of the name *kurucz* pointed to an essential distinction between this insurrection and the political wars of religion that had filled the earlier part of the seventeenth century. In these earlier wars the political classes had taken the initiative, and reasons of statecraft and the interests of the princes of Transylvania had limited the extent and duration of the warlike operations. On the other hand, the insurrection of 1672 was—at any rate in its beginning—a popular movement, excited by oppressions affecting the lower classes of society. Hence the revival of the word *kurucz* of demagogic memory. With varying fortunes, and under diverse leaders, the insurrection continued until it culminated in the expulsion of the Germans out of the whole of Upper Hungary by Thököly. He was recognised by the sultan as vassal king of Upper Hungary, and the vezier in 1683 proceeded to lay siege to Vienna. The defeat of the Turks by Sobieski and Charles of Lorraine (*tringiai Károly*) involved the ruin of Thököly. In vain did his heroic wife, Zrinyi Ilona, defend the rock of Munkács for more than twelve months. The Turks were slowly but steadily driven out of Hungary. Transylvania submitted to the rule of the house of Habsburg. Thököly was interned, a helpless exile, in Asia. A series of victories had laid Hungary at the feet of Leopold the “Great.” Not only the fear they inspired silenced opposition, but a large part of the nation felt that the expulsion of the Turks was a benefit so great as to counterbalance many evil deeds on the part of the German government. Under such circumstances it was natural that the old oppressions should be repeated by the foreign—German and Italian—agents of Leopold, to end in the same result. In 1703 a second *kurucz* insurrection broke out in the same part of the country as the first—along the banks of the upper Tisza. Prince Francis Rákóczi II., son of Zrinyi Ilona by her first husband, was placed at its head. The expulsion of the Turks from Hungary, which at first seemed to render the prospects of the insurrection doubtful, really enabled it to assume more formidable dimensions, as it spread over the whole country from the north-eastern

Carpathians to the frontiers of Styria and the banks of the Drave. So strictly *kurucz* was it in its origin that the first officers of the insurgent's army were swineherds, barbers, tailors, &c., elected by the peasants themselves. Nor was it until he had achieved several successes that Rákóczi received the adhesion of the nobles, who but gradually and a few at a time joined his standard. After many successes and reverses, the exhaustion of the country, the wiser and more conciliatory spirit of Leopold's sons, and the success of the allies against Louis XIV., Rákóczi's ally, put an end to the insurrection in 1711. One of Rákóczi's lieutenants, Alexander Károlyi, a man of great ability and prudence, negotiated for the insurgents the Peace of Szatmár, which closed the long period of internal wars which had wasted Hungary with but slight intermissions for more than a century and a half. The character of the warfare then waged is incidentally revealed by such words in the Hungarian language as *hajdu*, *katona*, *szegény legény*, which have fluctuated between the meanings of "soldier" and "robber," and it is repeatedly alluded to in the present collection, especially in the *labancz* or anti-*kurucz* pieces. The leading spirits of the insurrection, Rákóczi and Bercsényi, however, refused to recognise the treaty, and betook themselves to the hospitality of foreign sovereigns, the Czar of Muscovy, the King of France, the Sultan of Turkey. In 1735 Rákóczi died in exile at Rodosto, on the shores of the Sea of Marmara, leaving behind him a name which, in spite of his want of ultimate success, or perhaps on account of it, has enjoyed a larger measure of posthumous fame than any other in Hungarian history.

Such is the period which the lamented historian, M. Szalay, himself spoke of as the most interesting and instructive in the history of his country, but death put an end to his labours before he had completed his account of the times of Rákóczi. In its investigation and illustration M. Thaly, mindful, as he tells us, of the maxim, "*ars longa, vita brevis*," has already spent the spare moments of twelve years. During this time he has examined nearly a hundred and fifty public, family, and private archives. The results of his researches have appeared in his *Life of Blind Bottyán*, one of Rákóczi's generals, and several other historical works relating to the "*kurucz* world." While carrying on these investigations, he kept in view not only what is still considered by many in its narrowest sense history, the record of wars, battles, negotiations, administrative measures, &c., but also the literature of the times, revealing more or less clearly the degree of culture attained by the nation or individuals, the passions and the beliefs which sustained them during the long internecine struggle. The result is the two volumes before us, the first containing the poetry illustrative of the insurrection of 1672 and the career of Thököly, the second that illustrative of the insurrection of Rákóczi.

As long ago as 1864 M. Thaly had conceived the plan of this present work. In the preface to his collection, entitled *Old Hungarian War-songs and Elegies*, published in that year, he stated that the pieces of a later date than 1670 had been reserved with the view of publishing all relating to the "*kurucz* world" in a separate collection. In like manner he has excluded from the present work all pieces of a later date than 1735, the year of Rákóczi's death. At present, to judge from his preface, he does not see his way to publishing a collection of them. In 1864 he had collected about sixty or seventy *kurucz* poems, but he deferred their publication from two motives. Not only did he entertain hopes—now happily fulfilled—of rendering the collection more complete, but the police regulations relating to the press—M. Schmerling being then in the height of his power

—would have rendered the publication of such "rebellious" literature difficult, not to say impossible. Since 1864 the collection has been augmented not only from MS. in public and private archives, but also by an extensive correspondence with and personal enquiries from all sorts of persons who might be supposed to have any knowledge of the subject—descendants of *kurucz* leaders, surviving members of old bands of gipsy musicians, and the like. In Hungary, as elsewhere in Europe, the conviction prevails that the old world is definitively passing away, that now, if ever, must be collected the wrecks of tradition which have withstood the assaults of time, but are fast disappearing before the railroad and the common school. Not the least interesting or instructive reading in the two volumes before us is afforded by the history given of each piece, its preservation, and its discovery. M. Thaly writes on this subject with a genuine enthusiasm which perforce communicates itself to the reader. As the most striking instance in point, we would refer to the account given (ii. pp. 227–241) of the scarcely suspected survival of the original music of the *Rákóczi-nóta* down to the present day.

The collection itself is sufficiently miscellaneous. With the exception of two dialogues out of the *Actio Curiosa* (noticed in the *Academy*, vol. ii. p. 473), sixteen unpublished letters of the poet Gyöngyösi, a Latin cento on the Diet of Szécsény, and two Latin hymns, all the pieces are in verse and in the Hungarian language. Most of these Hungarian poems express the sentiments of the *Kuruczok*, a few those of the *Labanczok*, or partisans of the Habsburgs. The larger number, including those of the greatest value as historical documents, are popular poems composed by uneducated or half educated men, but the collection also includes poetry written by persons of culture, illustrating not merely the struggle but also the ideas then entertained about literature. We have a good number of the unflinching loyalist Count Koháry's long-drawn effusions, lamenting his undeserved misfortunes—he was for three years a prisoner in the hands of Thököly—in a monotonous strain of somewhat provoking self-complacency. By way of contrast we have one specimen given us of the unpublished poems of Petröczy Kata-Szidonia, the wife of the *kurucz* leader, the last Count Pekry. It is marked by pathos and "distinction," but the versification has that monotonous character so general in the Hungarian verse of the seventeenth century. The most important from a literary point of view is an abridged version of a hitherto unpublished poem, 499 stanzas in length, on the marriage of Thököly and Zrinyi Ilona. It has neither title nor name of author, but is evidently written by a contemporary imitator of Gyöngyösi. The latter poet, be it observed, was a steady adherent of the *labancz* cause. The foot-notes elucidating the allusions in the text are very useful, but occasionally there ought to be more of them. The spirited piece in the second volume (pp. 121–128) which describes the state of Kolozsvár when besieged by the *kurucz* army is composed in a style so terse as to be often obscure. And surely there must be many Magyar readers who will not understand the strange jargon of the Slovak insurgent in vol. ii. p. 376. The two volumes form a valuable addition to our knowledge of the period, and mark a long step towards the composition of a regular history of the *kurucz világ* which M. Thaly half promises us.

ARTHUR J. PATTERSON.

*Heimskringla*, eller Norges Konge-sagaer, af Snorri Sturlasson. Udg. ved C. R. Unger. Christiania: 1868.

THE *Heimskringla*, or *Lives of the Kings*, written by the old Icelandic historians, exist in miscellaneous collections of

sagas, and in various redactions. Chronologically they fall under two heads, the *mythical* and the *historical*; and among the historical we may again discern between the "epic historical," written from oral tradition, treating events from bygone times, and the historical in the modern sense, or those written and recorded by contemporary writers.

The mythical period ends, and the dawn of history begins, shortly before the time of the settlement of Iceland, about the time of King Harold Fairhair and his father Halfdan the Black. Whatever is recorded to have happened before that time falls within the mythical age, extending from Odin downwards to the middle of the ninth century. The two centuries next following make up what may be called the Saga age, the time of the early historic sagas, marked by two great events—the settlement of Iceland, the Orkneys, the Faroes, and a century later by the introduction of Christianity. Then comes the purely historical time, when events and writing run parallel.

*The Lives of the Kings* may be divided thus. The mythical age is comprehended in the brief *Ynglinga Saga*, containing a pedigree of kings from Odin, accompanied by brief notes on each king, his death, his cairn, intermingled with various interesting mythical anecdotes. The historical series of kings then begins with King Harold Fairhair and his father Halfdan the Black. In the ancient works and MSS. we may divide this series into three parts: (1) *The Life of King Harold*, the ancestor of all future Norse kings, with the lives of his sons and nearest successors, kings and earls, within the heathen age, including the end of the ninth and the whole of the tenth century; these sagas only exist in an abbreviated form. (2) Then follow the *Lives of the two Olaves* (*Olafanna Sögur*), King Olave Tryggvason and St. Olave, *Olafs-Saga-Tryggvasonar* (995–1000) and *Olafs-Saga-Helga* (1014–1030). These two kings were the champions of the Christian faith, much celebrated in song and story, and of each there exists accordingly an elaborate historical account. (3) Lives of the following kings: Magnus the Good and Harold Hardrada, and his successors down to King Sverri, including about 150 years (1030–1180); King Harold is the last in the list whose life still bears the mark of the epic and early saga style, although his time borders close on the age of writing, for the first Icelandic historian, Ari (see *Academy*, vol. i. p. 272), was born only a year after his death, and this historian, Ari, was the very man who, among other works, laid the foundation of the *Lives of the kings of Norway*, in a work variously called *Konunga Æfi*, *Konunga-bók*, or *Konunga Sögur*. Among the kings of the twelfth century there was no eminent man, and their sagas are accordingly devoid of much interest until the appearance of King Sverri, 1177–1202, of whom there exists a separate saga, a highly interesting and well written history (*Sverris Saga*); the saga of his grandson, King Hakon († 1263); his son was King Magnus the Law-minder († 1281), whose life (now lost, with the exception of a fragment) is the last saga written by an Icelandic sagaman on a Norse king. Thus counting from Harold Fairhair, we have an unbroken series of above 400 years, a period almost exactly coinciding with the existence of the Icelandic commonwealth.

Now, as to the work commonly called *Heimskringla* (the name is modern, taken from the beginning words "Kringla heimsins," the *Circle of the world*); this work contains a recension of the *Lives of the kings of Norway* down to King Sverri; first comes a preface, including a brief record of Ari, the historian, whose book formed the groundwork; then the series of the sagas themselves, beginning with the *Ynglinga Saga*, the *Heimskringla* being the only recension that has preserved that saga to us; for all the other recensions begin with King Harold Fairhair (the *Fagrskinna*,

with his father Halfdan the Black). The *Lives of King Harold* and the next following kings, King Hakon (the foster-son of King Athelstan), and the sons of Gunhild, are here given in a fuller and better form than elsewhere. It is succeeded by the saga of Olave Tryggvason, much abbreviated in shape as compared with the large *Olafs Saga* contained in the Arna-Magn. vellum, folio 61, and published in *Fornmanna Sögur I.–III.*, as also in *Flateyrbók*; yet the abridgment is done with a careful hand, evidently by a historian, not, as is the case in some of the following, by a mere abridging, unskilled transcriber. The *Olafs Saga Helga* (St. Olave) conforms in the main to the special saga of that king, published in *Fornmanna Sögur IV. and V.*, but especially it agrees closely with the text in the edition of 1853 from an old Icelandic vellum in Stockholm. The sagas of the following kings are given in an abridged text, and mostly by an unskilful hand, especially in the sagas of the kings of the twelfth century; and we may add that the texts of the various MSS. of *Heimskringla* vary here among themselves, transposing, adding, and omitting, so as to produce an almost hopeless confusion. The best and fullest text of all these sagas from Harold Hardrada downwards to Sverri, is contained in another ancient Icelandic vellum called *Hulda* (Arna-Magn. folio 66), and published in the sixth and seventh volume of the *Fornmanna Sögur*. The *Heimskringla* ends abruptly in the year 1176; but only in a single MS., the parent of our vulgate text; for the other vellums run on, and also give an abridgment of the *Sverris Saga*, as well as of the *Hakonar Saga*, down to 1263, some comprehending but one, some both those sagas.

The author of this work is in the editions and in all later writings said to be Snorri Sturlason, born 1178, died 1241, the famous writer of the *Edda*; but curiously enough, neither the MSS. nor the tradition attest this; the only vellum that says anything about the matter is the *Cod. Fris.*, which begins thus: "here beginneth the Book of Kings according to the records of Ari, priest, the Historian." The first mention of Snorri, as compiler of the *Heimskringla*, occurs in a Danish (or Norse) translation of it by a certain Lauriz Hansson of 1550 (Arna-Magn. 93, and autograph); he says: "as it is recorded in the preface of Snorri Sturlis (*sic*), the Norse historiographer;" and "here endeth the preface of Snorri Sturlesenn in the Book of Kings." This statement was repeated in a later translation by the Norwegian priest Clausen (1599), whose translation was published by Ole Worm (a Dane) in 1630. The most learned Icelandic scholar of that time, Arngrim the Learned, was himself unaware of the fact, for in a letter to Ole Worm of 1632 (Aug. 18), he says: "quod ad Snorronem nostrum, an vestrum potius, quibus lucem et se ipsum profundâ oblivionis nocte debeat;" "as to our Snorri, or rather your Snorri, for to you (the Danes, not to us Icelanders) he owes both the light and the deliverance of himself out of a deep night of forgetfulness." The fact appears nevertheless to be substantially true. If not the *Heimskringla* in its present shape, yet the *Life of St. Olave*, as it stands in the edition of 1853, is the work of Snorri; his authority is once quoted in regard to the battle of Swolder (where Olave Tryggvason fell), and the reference quoted agrees with the text in our *Heimskringla*. Graver doubts may exist as to his authorship of the last part, namely, the sagas of Harold Hardrada and the rest; if he ever was the composer of those sagas, his work would be more likely to be the text of the *Hulda* (our best text), and not the badly compiled abridgment which is given in our texts of the *Heimskringla*.

But Snorri was not the original compiler of these records; neither could he have been, for at his time the tradition of events that had happened in the tenth century had greatly,

if not altogether, faded away in Iceland. But there were other sources :—

I. The *Book of Kings*, or *Lives of Kings*, by Ari, a book which appears to have existed as a separate work, but was at a later time inserted (abridged ?) into his *Islendinga Bók* (see *Academy*, l. c.) ; this Book of Kings is lost, but we can often penetrate to it and perceive it through the veil of the works of later historians ; in the chronology, and chiefly in the choice records as to heathen rites, sacrifices, customs, and manners ; in the genealogies, which we owe to Ari's authority ; &c.

II. The next sources were the old poems (war-songs), but however rich in words and circumlocution, they were but poor in facts.

III. The large collection of episodes and sagas of Icelanders who had lived in Norway in the times of the respective kings, received honours there, and now that they returned, the incidents of their lives were handed down shaped into a little tale ; those episodes the Icelanders call "thættir" (twists of rope), distinguishing them from the longer sagas ; they were told and re-told at festivals, meetings, banquets, weddings, at the evening winter-hearth, and at length written down. A large collection of such episodes, rich and varied in scenes and characters, is embodied into the Sagas of the Kings (thirty, forty, or upwards), and forming sometimes the choicest part of the narrative. The saga of Harold Hardrada, e.g. and that of Olave Tryggvason, are for a great part made up of these small stories, which inform us, not of the king's public life and career, nor even of his dealings with his subjects in Norway, but of his audiences and intercourse with the Icelandic visitors in Norway (e.g. the *Tale of Stuf the Blind* in the saga of King Harold).

IV. As to the *Lives of the Kings* next preceding Sverri, there was a work written by an Icclander, Erik Oddson ; that book was called *Hryggjar-Stykke*, a record, mostly authentic, of the events in Norway immediately after 1130 ; this work is lost, but it is the groundwork of the complete saga as found in the *Hulda* and in the *Morkinskinna*.

Most of the ancient vellum MSS. of the *Heimskringla* were preserved in the old University Library at Copenhagen, and were consequently all destroyed, together with the library, in the great fire of 1728. These vellums were :—

1. The *Kringla* (also called *Cod. Acad. Primus*). This famous vellum is the foundation for all the editions (with one exception), and it has given the name to the book itself. It was nearly a complete copy, only the first leaf with the preface was wanting, and the corresponding leaf, the eighth and last in the quire ; it therefore began with the first chapter of the *Ynglinga Saga*, where the words "Kringla" or "Kringla heimsins," from which the name is derived, occur in the first sentence. This vellum seems to have been written in the year 1266. 2. The next vellum was by Torfaeus called *Jöfraskinna* (*Membrana Regum*), also called *Cod. Acad. Secundus* ; it did not end as the former MS., but ran on into *Sverris Saga*, the end being wanting. 3. The third was by Torfaeus called *Gullinskinna* (*Golden-skin*), *Membrana Aurea*, from the brilliancy of its writing and parchment ; it only contained the latter part, beginning with the life of King Olave the Quiet (1067–1093), and ran on through *Sverris Saga* and *Hákonar Saga*, where it ended, being defective. Although these vellums were destroyed, they have been preserved in a transcript by the well-known vellum-transcriber, Asgeir Jónsson. The learned Icelandic historian Thormod Torfaeus was at the end of the seventeenth century engaged by the king of Denmark to compile the *Historia Norwagiae*, the *Series Regum Daniæ*, the *Winlandia*, the *Orcades*, &c., until

in consequence of an unlucky accident (a manslaughter), for which see *Hist. Eccl. Isl.* iii. 570, 571, Torfaeus fell into disgrace with the king, who exiled him to Norway, to the island Karmten, in Bergen-Stift ; here he lived during the remainder of his long life for about fifty years, far off from the vellums in Copenhagen. He therefore had all these vellums copied by Asgeir, the Icelandic vellums of the Royal Library as well as those of the University Library ; the Arna-Magn. Library did not yet exist. Among other things all the vellums of the *Heimskringla* were copied, precious fragments of the *Orkneyinga Saga*, and much besides ; and a happy accident it proved to be, for when in 1728 the library with the originals was consumed by fire, these accurate transcripts were preserved, all in the possession of Árni Magnússon, who had bought them at the death of Torfaeus in 1719. The transcript of the *Kringla* is contained in three volumes (Arna-Magn. 35, 36, and 63), and that of the *Jöfraskinna* in Arna-Magn. folio 37. The first edition of the work, published in Sweden in 1697, before the fire, is founded throughout on the *Kringla*, but not so the folio edition of 1777–1783 and its later reprints, of which the third part is founded not only on a different MS. but even on a different recension ; and for this reason :—In making the catalogue of the Arna-Magnæan MSS. (in 1731), the third and last volume of Asgeir's transcript had by inadvertency been separated from the rest, and placed under No. 63. This circumstance was unknown to the editor, and it was noticed by the present writer when ten years ago the collection was removed from its old place in the Round Tower into the New Library building at Copenhagen. The present edition is throughout founded on the same MSS. (Arna-Magn. 34, 35, 63), and is consequently the first real true edition of the work presenting oneness in the text.

The present edition originated thus. It was originally intended to be edited by the late Prof. P. A. Munch ; but at his lamented decease in 1863, the work, which seems not even to have been begun, was transferred to the present editor. It is a commendable work in every respect, especially in the philological parts, in which the editor has endeavoured to give the chief peculiarities of the spelling of the *Kringla* : e.g. the double use of the *ö* (*q* and *ø*), answering to the double sound of that vowel. The transcripts of Asgeir are accurate in the text and meaning, but seldom in spelling ; but some few pieces exist in Árni Magnússon's own handwriting, and he was the most accurate man both in text and in spelling. We may here add a fact which has escaped Prof. Unger, viz. that besides those pieces which Prof. Unger has given in the preface as existing in Árni's hand, there also exists a fuller evidence as to the spelling of this old vellum. The *Kringla* wound up with a "List of Poets" (*Skálda-tal*), following the series of the kings, and adding in parallel columns the names of those poets (skalds) who composed songs on each of the kings ; this last part of the *Kringla* is preserved in a separate transcript executed by Árni himself (Arna-Magn. No. 761, qto.), and is printed (but not yet published) in the third volume of the Arna-Magn. edition of the *Edda*, pp. 251–269, following letter for letter the spelling of the old vellum. By the aid of this List we are also enabled to fix the age of the MSS. ; for it has the name of King Hakon, with Sturla the Lawman as his poet ; this poem was composed in 1264 or in 1265, shortly after the king's death. The List, on the other hand, omits the name of King Magnús, his son, on whom the same poet composed many songs, for which he received honours, as stated in *Sturlunga Saga*, iii. 306.

Prof. Unger's preface gives a good account of older editions, especially that of Peringsköld, and of the way in which

modern pieces and additions from other sagas have crept into the text. All this is now weeded out, and the book is a handsome edition; at the end there are indices of names—of proper names and of local names—all done in a satisfactory and unpretentious way. GUDBRAND VIGFÚSSON.

#### DRACO NORMANNICUS.

I AM not aware whether the periodicals have at all noticed the recent rediscovery of a document by no means unimportant for the medieval history of England, but appearing to have been lost for a number of years.

Montfaucon (*Bibliotheca Bibliothecarum Manuscriptorum nova*, i. 41, 1739) was the first who mentioned as the contents of MS. Reg. Christ. 1267: "Anonymi *Draco Normannicus*, versus continent historiam Mathildis Imperatoris Francorum Anglorum et Normannorum, quaedam ibi habentur de synodis sub Victore et Alexandro III." Afterwards J. J. Brial, well acquainted with this notice, printed from a volume of abstracts of MSS. belonging to the queen of Sweden, which he found in the library of St.-Germain-dès-Près, part of the introduction in verse, as well as the prose headings to the several books and chapters of the work, in *Notices et Extraits des Manuscrits de la Bibliothèque du Roi*, viii. 2, 297, 1810. He asserted at the time that, when he enquired for the MS. in the Vatican through the academicians, M. La Porte du Theil, and Cardinal Dugnani, late papal nuncio in France, the book was not to be found. Brial is of opinion that Stephen of Rouen, a monk of the abbey of Bec in the twelfth century, was probably the author of *Draco Normannicus*, a poet of whom verses in a similar style are preserved in a MS. of St.-Germain, and about whom there is an article in the *Histoire littéraire de France*, xii. 675. Brial's extracts and conjectures concerning the authorship are repeated by Sir Thomas Duffus Hardy, *Descriptive Catalogue of Materials relating to the History of Great Britain and Ireland*, ii. 297, 1865.\* It appears that the MS. was not forthcoming when the late Record Commission sent emissaries to the continental libraries, though I happen to know that Dr. Pertz much about the same time obtained a copy with the purpose of printing it in the *Monumenta Historiae Germanicae*. At length it turns up again in print, and at a place where not every sharp-sighted enquirer would readily look for it, viz. in *Appendix ad Opera edita ab Angelo Maio S. R. E. Presbytero Cardinali continens quaedam Scriptorum veterum Poetica, Historica, Philologica ex codicibus collecta*. Romae apud Josephum Spithoever M.DCCC.LXXI. 4°. As the editor, Joseph Cozza, Monachus Basilianus, is altogether silent about the long disappearance of the volume, one can only guess that Cardinal Mai, who died in 1854, kept it a good long time by himself. And nobody thought of it until sixteen years after his death it is published, together with some other of his transcripts, in the same slovenly manner by which the learned men of the Vatican have latterly distinguished themselves. In a few scanty words, not altogether free from suspicion (p. 20), the reader is informed that the poem after all did not belong to the collection of Queen Christina, but that, after some vicissitudes, it is preserved in an Ottobonian MS., viz. Vat. 3081. Moreover, it turns out to be a paper copy, and consequently neither very old nor the original of an author of the twelfth century. There is, however, a notice at the end (p. 65 of the edition), saying, "Libellum istum sumpsit ex quodam *perno*" (= *parvo*, says the editor) "*antiquo* libro, quem mihi concessit R. M. R. B. Et erat ille liber ut credo de Ab. de B. H." (Bec-Hellouin?). Not a word is added about the age of the handwriting or the paper. The work contains in print 4346 verses, exclusive of three gaps after v. 1439, v. 1629, and v. 3007, in each of which places a leaf equal to a hundred verses has been torn away. The editor, who has added a few flimsy notes mixed up with the glosses which are written on the margin of the MS., is also to be blamed for having suppressed the opening of the Prooemium under the pretence: "quia nihil historicum, nihil non vulgare habebat" (p. 21). He consequently begins with the same words as Brial's extracts: "Dum moror in studiis," &c. Lastly, he has arbitrarily distributed the prose

headings or titles, which in the MS. stand by themselves over the whole poem, inserting them wherever he thought fit.

In spite, however, of the late date of the MS. and the bad editorship, a careful perusal must convince every scholar that he has not to deal with a supposititious forgery, but unquestionably with a composition of the twelfth century. Though distichs were not frequently selected for an historical poem, the imitation of Ovid is not altogether unusual in medieval historiography. I may refer to Ermoldus Nigellus and his contemporary work: *In honorem Hludowici Christianissimi Caesaris Augusti* (Louis le Débonnaire), printed in Pertz, *Scriptores*, ii. 467; and in every respect much nearer the Norman poet, to the *Carmen de bello Hastingensi*, by Guido of Amiens, supposed to be nearly contemporary with the event, and printed for the first time in *Monumenta Historica Britannica*, i. 856. There is not much to be said for our author's talent as a writer of verse. Like all writers of Latin verse in Gaul since the days of Venantius Fortunatus, he is fond of an accumulation of epithetic terms and synonymous verbs, which adds neither to poetical nor metrical correctness and beauty, e.g. v. 231:

"Sublimes, humiles, fortes, castos, sapientes  
Obruit, extinguit, comprimit, arcet, habet."

For the sake of his verse, he sins occasionally against grammar and syntax. There is little of the poet in him, but decidedly more inclination to reason about historical facts and their connection. He makes his heroes, Pope Stephen III., William the Conqueror, King Henry II., and others, deliver long speeches on given occasions.

The chronological arrangement of the work, evidently written in honour of the empress Matilda and her son, King Henry II. of England, is rather involved and full of episodes. Happily the author adheres in this respect to the programme which he has prefixed in the introductory verses. After having mentioned the two marriages of the lady, first to the emperor Henry V., a connection about which nothing new is said, and afterwards to Count Geoffrey of Anjou, as well as the accession of Henry II. in Normandy and in England, he proceeds to the early history of the Normans, calling them most unusually from Hastings' invasion and Rollo's occupation down to his own days almost exclusively *Dani*. After a short survey of the growth of the duchy of Normandy during the time of the last Carolingian and the first Capetian kings, we have the conquest of England by William, of course in a spirit inimical to Harold and the English. Here unfortunately we miss, owing to the first break, what the author wrote about the latter days of the Conqueror, his son William Rufus, and the beginning of Henry I. down to the battle of Tinchebrai, 1106. Farther on, at the opening of the second book, when the author returns to the coronation of Henry II. in 1154, he enters on another digression. After describing the last Merovingian king in his degraded and empty state, v. 1782:

"Intonsus barba residens, cum crine refuso  
Hac in parte sui scoticus esse cupit,"

he treats of the coronation of Pippin and Charles by Pope Stephen III., and of the empire of the great Charles, very much as was to be expected in the twelfth century, and from a native of the west of Europe. See v. 2026:

"Cum sibi subjectis servit Maguncia, Roma,  
Parisius, triplicem sic regit ille thronum."

After this the feuds between Henry II. and Louis VII. in 1167 and 1168, especially the capture of Chaumont-en-Bauvaisis are narrated with several digressions. We have first the invasion of Normandy by Otto I. (946), unfortunately mutilated by another break in the text, and then suggested by the marriage of Henry's second son Geoffrey to the daughter of Conan of Brittany, the fabulous correspondence between King Arthur, "qui tunc apud Antipodes degebat," prohibiting King Henry to annex the land of the Britons. The third book opens with the death of the empress Maud, on the 10th September 1167, and her interment in the abbey of Bec; after which the narrative is taken back again to the embassy sent by the emperor Frederick I. (1165), the betrothal of Henry the Lion, duke of Saxony, to the daughter of King Henry, and the papal schism between Alexander III. and Victor IV. (1159). Even the letters of the two pontiffs and the reports of their opposite councils, involving a succinct synopsis of imperial policy from Caesar down to Barbarossa, are turned

\* See also Wattenbach, *Deutschlands Geschichtsquellen im Mittelalter*, p. 360, No. 2, 2nd ed. 1866; and Potthast, *Bibliotheca Historica medii aevi*, Supplement, p. 66, 1868.

into distichs. The author deduces his arguments against the superiority of the king of France over Henry II. from the fact that the ancestors of Louis were not the legitimate heirs of Charles the Great. He rejoices in all successes of the Angevin king over his feudal lord; see v. 1746:

"Conclusos triplici Gallos tenet ipse ducatu."

But much more important than such reasoning is the character given to Archbishop Thomas of Canterbury, formerly the intimate friend of the English king, but now a fugitive in France. To the great disgust of the ultramontane editor, Becket is treated, indeed, very unfairly, as it could not be otherwise expected from such a decided partisan of the king. He is introduced for the first time on the occasion of the discord between the two kings, v. 2060:

"Exul abest Thomas antistes Cantuariensis,  
Foedera perturbat, proelia sola cupit."

Afterwards he is accused of having gained the favour of Pope Alexander by bribery, v. 3839, and with regard to the debates at the Council of Tours (1163), of which there is a long description, we have the very curious hint, v. 3933:

"Hic siluit Thomas antistes Cantuariensis  
Ut minus doctus verba latina loqui."

Towards the end of the poem there is mentioned a truce between the two kings, at Poissy, in February 1168 according to the heading, iii. 16, but in the Epiphany 1169 according to Robert of Thorigny. Here the author alludes once more to the uncertain position of the conspiring archbishop, v. 4333:

"Reddere iura sibi si dedignatur avita,  
Exul ab Angligenis iure perhennis erit";

and v. 4344:

"Nescio quid voluit, retro redire timet,"

perhaps the best evidence of the conclusion of the poem before Becket's death. The latest fact of which there is a record in the poem seems to be the visit of Henry the younger to Paris, v. 4245, which is dated by Robert de Thorigny 1169, in Purificatione Beatae Mariae (Pertz, *Scriptores*, vi. 518).

At the end of the poem, however (p. 65), are added from the same MS., and therefore indirectly from the same original, two lists of the jewels and ornaments bequeathed by the empress Maud to the church of Bec in her lifetime and after her death, and thirty-three distichs more, evidently in continuation of the poem, describing the return of the king to England in a gale, by which no other passage can be meant than that described and dated the 3rd March 1170 in *Gesta Henrici Secundi Benedicti Abbatis*, i. 3, ed. Stubbs.

That the work is the composition of a contemporary appears likewise from the description of Denmark, a country still pre-eminently known to an inhabitant of the lower Seine, v. 524, from the term *Metropolis Londis* (Lund), and from v. 536:

"Waldamarus ibi regia sceptrā regit."

The author is fully alive to the recent importance of canon law, v. 1492:

"Hinc fluvius torrens Gratianus ad alta redundat,  
Quo sine nil leges, nil ibi iura valent."

That he was a Norman, proud of his distinct nationality, is evident throughout the poem. The courtier may be discovered in v. 1732, where he insinuates too much consanguinity as the only reason of the divorce between Louis VII. and Eleonora of Poitou. That Bec is the local centre from which he writes is apparent from the vigour by which the church and castle of Poissy (Pisenum) are claimed by the abbey as its property (v. 1678), and more especially from the circumstantial description of the individual monk of Bec, who was despatched to inform the king of the death of his mother the empress (v. 2910):—

"Is regi notus tum carus tumque fidelis  
Hinc magis est iteris (sic!) dulcior ipse labor," &c.

It strikes me as if this must have been the poet himself, Stephen of Rouen, provided that the authors of the *Histoire littéraire de France* and Brial have come to the right conclusion. As for the title *Draco Normannicus*, the editor does not even hint whether it is actually prefixed to the work in MS. Its meaning can be no other than *vexillum*, the Norman standard.

It is not very easy to trace minutely all the sources from

which our author collected his knowledge of previous history. In the opening of the poem (v. 2), he professes magnificently:

"Ex propriis gazis edere pauca libet."

Referring to the British king Arthur (vv. 2803, 2804), he quotes "*liber Gildae sapientis*" and "*quae Monemutensis vera loquendo canit*." The description of Childeric III., the last Merovingian (v. 1762), agrees more in spirit than literally with the well-known first chapter of Einhart's *Vita Karoli Magni*. The author knew of course his more provincial historians, especially Dudo of St.-Quentin, who is quoted by name in the title (ii. 13) referring to the siege of Rouen by Otto I.: "Dudo ponit quod hoc fuit supra pontem portae Beluacensis;" cf. Duchesne, *Hist. Norm. Scriptores*, 131. He had some annalist at his disposal, and most likely the Chronicles of Sigibert of Gembloux and his continuators. The best of these, Robert de Thorigny, had been himself a monk at Bec from 1128 till 1154. On the other hand, Wace's *Roman de Rou* was probably not yet published, whereas the monk of Bec, who had very little poetical fervour in common with the *trouvère* from Jersey, must have been acquainted, as I have very little doubt, with at least the *Gesta Pontificum* of William of Malmesbury, from the way in which he mentions (v. 3957) the synod of Winchester in 1072, at which, in the presence of William the Conqueror, the quarrel between Lanfranc and Thomas of York was decided in favour of the first. Though the latest dates in the work are 1169 and 1170, and not February 1168, as Brial supposes (*l. c.* p. 298), I find no traces that the author wrote with a knowledge of Becket's letters, which were hardly collected yet. He relates what he either saw himself or heard from those who did. There are many more or less local details, however, which require more minute investigation both from Norman and English scholars, before a final verdict can be given about the historical value of *Draco Normannicus*.

R. PAULI.

### Intelligence.

We are in a position to say that M. Renan's *L'Antichrist* may be expected in the early part of next year. The previous statement in our columns on this subject was inexact.

"*Etruscan Inscriptions*, analysed, translated, and commented upon," by Lord Lindsay, is one of the books in Mr. Murray's list of works in preparation.

The first part of the long promised *Historical Atlas of Ancient Geography, Biblical and Classical*, compiled under the superintendence of Dr. W. Smith and Mr. G. Grove, is announced to appear in October. The work (which will be completed in five quarterly parts, price one guinea each) is to contain 41 maps of the size of those in Keith Johnston's *Royal Atlas*, together with descriptive letter-press and an account of the authorities used in constructing each map. The classical maps have been prepared by Karl Müller, the well-known editor of Strabo and the minor Greek geographers.

M. Taine is at present engaged on a History of the French Revolution.

The publication of Mr. Buckle's *Miscellaneous and Posthumous Works*, which were announced for the present season, is postponed till October.

A writer in *Fraser* (August) is disposed by fresh manuscript and other authorities to give full credence to the story of Olimpia Maldachini, sister-in-law and sovereign ruler of Pope Innocent X., as commonly told in the seventeenth century, though it was treated by Ranke as a mere romance. The life of this lady, which has been usually ascribed to Gregorio Leti, may, according to the writer, be of more trustworthy authorship.

According to *La Voix*, the autograph MS. of the memoirs of A. Khrapovitsky, Secretary of State to Catherine II., has been found amongst the papers of Prince Peter Vrazemsky. The two published editions are incomplete, and it is hoped that the original text of the work, which throws so much light on the private life of the empress, will now be restored.

SS. Tanfani, Paganini, and Lupi, of the archives of Pisa, are preparing to publish, by instalments, in 4to, *Le Iscrizioni della città di Pisa, raccolte ed illustrate*, with notes and facsimiles when desirable.

### Contents of the Journals.

Gött. gel. Anzeigen, June 5.—Reviews Gaston Paris' edition of *La Vie de saint Alexis*, a poem perhaps written by Tetbald of Vernon at Rouen in the eleventh century in assonant five-line strophes, which later hands

have changed first into the rhymed verses which the thirteenth century preferred, and then into four-line Alexandrines. The historical value of the poem is therefore great, and it gives us more insight into the old French dialects in some respects than even the Oxford "Roland," also of the eleventh century.—There is also a notice of Monod's book, *On the Sources of Merovingian History*; and Ewald refers to Wright's *Syriac Apocryphal Acts of the Apostles*, as illustrating the use of the word *συμφωνία* for a musical instrument in the Book of Daniel.—June 12.—Contains good criticisms of Stamm's and Heyne's edition of Ulfilas; and of Waddington's *Inscriptions grecques et latines de la Syrie*.—June 19.—Analyses Clouet's *Histoire de Verdun*, vol. ii., at length; and Kohl characterizes Cunningham's *Notes on the Natural History of the Strait of Magellan* as being unsatisfactory.—June 26.—Reviews Köpke's interesting *Kleine Schriften*.—Kohl takes an unfavourable view of Neill's *English Colonization of America during the Seventeenth Century*.

**Liter.** *Centralblatt*, April 27.—Notices Friedrich's *The Diet of Worms in 1521*, from the letters of the Nuncio Oleander. Friedrich (Döllinger's ally) found a copy of some of these at Trent; the originals at Rome are of course not accessible. He last year published *Turrecremata's De Potestate Papae et Concilii Generalis* from the Munich library.—May 4.—Analyses Ritter's examination of Sully's *Memoirs*, especially as to Henri IV.'s great plan of overthrowing the House of Hapsburg, and establishing a European peace; which Ritter shows to be unhistoric, and falsely attributed to the king either by Sully or Sully's secretaries.—A good summary follows of von Sybel's fourth volume of the *History of the French Revolution* (to 1797).—June 29.—Notices Max Müller's *Über die Resultate der Sprachwissenschaft*, as containing a corrective of Mommsen's views as to a "Graeco-Italian race," and of similar views in Schleicher and others.—Lugebil on the *Constitution of Athens* and Mommsen on the *Römisches Staatsrecht* are reviewed at length, the former with special reference to the archonship, the latter as to the tribunate.

*Bullettino dell' Istituto*, June, continues its account of the excavations at Pompeii and at Certosa. The latter show the rudeness of Etruscan art in the north as compared with what it was near the coast: some objects found at Eygenbilsen in Belgium prove how far Etruscan trade extended before the rise of Rome.—July and August.—Continues the account of the excavations at Pompeii and Certosa. The objects found at the latter illustrate the religion of North Etruria; nothing has been discovered that in the least reminds us of those ghastly beings of the nether world so often depicted in the vases and tombs of the southern region of Tuscany. An attempt is made to range the discoveries in their chronological order and progress.

*Periodico di Numismatica e Sfragistica per la Storia d'Italia*, Firenze, anno iv. fasc. ii., contains notices and a plate of the early coins of Camerinum in the thirteenth century, with the name of Bishop Ansovinus (a German name) on them, the bishops then having great temporal power. A list follows of the officials of the hospital at Altopascio, with a plate of six unedited seals. An article on the "vermillion cross on a white ground," the arms of Florence, given to the knights specially created by the people, contains a curious list of the knights appointed in the famous outbreak of the Ciompi in 1378, "Mess Salvestro" (de' Medici) heading the list.

### New Publications.

DE LUYNES, Duc. *Voyage d'exploration à la Mer morte, à Palmyre, à Pétra et sur la rive gauche du Jourdain*. Œuvre posthume, publiée par ses petits-fils, sous la direction de M. le comte de Vogüé. 4 vols. quarto et 3 atlas in fol. (Vol. 1 et 2: La relation du voyage laissée entièrement, manuscrite par le duc de Luynes, des recherches géographiques, historiques et archéologiques. Vol. 3: Un mémoire de M. Vignes sur la topographie etc., le journal de voyage à Karak et à Chaubak, suivis d'inscriptions arabes, traduites par M. Sauvaire. Vol. 4: La géologie, la minéralogie etc., réd. par M. Lartet.) Paris: A. Bertrand. (Trübner.)

REGISTRA QUORUNDAM ABBATUM Monasterii S. Albani qui saeculo 15<sup>mo</sup> floruerunt; vol. I. Registrum Abbatiae Johannis Whethamstede, Abbatis Monasterii S<sup>ci</sup> Albani, iterum susceptae; Roberto Blakeney, Capellano quondam adscriptum. Edited by H. T. Riley, M.A. (Rolls Series.) Longmans.

SCRIPTORES RERUM GERMANICARUM in usum scholarum ex monumentis Germaniae historicis recudi fecit G. H. Pertz. Godfredi Viterbiensis festa Friderici I. et Henrici VI. imperatorum metricae scripta, ex ed. Waitzii. Hannover: Hahn.

### Philology.

**Prophetæ Chaldaice.** Paulus de Lagarde e fide cod. Reuchliniani edidit. Lipsiae in aed. B. G. Teubneri.

HITHERTO anyone who has wished to use an authentic text of the Targums has been obliged to consult the rare editions published in the first century after the invention of printing. These were printed by Jews or Jewish Christians, partly in Portugal and Spain: as in Lisbon (1491—Onkelos), in Leiria (1492—the Proverbs; 1494—the Prophets), and in Alcalá (1517—Bible); partly in Italy: as in Bologna (1482—Onkelos), in Venice (where Daniel Bomberg, of Antwerp, established his celebrated press, and published, from 1518, the three large editions of the Bible, together with the Targums), in Sabbioneta (1557—Onkelos, with Massorah), and in other places. These editions were based upon the MSS. The later ones in common use among Christian scholars reproduced the editions of Alcalá and Venice, but unfortunately not without alterations.

After Elias Levita had advised the forming a Chaldee grammar for the Targums from the Aramaic text in Daniel and Ezra to the neglect of the MSS. (see preface to his *Dictionary*, 1541), a tendency arose not only to correct the vowel system of the old editions, but also, on the pretext of their superfluity, to diminish the use of the *matres lectionis*. This was done by Le Mercier in his edition of the Targum of the Minor Prophets and some Megilloth (1557, preface), and also by the elder Buxtorf in his Rabbinic Bible, on which the Targum texts in the later polyglots were based.

Very little was done in editing Targums by Christian scholars of the succeeding centuries, but the following editions—all from MSS.—should be noticed: Taylor (two Targ. of Esther, 1655), Terentius (Job, 1663), Beck (1680 and 1683, Chronicles), Wilkins (1715, Chronicles). The last edition of a Targum was that of J. D. Michaelis, who in 1775 reprinted the Targum of Hosea, edited by van der Hardt in 1702. There were of course several Jewish reprints, on which v. Steinschneider, *Zeitsch. d. Deutsch. Morg. Ges.* xii. 171, and cf. Frankel, *Zu d. Targ. d. Proph.* p. 40, note.

It was only on October 1, 1857, at a general meeting of the German Oriental Society held at Breslau, that it was resolved, on the motion of Prof. Brockhaus, of Leipzig, to promote and support a critical edition of all the Targums (*Z. D. M. G.* xii. 195, 199; xiii, 320), but this resolution was never carried out.

Semitic philologists will under these circumstances share our great joy at seeing that Prof. de Lagarde has broken the ice, though we regret to add that this has not been done without personal sacrifice, for he has once more had to defray the whole cost of printing. In the hope of giving a solid basis to the grammatical study of the Targums, he chose the oldest extant MS., viz. the Codex Durlacensis (A.D. 1105), which contains the Nebhiim of the Jewish Canon in Hebrew, with the Targum wrongly ascribed to Jonathan bar Uzziel. It was bought at Rome by Reuchlin in 1498, and was used by P. J. Bruns, who collated parts of the Hebrew text for Kennicott's Bible (cf. also Eichhorn's *Repertorium*, xv. 174). From this codex we have here a most exact copy of the consonant text of the Targum. In the very rare cases where the MS. has lacunae they are filled up from Bomberg's first edition of 1518. The editor was not in a position to add the vowel-points of the MS., as this would have considerably increased the expense. But this omission is not to be greatly regretted, for the reconstruction of the probable pronunciation of Aramaic words depends chiefly, we think, upon etymologic reasons under the guidance of the *matres lectionis*, which are of course

left untouched. We fear that an investigation of the vowel system of the Reuchlin MS., for which the editor seems disposed to make further sacrifices (p. iv), however useful it may be, would have only a negative result. It would probably show that the punctators of the Targums did not follow a tradition of any great age or authenticity, but merely fixed a very late pronunciation which had already become arbitrary and corrupt. Must we not indeed infer the absence of points from the use of a double ' or 1 to express the consonant sounds, while for the vowels we have the single *matres lectionis*? Besides, Elias Levita maintains that the Masorites paid no attention to the vocalisation of the Targums, and expressly states that the very old MSS. which he saw had no vowel-points at all. We must perhaps admit one exception, in the case of the vocalisation hinted at in the Massorah of Targum Onkelos, but this was fixed by the Madinchāē, and seems to depend upon the actual pronunciation of the Eastern Jews as influenced by Syriasm (v. Geiger, *Z. D. M. G.* xviii. 649, 657).

After the text of the Targum itself (pp. 1-489) there follow (pp. 490, 3-493, 32) from the same MS. the Reshū-jōth or Harmōnin ("licences"), i.e. introductions in which the Turgemān asks leave of God and the congregation in the synagogue for reciting the Haftarah. Nos. 1, 2, and 5 are the most interesting: 1 and 5 rhymed; 2 an acrostic; 1 and 5 alphabetic, and followed by an acrostic of the name of the Paitān (cf. Prof. de Lagarde's conjecture on Ps. xxv. and xxxiv., *Academy*, vol. iii. p. 12). No. 6, which is in prose, praises Jonathan bar Uzziel as a disciple of Haggai, Zechariah, and Malachi. No. 7 and 8 contain the liturgical blessings of God after finishing the Haftarah. (On all this v. Zunz, *Gottesdienstliche Vorträge*, pp. 380 a, b, and 356 d, and *Literaturgeschichte der synagogalen Poesie*, 1865, pp. 19 and 79 c.)

Besides a detailed description of the Reuchlin MS., the comprehensive preface contains (pp. vi-xlii) the whole of the marginal notes to the Targum, which are of great importance. They consist of fragments of different Targums to many passages, and are often of considerable extent. The longer ones are marked (1) "Jerusalem Targum," (2) "Other Targum," (3) "Other Book," or (4) the two latter notes are combined (v. pp. xii, 17; xxxiv, 20; xxxviii, 19). The shorter ones and those which refer to single words are marked "Different" and "Other Expression."

Now classes 1, 2, 4, to judge from their contents, all contain Jerusalem Targums, but the difference of their marks suggests that the Turgemānin, who had to read the official Targum in the synagogue, used to increase the Jerusalem glosses already extant in their own copies from the margin of other copies which they happened to meet with. For "Other Book" means another MS. of the official Targum (cf. p. xv, 11, on 1 Sam. v. 11), and it is not probable that in later times they borrowed from a complete Palestine Targum of the Prophets. How little the marginal notes of the Reuchlin MS. exhaust what contemporary and later Rabbins knew of this Jerusalem Targum may be seen from the fact that quotations from it made by Rashi (who died in the very year that the codex was written), Kimchi, and others, do not exist in the MS., except one Targum of the Haftarah, Is. lxvi. 1, but this has about twenty-five words more than in the Vatican MS. (v. these quotations collected by Zunz, *Gottesdienstl. Vortr.* pp. 77, 78).

Since the language of all the Targums, as is shown by its grammatical peculiarities, is a Palestine-Aramaic dialect, we have to seek the origin of all in Palestine (v. Nöldeke, in *Gött. gel. Anz.* 1872, p. 831). The differences, lexical and other, find their explanation in the different histories of these interpretations after they were transplanted

from their native soil into Babylonia and other countries. We know also from Zunz's and Geiger's researches that among the Jerusalem interpretations of the Pentateuch—and to these the fragments first edited by Prof. de Lagarde bear a twin likeness—we possess pieces of the oldest and least refined of all Targums. To these the Aramaic versions of the Hagiographa come nearest in affinity, as has been acknowledged for centuries; while on the other hand the Targum Onkelos of the Pentateuch and Targum Jonathan of the Prophets have passed through the Babylonian schools, and have been so cleared of old exegetical additions and alterations, and so formed word for word from the Hebrew text, that even their Aramaic idiom has become but an artificial and defaced language.

The present form of the Targum of the Prophets is ascribed by the tradition of the Turgemānin—wrong as to the person, but right in its conception of a Palestine origin—to Jonathan bar Uzziel. But in fact it seems to depend for the most part on the redaction of Rabbi Joseph ben Chama of Babylon (ob. 325), who laid great stress on the Targums as a source of exegetical information (v. Frankel, *Zu d. Targ. d. Proph.* p. 11, line 1). From the method of interpretation followed in this official Targum, that of the Jerusalem Targum in de Lagarde's edition is not in its essence different. The peculiarities which Frankel quotes are here again met with, but with fuller extension and licence. What there is old in them, what added at a later time, can only be decided by examining the single passages; but in many instances we have in these incoherent fragments common matter which points to an earlier cycle of legends. Cf. e.g. on Josh. xiv. 15 and xv. 13 with xxi. 11 (Gen. xxiii. 8); Josh. xv. 16 with xviii. 17; Judges v. 4 ("the dew which will resuscitate the dead of Israel") with Targ. of Ps. lxviii. 9, 10, Talmud Chagiga, 12 b (Levy's *Dict.*); Jud. xii. 8, 9, with Targ. Ruth i. 1, iv. 17: Boaz = Ibsān, cf. Mercerus' edition. Sometimes it is evident that in one gloss another is inserted, as in Jud. v. 5, where the lines p. x, 21, עני—xi, 12, טכין, are a second Targum.

Of course all these marginal notes contain valuable contributions to the Aramaic dictionary, but it will not be always easy to decide whether we have before us a genuine Aramaic expression or one moulded on another—as the Arabic—pattern. I should think e.g. that "meth'arkhin," *they quarrel*, is formed from the Arabic "muta'arrakin" (v. Berggren, *Guide français-arabe vulgaire*, s. v. "battre") rather than from the Hebrew "arakh milchāmāh." Are Mohammedans meant in x. 24?

Very frequently the glosses contain several synonyms of vessels and implements having different names in different countries, e.g. Judg. iii. 22, *goad*, Jerus. (and Peshita) "mas-sāsā," cf. Arab. "minassat"; iii. 19, three terms for *leather* or *skin-bottle*; iv. 21, *hammer*, "arzapp'thā," Eastern Targ. (and Syriac), "marzapp'thā," Palestine (cf. v. 26); the Arab. has borrowed both forms, "irzabbat" and "mirzabbat"; *ibid.*, *peg*, "d'shār," Arab. disār; vi. 19, three terms for *kettle* and two 1 Sam. ii. 14; vi. 38, *bowl*, the terms λεκάνη and lagenā, cf. Targ. Job xxxii. 19. In like manner we have *neck-ornaments* in Judg. viii. 21, 26, and *concubine*, viii. 51. To another class belong "qibhl- = q'dhām-", p. ix, 25; three terms for *bind*, Jud. xv. 10; instead of "paggar," of the official Targum (Jud. vi. 25), we have "pakkar," which, as far as we know occurs only in the Jerusalem Targum, marked "Other Expression."

A few marginal notes refer to different vowel-points, as Judg. iv. 13, "karkē" and "k'ake"; 1 Sam. i. 6, Pael and Afel; &c. But we may not dwell longer upon these highly important notes.

It is only for practical reasons that the editor (v. his

statement, preface, p. xlii) calls the idiom of the Targums "Chaldaic." This name as used for "Aramaic" seems indeed older than Jerome, for Berosus uses *χαλδαϊστί* for an Aramaic or at least a Semitic dialect (ed. Richter, p. 50; Euseb. *Chron.* ed. Majus, i. 11). The Palestine Jews would have said "Syriac," the Babylonian "Aramaic" (v. Nöldeke, *Zeitsch. d. Deutsch. Morg. Gesell.* xxv. 116).

Among other interesting etymologies, Prof. de Lagarde proposes (p. xliii) to identify the Syriac "paddān" with the Persian "paitidāna"; but my honoured friend and teacher now authorises me to state that he withdraws the application of this to Paddan Aram. The latter is very probably identical with what was afterwards known as the village of Paddānā, in the neighbourhood of Charan.\* This identification was expressly made by Barbahlul, who knew the village, in a MS. belonging to Dr. Socin, s. v. *Pāran dārām* (sic), and long before was assumed by Ephrem in the *Carmina Nisibena*, p. 31, i., 33, ii. (v. Bickell, p. 138).

We beg to invite particular attention to what deserves a notice beyond our present space, viz. the emendations, &c. of the text of the Hebrew Bible, to which the editor devotes five pages at the close of the preface. Of these emendations fifty-eight refer to the Psalms, thirty-two to Isaiah, seventeen to Job, five to Kings, one corrects Col. ii. 16.

We must, in conclusion, not omit to note the excellent getting-up of the work, and especially the solidity and clearness of the Hebrew type, obtained by Prof. de Lagarde for the university printing-office at Göttingen. It is the more to be regretted that there was not a sufficient supply of type to provide some diacritical points. In this, as in other respects, there is still much need of additions which would render the press more worthy of the university and of such works as that now before us. G. HOFFMANN.

**Assyrian Dictionary.** By Edward Norris. Part III. Williams and Norgate.

**An Assyrian Grammar.** By A. H. Sayce, M.A., Fellow and Tutor of Queen's College, Oxford. Trübner.

It is with special pleasure that we notice the appearance of these two works, which are equally creditable to their authors, and hopeful omens for the young study of Assyriology. The third part of Norris' great Assyrian dictionary treats of the vocabulary from the letter M to nearly the end of N, thus comprising only two letters. The reader will see from this with what thoroughness the material has been examined. We could wish, however, that the author had limited himself more in the selection and particularly in the quotation of authorities, or had at least been more sparing in the use of cuneiform characters. We should think an exact transcription would be almost as useful for the student, since the original texts have been already lithographed in the English and French collections of inscriptions. An exception would be only necessary in quoting from an unpublished text.

Plan and mode of treatment are the same as in the two first volumes, and though (as we remarked last year in the *Academy*, vol. ii. pp. 49, 50) we should have preferred a different arrangement, it is clear that no alteration was any longer possible. We therefore heartily welcome this fresh proof of the extensive reading and unabated energy of the author, who works with an unpretentiousness which marks the great scholar, only anxious for the due exhibition of facts. We reserve the expression of our dissent with reference to certain points of detail for an intended publication of our own two Assyrian

glossaries, and we will only point out the importance of this volume for the historical study of religion, inasmuch as it includes the names of all the Assyrio-Babylonian divinities.

We now pass to the Assyrian grammar of Mr. Sayce. Like the preceding work, it makes altogether the impression of conscientious research, and is, all things considered, a valuable addition to Assyrian literature. The author himself states that it is designed especially "for comparative purposes," and we have no doubt that Semitic philologists will duly appreciate it under this aspect. A number of points of view indicated by the author are, in the highest degree, deserving of attention. The part on the formation of nouns in particular is not only in a high degree accurate as a representation of facts, but furnishes most interesting illustrations of the relation of Assyrian to the cognate languages. We are also glad to find that the author has avoided several misleading and incorrect views of recent Assyriologists, which spring from a too hasty combination of the peculiar phenomena of Assyrian with those of other Semitic languages. The remarks on the pronouns and numerals are mostly such as we entirely concur with. It is otherwise with the verbs. Here we cannot help expressing grave doubts as to many of the theories proposed by Mr. Sayce. Not that his account of the fundamental features of the Assyrian verbal formation is not substantially accurate, but it seems to us that he has attached too much weight to the authority of Dr. Hincks, eminent as this lamented scholar must be admitted to be. He has thus been misled into adopting a number of tense and mood distinctions, the existence of which in Assyrian cannot be at all proved. We hope to return to this subject in another place, and therefore abstain from entering into further detail, as also from following the author in his sketch of the Assyrian syntax, in our opinion one of the most meritorious parts of the book. We may be allowed, however, to express a regret, which has repeatedly forced itself upon us in perusing the work, relative to the omission of references for the examples adduced. Not that these have been selected arbitrarily; indeed, our own reading enables us to guarantee their reliability. But the reader who is less acquainted with these new studies, and perhaps somewhat sceptically inclined, may be excused for wishing to control the author's statements by a reference to the *data* on which they are founded. In many cases, too, the Assyriologist himself will desire to test the character of the example by an inspection of the original text, simply on the ground of the variety of interpretation to which cuneiform writing is liable. After giving this free expression to our wishes, we once more congratulate both authors on their excellent works, and trust we may often meet them again in the field of Assyriology. EB. SCHRADER.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 56.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The Editor cannot reply to questions from authors respecting the notice of their books.*

*The next number will be published on Tuesday, October 1, and Advertisements should be sent in by September 27.*

## General Literature.

Érasme. M. Durand du Laur. Two volumes. Paris :  
Didier et C<sup>ie</sup>.

ERASMUS stands at the end of a period as Abelard stands at the beginning: the real significance of both is to be found in the success with which they hustled one system of education out and ushered another in. The essential qualifications for such a function are incompatible with real depth, which cannot exist apart from reverence. If Abelard and Erasmus had understood what they displaced, they would have been encumbered by their respect for it. As it was, they were earnest enough to go through with their work, not too self-forgetful to be flippant, and shallow enough to be plausible. In other respects they differed widely: Abelard was haughty, pugnacious, impulsive, and brilliant; Erasmus was cautious, insinuating, and capricious. Abelard, in spite of the great scandal of his life, was of a temperament to which austerities are not unwelcome; Erasmus was decorous as a matter both of interest and of conviction, but in him the craving after physical, sensuous comfort was something ineradicable. Both came into conflict with traditional orthodoxy without exactly intending it, for neither was capable of realising the way in which a great system hangs together; and they imagined that they were only protesting against the obstructiveness of a clique of pedants, while they were really attacking the essence of Catholicism. Even here there was a difference. Abelard's proposal to recast Christianity by the aid of dialectics was put forward openly upon positive grounds, and he persevered with it till the final collapse into penitentialism, when no price seemed too high to pay for inward and outward peace. And the superfluous offence he gave was by a spirit of personal rivalry, the impulse to conquer and outshine every distinguished teacher of the day on his own subject. Erasmus shrank from all personal disputes and rivalries, but his irrepressible sense of the ridiculous frequently led him beyond the limits within which he desired to remain. Both Erasmus and Abelard succeeded completely in giving a new direction to education; both aimed at giving a new direction to opinion, and upon the whole it must be said that they failed. Abelard failed completely; Erasmus succeeded to the extent of founding a tradition which survived and propagated itself through underground channels till it emerged again to swell the torrent of the eighteenth century. The difference between their methods may account to some extent for the difference of their fate. In the twelfth century instruction was still democratic, and the idea of open questions was still in the distance: rationalists knew of no limits to the efficacy of reason in solving all intelligible questions to

VOL. III.—NO. 56.

the enlightenment of all willing minds. Abelard was at once a gladiator and a demagogue having perfect confidence in himself and inspiring perfect confidence in his hearers; but he roused the full strength of orthodoxy when it was strong, and he was shattered in the contest. The close of the fifteenth century found what knowledge was still left in the possession of a narrow body composed almost exclusively of those who, if they did not exactly make a trade of knowledge, valued it only or chiefly as an instrument of professional advancement. The aim of Erasmus was to transform this professional body of learned men into something more rational, to replace their fixed unintelligent traditions by flexible opinions intelligently held, and to diffuse just enough enlightenment among the upper strata of lay society to act as a solvent to professional obstructiveness, a stimulant to professional inertia. To put it shortly, Abelard wanted to convert the world to knowledge, Erasmus to influence society by the instructed public opinion of the enlightened classes. In this he has been plausibly compared to Voltaire, though perhaps neither he nor Voltaire would have considered the comparison exactly complimentary, as Voltaire in spite of the *Henriade* was an amusing writer, and Erasmus, in spite of more than one shabby episode, was upon the whole an honest man. In fact, if it is hardly to the credit of the middle ages intellectually that they left the mind of Europe in a condition to be amused and dazzled by the wit and humour of Erasmus, it is hardly to the credit morally of the influences which succeeded mediaevalism that the Voltaire of the fifteenth century, nurtured in the midst of the ecclesiastical corruption which is supposed to have justified all the stupidities and brutalities of the Reformers, should have been, after making all allowances, so much more serious, more moral, and more reasonable than the Voltaire of the eighteenth. But in spite of this double contrast there is an obvious foundation for M. Durand du Laur's parallel. Both led for many years the life of missionaries of culture, and both attained the position of heads of the commonwealth of letters, that is to say, they were beyond dispute the foremost members of a cosmopolitan clique which had unbounded influence over public opinion and very little upon the opinion of the people. Both were in favour of leaving the framework of things as they were with as little disturbance as possible, and both by their railery prepared the way for much more sweeping changes than they desired. Both, too, succeeded in getting the changes which they did desire patronised by the heads of the society which they were sapping. Voltaire got the pope to give him relics for his church at Ferney. Erasmus got the blessing of Leo X. upon his paraphrase of St. Paul. Both, lastly, had a natural talent for superficial servility; both, especially Erasmus, had an inextinguishable hankering after personal independence. In one respect Voltaire was the most fortunate; he outlived the conservative attempts to put him down, and he died before any liberal had seriously attempted to put him aside. Erasmus passed the last eighteen years of his life under a cross-fire of increasing severity between the monks, who had got a chance at last of persuading the world that the precursor of Luther must be dangerous, and Luther himself, of whose proceedings and surroundings he conscientiously disapproved.

The Reformation was from every point of view an immense misfortune to Erasmus. His European reputation really rested on the fact that on his return from Italy the Germans had selected him by acclamation as their foremost scholar. When Luther appeared, the *literati* who had given Erasmus his position were with scarcely an exception swept away by the new movement. No doubt Erasmus might have been the titular chief if he pleased, but neither his con-

science nor his vanity would have been satisfied with a nominal command, and Luther was too massive to be thrust aside as he himself had thrust aside Carlstadt. Then Erasmus saw that, whichever side won, the victory would be a defeat for "good letters and evangelical philosophy": if the Dominicans put down Luther they would prove to the satisfaction of all conservatives that there was no safety away from scholasticism; if Luther held his own, still much that Erasmus was anxious to keep would have been abolished, and more than one repulsive paradox would have been established; and both results would have been reached by an appeal from the cultivated to the uncultivated, from common sense to passion. His course during the crisis has been stigmatised as cowardly, but it was not cowardice which kept him from throwing in his lot with Luther. It was really his fear of Luther and of the public opinion which Luther led which made him give exaggerated expression to his fear of the pope and talk about his unfitness for martyrdom. For a moment Luther, with his astonishing arrogance, actually took the Patriarch of the Humanists at his word, and offered to patronise and protect him as a timid disciple, well-meaning, but too weak to act up to his convictions. Put in this way the offer was too transparently insulting; the Reformer should have talked of respecting the honourable scruples of an elder generation; but he was too impetuous to imagine honest and intelligent opposition as possible. Erasmus was not too cowardly to be piqued by the monks into giving them a great deal of needless provocation in his *Colloquies*, at a time when it was really possible that an ill-advised journey on the part of a man who was always travelling might give them the chance of burning him: he allowed Luther to provoke him at last into an imitation of his own scurrility; but if we ask why he was so long in writing the book on the *Freedom of the Will*, and so much longer in completing his rejoinder to Luther's reply, the only answer is he was afraid of giving offence by coming into collision with the Reformers. If further proof is wanted that it was the revolution that he feared even more than the reaction, it is to be found in the energy with which he pressed the necessity of concessions on all the authorities whom he expected to influence. He was emphatically a "man of order," and men of order are for the most part timid; the only question is whether their timidity shall take the form of repression or of conciliation. The form that Erasmus' timidity took was not determined exclusively by his fear of the Reformers, it was determined also by his real indifference to the points in dispute. He could see Luther's antinomianism, he could not see his spirituality, and though he was attached to the historical continuity of the church, he neither understood nor valued Catholicism. What would have pleased him best would have been that the church should go as far as possible without stultifying herself in the direction of abolishing distinctive Christianity, while energetically propagating as much of the morality of the Gospel as could plausibly be grafted upon the morality of Plutarch. It is curious to reflect, when we come to measure what the Reformation permanently effected, that it really succeeded exactly so far as Erasmus approved of it, and that this modest success has been rather compromised than facilitated by the spasmodic efforts which have been made on a perpetually dwindling scale to persuade mankind of the vital necessity of going through an imitation of Luther's imitation of the spiritual conflicts of St. Paul. The common sense of Erasmus approved of the Reformation exactly so far as it was a safe and sensible attempt to make religion a good deal more natural and a little more fervent. It might perhaps have been expected that, after having appealed to common sense against Catho-

licism, Protestantism should have been subjugated by its own ally; but it is curious that Erasmus should have divined so exactly the terms of the ultimate arrangement which might be maintained indefinitely if knowledge were as stationary as common sense.

The success with which Erasmus anticipated the judgment of posterity is a measure of his real force and depth, and may serve to explain what needs explaining, the immense position which he acquired among his contemporaries.

He had nearly everything against him. His position was low; his character was not imposing; though his manners were winning, he could not profit much by the favourable impression they created. He was too fastidious, too capricious, too independent to be a pleasant person to patronise, and his transparent attempts to play off one patron against the other generally ended in his falling between two stools. From the time that he left his monastery he was always posing without effect as the victim of circumstances; he was constantly making enemies by indiscretions, like coupling Budaeus with Badius, indiscretions which proceeded not so much from an unwillingness to recognise distinction in others as from an inbred poverty of nature to which frank recognition of greatness was not congenial. As a scholar he was too omnivorous to be refined. Plutarch was his favourite philosopher. In the *Ciceronianus* he never touches the fundamental question. If Latin was a living language, no doubt the Ciceronians were wrong; but if so, the language of the *Epistolae Obscurorum Virorum* was a legitimate though hardly a desirable development, and Erasmus' proposal to reform it on the model of the classics in general was about as reasonable as an attempt would be now to chasten the style of modern journalism into a tolerable resemblance to the sober dignity of the Elizabethan age. But we do Erasmus an injustice when we treat the *Ciceronianus* as a work of disinterested criticism; it is really an attack upon Roman neopaganism, which the author did not venture to assail more directly because most of the neopagans occupied high ecclesiastical position; though their attitude affronted his respect for the person of Christ, which in his latter years at any rate seems to have been the strongest and most permanent of his feelings. He did more than perhaps any other one man to familiarise the world with Christian antiquity; but his want of transcendental insight prevented him from understanding it; he assumed that the Bible was to be interpreted throughout on common-sense assumptions, and when the Fathers interpreted it otherwise, he could only suppose that their judgment was warped by the necessity of combating heresy.

His political views were no deeper than his theological. He disliked oppression, and he had a keen sense that the interest of sovereigns was easily separable from that of peoples; he had the *bourgeois* horror of war to such an extraordinary extent that he actually maintained the prudence of buying off an invasion; it is needless to add that, like all advocates of peace at any price, he assumed that a nation can develop itself indifferently in any direction which at a given moment is physically possible, and that therefore, if development in one direction is obstructed by another nation, it is always a waste of power to endeavour to remove the obstruction by war.

Of course this only amounts to saying that, like Voltaire and the other writers of the *Aufklärung*, Erasmus was essentially superficial and one-sided; but he had little or nothing of their literary perfection. His wit, with few exceptions, is of the order

"lusco qui possit dicere lusce."

His irony consists of saying the reverse of what he means, and reminding the reader at short intervals that "this is said kinder sarkastical;" but with all these defects of matter

and manner, he shared with the men of the eighteenth century the one inestimable talent of discovering the line of least resistance for the numerous minds which liked to think that they thought. His forcible fluency constantly gave his contemporaries the satisfaction of the *bourgeois gentilhomme* when he learned that he had been in the habit of talking prose.

His best work is the *Praise of Folly*, where the satire, though still rudimentary, is at least two-edged; it reminds us of the *Utopia*, as that reminds us of such a really great work as *Don Quixote*. Cervantes' thesis is quite as much that the world is no place for a man of honour as that knight-errantry is obsolete and ridiculous; More's thesis is not only that existing European society is irrational, but that no rational society is possible, since an attempt to follow reason issues in the grotesque absurdities and immoralities of *Utopia*: Erasmus' thesis is not only that dignitaries are generally fools, but that to obtain success of any kind, either practical authority or the voluptuous ecstasies of transcendental pietism (for which Erasmus' early work, *De Contemptu Mundi*, shows a curious hankering), it is necessary to repudiate the good sense which was the idol both of his judgment and his desires.

M. Durand du Laur's two volumes are full, accurate, and intelligent, everything but masterly: consequently he fails to give as vivid an impression as such an inaccurate writer as Jortin (whom apparently he did not think it worth while to use), and the plan of treating the "Vie" and "Oeuvre" separately leads to a good deal of repetition; but the painstaking, straightforward diligence of the writer gives the book a value of its own, besides its convenience in making the researches of Low Country scholars accessible to the general public.

G. A. SIMCOX.

**The Tale of Frithjof.** By Esias Tegnér. Translated from the Swedish by Captain H. Spalding. Murray.

CAPTAIN SPALDING must of course be aware, though there is not a word in his preface to show it, that he has had many predecessors in the labour he has taken on himself. The presence of many competitors would seem naturally to demand a special carefulness on each new candidate for the laurels of translation; and it is rather surprising that this handsome volume should contain so little that is satisfactory from a poetical point of view. Before he undertook to translate a work so illustrious for melody as *Frithjofs Saga* is, Captain Spalding should have assured himself that he had the requisite power and a due flame of enthusiasm, while in fact it is plain that he is too little a poet to be a poet's interpreter, and equally plain that he has faltered and grown weary, at times, of his work. However, it is good, in spite of Captain Spalding's shortcomings, to be brought once more face to face with the Bishop of Wexio's beautiful masterpiece, and so saying, let us pass from the translator to the poet.

No attempt is made in this volume to add to the critical or controversial history of the poem. The writer has contented himself with adding a few notes on the Norse mythology, and then has left the text to introduce itself, without a word to show when, how, or why it was originally written. Now that all the various streams of flattering or adverse comment have subsided in the course of half a century, it is obvious that *Frithjofs Saga* has a fixed and important position among the classics of modern times, and in spite of all just or unjust criticism will be read and valued to the end of time. The year of its original publication, 1825, is the culminating point in the Swedish literature of our century, and since then it has been impossible for any poet in Sweden to write without being in some wise influenced by its mannerisms.

The history of Swedish poetry is encumbered by the grotesque names of many warring schools. During the earliest years of the present century, the field of poetry was pretty equally held by two of these, the Academic, who clung to old-established forms, and the Phosphorescent, who, represented most fully by Atterbom, brought in an ideal element and studied the newest theories of Tieck and Novalis. In opposition to both of these there arose, a little later, headed by the eminent Geijer, another active school, known as the Gothic, which, rising on the ruins of the two former, rallied round a national and antiquarian banner, and repudiated both the conventional and the German tendencies in favour of aims more directly Scandinavian. Out of this last, and yet with a certain arrogance holding himself aloof from it, rose Tegnér, whose desire was to collect all the best from all the schools, and form thereby a standard of excellence for all future time. *Frithjofs Saga* was the result of this endeavour, and as soon as it appeared, the victory of its author was complete, and a new period began. Since *Frithjofs Saga* Sweden has possessed no Phosphorists and no Goths.

The Icelandic saga from which Tegnér gained his plot and the suggestions for his characters differs in no important feature from the rest of its class. It paints in simple colours, or rather in mere black and white, the wild sea-faring life by barren fjord and holm, before Christianity came with its southern glow of sentiment and tender emotion. Frithjof is drawn as a Viking of the most masculine sort, of superhuman strength and daring, a man who gives hard blows, and has no fear of gods or men; King Helgi calls him "a wrongdoer who heedeth no place of peace," in other words, a sacrilegious person, for whom sanctuaries have no terror, if their barriers restrain his passions. Through the whole saga blows a stiff northerly gale, interpenetrated with sharp salt savours. He who will may read it in Mr. William Morris' exquisite English. But turn to Tegnér, and one finds a Frithjof of the Provençal order, a delicate troubadour sighing among nightingales and roses, while odorous winds carry the murmuring sounds of flute and guitar through such woods as Scandinavia never saw. The contrast is complete.

That the spirit of Tegnér's poem is different from that of the old sagas and of ancient Norse poetry generally, has always been admitted at the outset; but whether the author erred or no in his latter-day treatment of the theme, and how far the modern element in his epic spoiled it as a whole, have been questions productive of much violent discussion. One thing is evident enough, that Tegnér took his immediate inspiration, not from the saga literature itself, but through the medium of contemporary writers. In Sweden several poets, Geijer for instance, and Ling, had already handled old Scandinavian subjects, but the real origin of Tegnér's bias for these is to be found in the splendid successes just then being achieved in the same field by Öhlenschläger. Tegnér has admitted that the form and spirit of the latter poet's *Helge* exercised a strong influence over him when he was planning *Frithjofs Saga*. Now to us in these days of antiquarian research and artistic realism, it is easy to see that the rhetorical and ornamental style of Öhlenschläger, however beautiful in itself, was very far from adequately representing the spirit of the pagan times, but half a century ago it was not so easy, and probably Geijer was the only man then writing who formed a just conception of what a Viking should be. The idealising soul of Tegnér found rest in the treatment that Öhlenschläger suggested; he added to the vigour of the Danish poet his own peculiar sweetness and polish, and the result was a poem which will always be one of the most lovely in the language, but in

which the execution of the constituent lyrical parts must be felt to clash with the great epical basis. And this is why its influence on succeeding writers has been pernicious; *Frithjofs Saga* has been a magnificent upas-tree, distilling the poisonous dews of feebleness and unreality down on all poets that have sat under its branches.

It must be remembered that the criticism of our day demands a sterner, or at least an exacter, realism in art than that of Tegnér's generation did. In the earlier years of the century a tinge of semi-religious sentiment was demanded from a poet dealing with mythological themes. Considering this, and remembering how completely Tegnér was a man of the time, it is interesting to read his own estimate of *Frithjofs Saga* as embodied in a letter to Franzén. "My design was," he says, "to present a poetical picture of the old Scandinavian heroic life; it was not Frithjof as an individual, but the time which he may be taken to represent, that I wished to paint . . . . In the saga there is much that is grand and heroic, which holds good for all time, and so both could and should be retained, but there is also a certain rough and barbaric wildness, which ought either to be altogether thrown out or at least to be toned down. On the one hand the poem ought not to outrage our finer customs and ideas too much, and on the other hand what is national and healthy and natural must not be sacrificed; a cold winter air, a fresh wind must blow through the poem, for it belongs to the northern climate and character, but not so that the quicksilver freezes, and all the tenderest emotions of the heart are sealed."

No one can complain that the quicksilver freezes in *Frithjofs Saga*. It is one of the warmest and purest love-poems of modern times, and must build an everlasting niche for its author high on the northern front of the Temple of Fame.

EDMUND W. GOSSE.

*Journal et Correspondance de André-Marie Ampère.* Publiés par  
Mme E. C. Paris.

THE name of André-Marie Ampère is not so well known in England as it should be, but those who are best acquainted with his titles to fame will be least prepared for the light in which he appears in the present little volume. It is difficult to recognise the irritable, absent-minded mathematician, whose blunders were one of the standing jokes of Parisian society, in the ingenuous hero of a short and simple love story, which is so very short and so very simple, that being sad as well, it is also very pretty. And yet to those—like his son and a few intimate friends—who believed Ampère's genius to be of the order of Newton, Kepler, or Copernicus, the discrepancy between his powers and his achievements, considerable as the latter were, always seemed to need explanation, just such an explanation in fact as is afforded by the untimely conclusion of his juvenile romance, and its effect upon his sensitive, indolent, versatile character. A similar blow, the death of his father, one of the victims of the Jacobins at Lyons, in 1793, had reduced him to a state approaching idiocy, and when, after the interval of a year, his mind regained its activity, the direction of his studies was completely changed. As a child his mathematical precocity was on a par with Pascal's; at eighteen he knew as much, according to his own account, as ever afterwards, and his father might with good reason write, just before his death: "Quant à mon fils, il n'y a rien que je n'attende de lui." But mathematics were forgotten in his grief, and for long afterwards. Rousseau and botany roused him from his stupefaction; he had learnt Latin once to read Euler, he learnt it again to read Horace; the classical poets were his companions as he wandered in search of botanical specimens,

and he came back at night to write dramas and idylls. Three years of this desultory existence bring him to the opening of his own idyll.

"1796. Dimanche, 10 avril. Je l'ai vue pour la première fois." This is the first entry in a journal where proper names are scarcely needed, for there is but one "she" in the world to Ampère. She lends him a book, she is not at home, she tells him not to call so often, she asks him for some verses; he eats a cherry she has dropped, he helps her over a stile; she finds fault with his dress, she talks about his prospects, she tells him not to do this or that "before people." And so for three mortal years, and many pages of round schoolboy handwriting, intermixed with much of  $x$  and  $y$ , the good innocent youth prolongs a courtship which might have melted a harder heart than that of M<sup>lle</sup> Julie Carron. She married him at last, though he had nothing in particular to live on, because he was thoroughly good, very much in love, and in some inscrutable way had succeeded in convincing her imagination that despite his *gaucherie*, his social ineptitude, he was really a remarkable man. This discovery is the more creditable to M<sup>lle</sup> Julie's perspicacity because there was no one in their neighbourhood qualified to do justice to Ampère's talents, and he himself had hardly yet realised their existence. It took him eighteen years to find out that he was shortsighted, and it took him longer still to discover that he was one of the first mathematicians in France: Julie did not wait for the discovery, and it was made the sooner for her sake.

Julie, whom we know from her own and her sister's letters, as well as from André's journal, seems to have been a pretty, clever, and eminently sensible young woman, the reverse of emotional, very fond of her husband, and prudent enough for two; but her crowning merit was the happy tact with which she distinguished from the first between the man and the *savant* lodging together in her sheepish lover's frame: she sets the one remorselessly to rights about his wardrobe, his private pupils, his behaviour in society, but she receives the assurances of the other with the implicit faith that is the best encouragement; she believed in the goodness of André's brains as she believed in the goodness of his heart, by direct intuition; the praise of others confirmed, but did not alter her judgment, and she valued it chiefly as promising an increase of income. Such a wife was peculiarly valuable to a man like Ampère, who had all the childishness of genius in a singular degree. Her sympathy would have encouraged him to sustained effort, and the wish to justify her preference would have stimulated him to original discoveries, of which he could lay the reward at her feet. Unfortunately, after the birth of a son, Julie's health gave way, and within three years of his marriage André became a widower, just as a brilliant career seemed to be opening before him.

The remainder of his life was not unprosperous. He had valued friends, his son was all that could be wished; he even married again. But those who knew him best thought him sad; they looked upon him as a man to whom something was wanting, and that is exactly the feeling that seems to have haunted him in his most brilliant successes. He was constantly comparing what he might have done and what he might have been with what he was; he looked in vain for a substitute for the immediate personal motive to exertion which he had lost, and he was too much discouraged by this first failure to try and dispense with such an incentive altogether. What he did was the least, not the most, of which he was capable. In the lives of the greatest discoverers one engrossing scientific interest seems to swallow up all the rest, but the universality of Ampère's genius was against him here. The subjects which had the strongest attraction for him personally promised him little increase of fame;

being naturally unambitious, he was not deterred by this consideration; but from what we know of Julie, it is allowable to conjecture that she would have suggested to her erratic philosopher to keep to the point and attend to one thing at a time; she would have discouraged his metaphysical reveries, not because metaphysics may not be as good in themselves as chemistry or commerce, but because Ampère's talent for the luminous co-ordination of facts could be so much better employed than upon the few and uncertain facts of psychology. The unpractical André persuaded himself that he was doing as good service to science by satisfying his own curiosity about the foundations of knowledge as if he had been constantly adding to its superstructure; he had an uneasy feeling of disappointment when the world thought otherwise, and declined to give as much weight to his philosophical convictions as to his scientific demonstrations.

Still it is unfair to speak of his career as a failure. The powers of his mind were dissipated amongst many objects instead of concentrated upon one, and the positive result of his work was diminished in proportion, but that is all. His great discovery, that of the law according to which the magnetic needle is attracted and repelled by electric currents, is one which, according to Arago, scarcely any other man in Europe could have made. It required a genius for hypothesis as well as a genius for experiment, and the verification of his hypotheses was the first *proof* of what Oersted's observations only suggested, namely, the common origin of electric and magnetic phenomena. When it is added that this demonstration was substantially perfected in seven days, Jean-Jacques Ampère's estimate of his father's powers seems scarcely exaggerated. In controversies relating to sciences with which he was less familiar, and there are few of which he was altogether ignorant, he almost always took the side of the minority that was in the right; many happy conjectures must have been lost when he burnt an early work on *The Future of Chemistry*, in a fit of religious remorse at its audacity. His interest in electro-magnetism cooled after two or three years, and as he grew older his mind presented a very curious combination of indolence and impetuosity. He would hold forth for thirteen consecutive hours upon a theory of the universe; when he was dying, he rebuked a friend for declining a discussion on the ground of his health: "Between us there should be question of nothing but Eternal Truths!" Yet the books on his shelves were mostly uncut, only here and there sawn open by a clumsy finger, and he gave in all good faith as a reason for declining an important appointment that he would have before accepting it to read two short memoirs, by a writer whom he esteemed, on a subject in which he was much interested! And all the while he was engaged upon a *Classification of the Sciences*—of which he enumerated 168—and he was so far from being indifferent to the results of modern speculation that he was personally pained if any one, knowing his peculiarities, would maliciously cast a doubt upon one of his favourite opinions, the reality of space, for instance, or the possibility of a new race arising as superior to men as men to mastodons; some one asked him what he, Ampère, would be the better for the latter event, and his surprise and distress at "the inconceivable stupidity" of the demand were quite pathetic.

The last letter given in this volume is dated 1805, about a year and a half after his wife's death: it is to Elise, her sister and confidante, whose lively and circumstantial letters do even more than the naïf entries in André's journal to transport us into the midst of the happy family, so soon, alas! to be broken up. He speaks there of the "moral apathy" which constitutes his existence. A little later, at

the beginning of his correspondence with Maine de Biran, he says that his condition is substantially unchanged, but he has "begun to derive some satisfaction from researches in psychology." These researches gave him the same kind of consolation and distraction as he had found in literature after his father's death, but the results to which they led were little more substantial. He approached the subject at what, for him, was an unfortunate time. The whole bent of his mind was opposed to scepticism: it was too active, too inventive to rest satisfied with criticism; his appetite for knowledge was insatiable, and because he could digest the most abundant materials, he was loth to believe that the materials available for his use could be scanty. Hence a kind of facility of belief, which he himself called "credibility," and a consequent preference for realism, as offering most objects of immediate knowledge. "A quoi sert le monde?" he asked: "à donner des idées aux âmes;" and he failed to reflect that this result, the possession of ideas by the soul, remained the same whether the ideas came from within or from without. His desire for certitude required something more comprehensive than the truths of particular sciences, and even these truths seemed to him to be called in question by modern idealism. Partly from the indolence already referred to, he never quite succeeded in mastering the philosophy he rejected; he confounded phenomenalism and scepticism, putting Kant and Berkeley on a line with Hume, and for scepticism he had a moral aversion; it was the vacuum which his intellect abhorred. His misconception of the tendency of modern speculation was the more unfortunate as it led him to begin his classification of the sciences—an undertaking for which his encyclopaedic attainments rendered him eminently fit—at what must be called the wrong end. His divisions are ingenious enough, but they are entirely arbitrary; he only enumerates and classes the various possible objects of knowledge or thought, and assigns a separate science to each group. But if such a classification is to be more than a learned *jeu d'esprit*, it must rest on a psychological basis, and Ampère's genius would have been fitly employed in correcting and formulating the laws which regulate the relations of phenomena *in the mind*, still subject—if he pleased to think so—to subsequent verification by comparison with patent objective realities. In fact the "théorie des rapports," which his son celebrates as a discovery scarcely less important than "Ampère's law," is a statement, though not a solution, of this problem: it is also the most original feature in his metaphysical system, which would otherwise have little to distinguish it from Maine de Biran's spiritual eclecticism. He defines a sound hypothesis as one which not only explains why things are as they are, but why they could not be otherwise. Now the existence of external objects is a hypothesis, but *if* they exist and cause, those two facts explain not only why their effects, our sensations to wit, are what they are, but also that they could not be otherwise, for an effect is something which follows necessarily from the nature of the cause. But if our sensations have no external cause, they might just as well be altogether different. Therefore the first hypothesis is to be preferred. (There is a curiously similar argument in Mr. Herbert Spencer's essay on "The Universal Postulate.") The existence of external objects is first suggested to us by our consciousness of sensations caused by some Not I: causality is a relation, and the reality of this relation is directly evidenced by consciousness, consequently the existence of relations is a reality, and therefore the things related are also real. Compared with other ways of arriving at a foregone conclusion, the argument is not without ingenuity. We perceive a thing by sense, but only know it by its relations, and he proceeds to

distinguish two classes of relations, those that express material resemblance and difference, and those (like space and time) which, being independent of the nature of the terms in which they are expressed, appear to be applicable to noumena. The primary qualities of things are the relations of noumena to each other, but we can only know those relations which exist between phenomena as well as between noumena; infinite possibilities of knowledge remain beyond our grasp, or, as Ampère expresses it with characteristic melancholy fervour, "Que de rapports de noumènes invinciblement ignorés!" He attempts to qualify the dangerous doctrine that knowledge is only of relations by the saving clause that true knowledge must reflect the relations of "things in themselves," but the admission is still tantamount to a concession to idealism; the relations are the same, whatever the names by which the objects related are known, but he omits altogether to explain what ground we have for supposing that *any* of the relations of noumena are similar to or identical with those which we discern amongst phenomena. The fact was that he never really thought out the system to fragments of which he was passionately attached; and it is possible that his son, in endeavouring to harmonize the disjointed records of his opinions, may have made them at once more coherent and less plausible, more consistent and less suggestive, than they would have seemed in their natural and original disorder.

Good or bad, Ampère's metaphysics have nothing to do with the readableness of the book which tells the story of his first love. As an amusing study of character, and a picture—a most favourable one—of the moral tone and mental cultivation of the provincial *bourgeoisie* of France during the Revolution, it would be interesting even if the hero had never been anything but an obscure usher. It may seem a questionable compliment at the present day, but the letters of the two sisters almost remind us of the correspondence between Richardson's Clarissa and Anna, Harriet and Charlotte; they are not nearly so long, much more lively, and perfectly easy and natural, but they are quite as literary, and, to complete the analogy, while Julie is always self-possessed, tranquil, and impeccable, Elise is lively, passionate, satirical; both are cleverer and better educated than, in spite of Richardson, we believe was commonly the case with their English contemporaries, and the cause must be the good effects of centralisation in literature. Till the present century there was only one literature in France, and that was the best; those who read at all read this, and though culture was not universal, whatever there was of it was good of its kind: the standard was the same at Paris and at Polémieux.

H. LAWRENNY.

#### LITERARY NOTES.

M. Émile Montégut, in his "Impressions de Voyage et d'Art" (*Revue des deux Mondes*, Sept. 1), gives a very interesting description of the château de Bussy, in the Côte-d'Or, where M<sup>me</sup> de Sévigné's scandalous cousin, the count de Bussy-Rabutin, spent his time in continuing to deserve the exile to which he had been condemned for his *Histoire scandaleuse des Gaules*. Like the châteaux of Tanlay, which belonged to the Colignys, and Ancy-le-Franc, built in the sixteenth century by the house of Clermont-Tonnerre, acquired by Louvois at the end of the seventeenth century, and recently recovered by the heir of the first owners, Bussy has escaped not only undestroyed, but unaltered since the days when, as has been said, Bussy-Rabutin amused himself by turning it into a standing commentary and illustration of his book. The walls and ceilings are covered with portraits, allegorical devices, mottoes, and embodied slanders, which, though not always of artistic value, are of the greatest interest to students of the literature and history of the period. One room is set apart for the portraits of the greatest generals of all times and

countries—Condé, Cromwell, Gustavus Adolphus, Spinola, Wallenstein, &c.—with whom it was one of Bussy's most harmless foibles to believe he might, but for the royal injustice, have competed on equal terms.

The copy of the *Diurnali* of Matteo da Giovenazzo mentioned in a note of the *Academy*, July 1 (vol. iii. p. 246), proves to belong to an edition printed in the seventeenth century, and consequently can throw no light upon the question whether or not they were forged in the sixteenth century; however, a new edition is to be published, based on the printed text, those hitherto in existence having been taken from various MSS.

In the *Allgemeine Zeitung* (August 28, 29), Dr. Sepp attempts to connect the legend of the holy house of Loretto with Indian, Greek, Mahomedan, Scandinavian, Keltic, and other legends of miraculous and migratory sanctuaries on the one hand, and on the other with an old Italian tradition of the landing of Aeneas with his household gods at Laurentum, which would make the black Madonna of Loretto the direct representative of the dark Acca Larentia. Both views are intrinsically plausible, but at present a little more direct evidence is needed to make them acceptable.

A correspondent of the *Journal de Saint-Petersbourg* describes the magnificence of an illuminated copy of the sacred writings of Buddha, in the language of Thibet, which is being executed for a Mongol prince; it will consist of 108 folio volumes, of which 80 are completed, all in letters of gold, and bound in embroidered silk with silver clasps. The copyist is to receive 30,000 roubles (about 5000*l.*) for the whole work.

Bishop Nicholas Grundwig, well known as a collector of Danish national songs, &c., died on the 2nd of September. He was born in 1783; his first work on Northern mythology was published in 1808, and his enthusiasm for the provincial literature of Denmark continued all his life unequalled except by his dislike of the political influence of Germany. As priest and bishop, his liberal views met with much opposition among the clergy; but they augmented rather than impaired his popularity as a man of letters.

In the *Contemporary Review*, Mr. J. A. Symonds translates some of Michael Angelo's sonnets, from the new and corrected edition by Signor Guasti. He is very successful in straightening the involved constructions of the original, and the clearness is attained without any sacrifice of dignity; of course, something must be lost in poems which Wordsworth pronounced altogether untranslatable; and in this case it is perhaps the crowded richness of thought and imagery which is Elizabethan rather than Miltonic.

In the *Fortnightly Review*, Mr. Swinburne dwells on the passages of poetical beauty in Victor Hugo's *L'Année terrible*, and objects that most of the author's critics are desirous of gathering figs from the vine, and grapes from the fig-tree. He excuses the exaltation of Paris, with all its faults and follies, by suggesting that the Paris of the poet is a kind of ideal city—metropolis of regenerate humanity; but he thinks a few lines of penitence for the sins (beginning with the Roman expedition), for which *L'Année terrible* was the expiation, would not have been out of place.

*Blackwood* and *Fraser* contain alarmist articles on the industrial future of England, the former in the prophetic manner of the *Battle of Dorking*, the latter by "W. R. G." According to both articles, high wages mean high prices and diminished profits, and short hours mean diminished production; high prices mean lower purchasing power of wages, diminished profits mean transfer of capital to other trades, and diminished production means foreign competition, and all these together mean the impoverishment of the country through the ignorant greed of the working-classes; to which Mr. Greg adds, with justice, that the Poor Law interferes with the free action of supply and demand on the labour market. Mr. Harrison, in the *Fortnightly Review*, in treating the same subject, has the advantage of borrowing from Mr. Brassey (son of the great

contractor, and author of a candid book on *Work and Wages*) facts which are more consistent with the present commercial prosperity of the country and of better augury for its future. From these it appears that the cost of labour is very nearly the same all over the world, skilled labour being as much more efficient as it is higher-priced than unskilled, while its higher price stimulates the invention of mechanical contrivances for economy, which again call for more skill in the workman and still more ample remuneration. Similarly a day's work, whatever its length, varies very little in productiveness, the explanation of which lies in the remark of a workman to Mr. Harrison: "A man who can't tire himself out in eight hours isn't worth his salt;" that is to say, the expenditure of the maximum of physical strength in the minimum of time is an art to be acquired like others, and great skill in it fairly commands a high price. Capitalists using the best machinery and the best labour find that they can produce faster and cheaper now than formerly; and Mr. Harrison, as a positivist, infers that the trade of the country ought to be left to those who have proved themselves able to direct it most economically. But when we learn how very nearly stationary wages have been in almost all English trades during the last twenty years, it appears doubtful whether capitalists can be depended on to give a fair share of their growing profits to their employes, unless the competition of co-operative societies is added to the wasteful pressure of strikes. All three articles seem to look upon the struggle between labour and capital as a question of class rivalry, and deal more with the rights of each class against the other rather than with their duties to themselves and to the society of which they are each only a part. Mr. Greg thinks that the capitalist has a right to workmen at "reasonable" wages, and that the public has a right to have its bread baked and its coals dug by the classes that have been in the habit of baking and mining; and though this is not exactly true, in practice the capitalist and the public have never yet failed to find workmen for wages very well within their means. Mr. Harrison, on the other hand, asserts the right of the miners, for instance, to be idle three days a week if they like, which is undeniable; still, for their own sakes and that of society, they had better work all the six days unless they have something decidedly better to do; if they have, or when they have, and society wants more coal than they supply, it will have to employ fresh miners to the relief of more crowded employments. England is certainly rich enough to support her population, and no class is interested in diminishing the total wealth, only in modifying its distribution, which Mr. Greg would not assert to be perfect. The only way to do so without pauperisation, and with production at its present standard, is to divide the work to be done more equally amongst all who want wages, and to make the minimum wage sufficient for the decent maintenance of its recipients. Till this point has been reached, it is premature to talk about the "extravagant demands" of labour, for society as a whole is plainly concerned to secure necessities to all before allowing luxuries to any.

### Art.

#### ART NOTES.

During Mr. Layard's short tenure of office at home, he initiated what might have proved an enterprise of great extent and utility. Everyone is aware of the constant and gradual waste of the remains of antiquity which is taking place in this country. With the view to arrest the progress of this incessant dilapidation, at any rate in one direction, Mr. Layard projected a complete "Catalogue of such Regal and other Historical Tombs or Monuments existing in cathedrals, churches, and other public places and buildings, as it would be desirable to place under the protection and supervision of the Government with a view to their proper custody and preservation," and he applied to the Society of Antiquaries of London to furnish him with such a list. The council of the society met on February 23, 1869, and accepted with alacrity the onerous task proposed to them, pointing out at the same time that the labour of drawing up, even with approximate accuracy, such a list as that proposed in the letter from the Office of Works was one of no small magnitude, and would of necessity occupy considerable time. By

the beginning, however, of 1872 the committee appointed by the society to consider and act upon the application which had been made to it, had completed their labours in so far at least as regards the Sepulchral Monuments of England and Wales. The report presented by them was adopted by the president and council and forwarded to the Office of Works. But Mr. Layard was no longer First Commissioner, and painful misgiving seems to have come across the mind of the council lest all the trouble and expense which they had taken upon themselves at his instance should prove fruitless. For in the letter which accompanied the Report they express their wish "to be informed whether Her Majesty's Government designs on its own part to lay this Report and Appendix on the table of both Houses of Parliament for public information." Remembering the peculiar style in which the duties of First Commissioner of Works are discharged by the person who now fills that important office, it will not surprise anyone to find that the doubts of the council of the Society of Antiquaries were well founded, and that, beyond the copy of the correspondence and catalogue printed in return to an order of the House of Commons, no further result will come from Mr. Layard's wise and seasonable project. We find from this correspondence that the present First Commissioner, who is apparently wholly ignorant of, as well as indifferent to, the past history of his own country, not only declines to afford government aid in the preservation of these perishable records of the past, but has snubbed the Society of Antiquaries in the style of a pert attorney for the trouble which they have gratuitously undertaken. He writes back in acknowledgment of the receipt of the Report and Appendix that the object contemplated could not apparently be accomplished without legislation, and that there is no intention either of introducing a Bill or of laying before Parliament the Report which has been made by the Sepulchral Monuments Committee. The whole affair is thus at an end. Meanwhile we have in our hands the very valuable and careful catalogue of the Society of Antiquaries, which is in itself a most important document for the purposes of English antiquarian research. The list is confined, agreeably to the terms of the letter (written February 13, 1869, by Mr. Layard's instructions), to the tombs and monuments of occupants of the Throne and members of the Royal Family, or of such other persons as could fairly be considered, in respect of their actions or writings, to have distinguished themselves in the political or literary history of England. And the enquiry has been brought down to a date as late as anyone could desire, for it extends to the monuments of all those persons who died before the year 1760, that of the accession of George III. It will be seen that in the framing of these resolutions regard is not paid to the value of the monuments as mere works of art, but to the importance of the persons commemorated as actors in the great drama of national history. In this aspect it was felt that the simple gravestone which marks the interment of John Locke was more worthy of record than any more sumptuous monument erected to a person who had left no trace behind him in the history of his country. The committee distributed the counties of England and Wales amongst such of the Fellows of the Society, whether members of the committee or not, as appeared most likely, from their local knowledge or other reasons, to be able to furnish satisfactory information as to the monuments in existence in the districts assigned to them. These returns were made on a uniform plan, suitable for tabulation, and the list was finally prepared by the committee from the materials thus obtained. The list is arranged in two tables. Table A contains the personal and chronological arrangement in two divisions: first come the Regal monuments, and secondly the Historical, in which the claims of men of science, of authors, artists, actors, and musicians, are not forgotten. Table B gives the monuments described in Table A, but arranged topographically, according to counties and parishes, in alphabetical order. It is needless here to say anything in praise of the orderly method and thoroughness with which the scheme has been carried out. The names of Mr. Perceval, Mr. Oldfield, and Mr. Knight Watson, are in themselves a sufficient guarantee.

The *Gazette des Beaux-Arts* for September 1 contains:—A notice of the retrospective exhibition at Vendôme and of Vendôme antiquities. The notice is accompanied by an interesting

etching of La Poissonnière, the old manor-house in which Ronsard was born, by M. A. Queyroy.—A second article on the South Kensington Museum by M. René Ménard.—A critique by M. Henry Havard on the most remarkable examples of the Dutch School exhibited in Amsterdam in 1872. This paper is to be continued; the first section comments the Rembrandts, the Frans Hals, the van der Helsts, and a fine composition of van den Tempel, an artist whose work is rarely to be met with even in Holland. The present work belongs to the *Wale Weeshuis* (a charitable institution), and represents four directors of the establishment; it is so masterly and remarkable a painting as to justify to a certain extent, says M. Havard, the opinion pronounced by M. Viardot, that the most of van den Tempel's works pass in galleries at the present day under the name of van der Helst.—Letters of Vien and Lagrenée, forming the eleventh article of the correspondence of the directors of the French Academy at Rome.—London Exhibitions (first article), by M. Eugène Müntz. The writer says regarding English jewellery as represented *en masse* at the International, "a few examples will suffice to show that of all the heresies, of all the barbarisms, of all the nonsense, of which an art can be capable, not one has been avoided by the masters on the other side of the Channel." In support of the justice of this opinion M. Müntz brings ample proofs.—Two etchings after Rembrandts in the Hermitage, by M. Massaloff, have an accompanying text by M. Émile Galichon.—A paper on Byzantine Architecture in France is an extract from an unpublished portion of the third edition of M. Alfred Michiels' work, *L'Architecture et la Peinture en Europe du IV<sup>e</sup> au XVI<sup>e</sup> Siècle*, which is on the point of appearing.

Herr R. Bergau writes to the *Zeitschrift für bildende Kunst* to say that there occurs in the fourth number of *Nürnbergische Künstler* (p. 47) for the year 1831 the unsigned statement that the celebrated "Gitter von Messing" made by Peter Visscher and his sons for the grave of Fugger, at Augsburg, but subsequently purchased by the town council of Nürnberg, and placed in the town-hall, to be eventually (in 1806) sold, was not melted down as supposed, but was then in the garden of a private person at Lyons, this person refusing offers for the purchase of the work in question made to him by King Louis I. of Bavaria. Herr Bergau has vainly endeavoured to obtain any information on the subject, and communicates the above to the public in the hope that some one else may be more successful in discovering the present fate of this valuable treasure.

A second edition of M. Georges Duplessis' useful work, *Les Merveilles de la Gravure*, has recently appeared.

A very considerable collection of works of art and curiosities, having principally a local value, is to be sold by auction at Danzig on September 26 and 27. The collection was made by Professor Schultz, director of the art-school at a time when Danzig was richer than it is at present in this class of objects. The catalogue contains, amongst other paintings, four remarkable portraits by the old Danzig painter, Andreas Stech; many miniatures of value, chiefly of kings of Poland and Danzig patricians; ebony caskets distinguished for the beauty of their workmanship, ivory reliefs, and old glass. A separate division is formed by old Chinese, Japanese, Meissen, and Berlin china, and much of the antique furniture is said to be of genuine and considerable value. Professor Schultz has been obliged to resign his post on account of decaying health.

### New Publications.

DICTIONNAIRE ARCHÉOLOGIQUE DE LA GAULE. Époque celtique. Publié par la Commission de la Topographie des Gaules, sous les auspices du Ministère de l'Instruction publique. 3<sup>e</sup> fascicule. In-4, avec 9 planches, gravées et légendées.

DANETT, Alfred. Ranolf and Amohia; a South Sea Day Dream. Smith, Elder, and Co.

GIRARDIN, Émile de. L'Égale de son fils: les droits de la femme et les devoirs de la mère. Paris: Michel Lévy.

HEIGEL, C. Th. Ludwig I., König von Bayern. Leipzig: Duncker und Humblot.

JACOBY, Dr. Johann. Gesammelte Schriften und Reden. Hamburg: Meissner.

KEATS'S Endymion. Illustrated by E. J. Poynter, A.R.A. (Six Engravings on steel.) Moxon.

PRADÈRE, O. La Bretagne poétique: traditions, moeurs, coutumes, chansons, légendes, ballades etc. Paris: Librairie générale.

SCHÖNE, Richard. Griechische Reliefs aus Athenischen Sammlungen: xxxviii Tafeln in Steindruck, mit erläuterndem Text. Leipzig: Breitkopf und Härtel.

STIELER, Rob. Illustrationen zu Franz Schubert's vorzüglichsten Liedern. (In Farbendruck.) Leipzig: Arnoldische Buchhandlung.

### Theology.

Three Lectures on Buddhism. By the Rev. Ernest T. Eitel. Hongkong: at the London Mission House. (Trübner.)

The Wheel of the Law. By Henry Alabaster, Esq. Trübner, 1871.

MR. EITEL has intended to give, in this pamphlet, a complete picture of Buddhism. The first lecture is a *résumé* of its history, the second of its doctrine, and the third is an account of the various forms it has assumed in the different countries where it prevails.

It may be supposed that these lectures, delivered in China, probably before a very mixed audience, on a subject which would fill volumes, cannot have great scientific pretensions; and the author himself refers such of his readers as may desire to study the subject more deeply to another work, to which the one before us may serve as an introduction (see preface). Our business therefore is only, in the interest of the general reader, to enquire if the author has been sufficiently complete in his exposition, exact in his appreciation, and impartial in his judgments. He appears to us to have fulfilled satisfactorily these various conditions, and with regard to the third, to deserve especial praise, seeing that his publication is in reality a polemical work.

For he not only proposes to set before us the history and doctrines of Buddhism, although that may be his principal and avowed object: he also intends to weigh its merits, and to show that this religion, professed by so great a number of men, cannot satisfy the wants of the human soul, as a rival of Christianity. This set purpose makes itself felt throughout the work, but does not prevent the author from doing justice to his adversaries; he points out the moral truths which Buddhism has proclaimed, and even the scientific laws of which it appears to have had a presentiment.

In his first lecture, Mr. Eitel is engaged on the similarity which exists between the life of Buddha and that of Christ. The subject does not cause him uneasiness, because, according to him, the Buddhistic writings on which this similarity is founded are posterior to the formation of the evangelical canon. Although the age of the different Buddhistic treatises is still far from being fixed, yet it is certain that the legend of Çākyamuni was gradually developed; and that in its latest form it is comparatively recent. But the ease with which it is possible to explain this similarity should not be a motive for exaggerating it. Why say, for example, that Çākyamuni was baptized? Is it intended to connect the Gospel narratives (Matt. and Luke iii., Mark and John i.) with the episode of the two currents of hot and cold water which two serpent-kings cause to descend from heaven and wash the body of the newly born babe? (*Lalitavistara*, chap. vii.) We need not, in order to avoid the error of those who see in Christianity a mere imitation of Buddhism, fall into the opposite extreme. Christianity and Buddhism are perfectly independent of each other. Still, one cannot

but admit that there exists in certain doctrines, in certain narratives, and especially in certain exterior institutions (such as monachism) a similarity which may lead one to infer a mutual influence. But in explaining these points of connection, our first care should be to define them, not to multiply them unnecessarily.

In the third lecture, which contains the newest matter, and in which northern Buddhism is described in an interesting manner in its most curious and most popular legends, the author, in speaking of the Adi-Buddha, returns to the important question which he has already touched upon more than once, that of Buddhistic Atheism. The last king of Siam was right when he said to a European traveller (Bastian, *Reisen in Siam*, p. 20) that the doctrine of the Adi-Buddha (primitive or primordial Buddha) resembles Christianity more nearly than any other. It certainly satisfies monotheistic tendencies up to a certain point; but this metaphysical speculation cannot be the basis of a true Theism. Buddhism, it must be admitted, is a religion without a god: it places in man, and in him alone, the elements and means of deliverance. The supreme justice which it recognises, and which determines the destinies of men, the Karma, is an impersonal, unconscious force, which we might call blind were it not for the harmony which it ordains between human fortunes and actions. In considering all great questions, the divinity, the Nirvâna, we must carefully distinguish between popular superstition, which instinctively rejects the negative conclusions of a subtle and obscure philosophy, and this philosophy, which deduces with inexorable rigour consequences from principles. In Buddhism, more than in any other religion, there is a great difference between what the vulgar believe and what the learned teach; for in no religion is science more profound, more inaccessible, more impenetrable, and at the same time more ready to adapt itself to the belief of the crowd. Buddhism is not an idolatrous religion, and yet there is no religion in which idolatry is more general. It is, or at least it has become, a nihilistic religion; and yet the mass of its followers are far from comprehending or admitting the negative conclusions of its most learned doctors.

The *Wheel of the Law* is properly the name of Buddha's first discourse, which contains the essence of his doctrine, and may, by extension, designate the entire system. Mr. Alabaster has nevertheless given this title to a volume which is neither a special treatise on the fundamental *Sûtra* nor a complete exposition of Buddhism; but he justifies his appropriation of the name by the plan of his book, which presents this religion to us under three different aspects—1st, the spirit of reform and of philosophical transformation; 2ndly, the maintenance of tradition; 3rdly, superstitious exaggeration. As the diversity of these subjects admits of a rather vague and general title, the author could not find a more expressive one than that which he has chosen.

This book treats solely of Siamese Buddhism. The author himself declares that he is not a "scholar"; but knowing Siamese thoroughly, and having long lived among the Thai, he has given us the fruit of his studies and observations. Such assistance rendered to erudition by men who do not make it their profession may be most useful, but its value is in proportion as the authors are more or less acquainted with the works of the learned. Mr. Alabaster acknowledges this himself in his preface. An educated and intelligent traveller may translate a Burmese or Siamese religious book: if the book is original, well and good, but if it is merely a version of a Pâli book, the work is no longer of the same importance.

The volume before us is not, properly speaking, a book; it is a collection of three distinct pamphlets, completely

independent of each other. The preface tells us under what circumstances they were composed, and why they were brought together; it concludes with a defence of Buddhism from the strictures of M. Barthélemy-St-Hilaire. Mr. Alabaster reproaches the French critic with having written in a spirit of partiality, with attributing to Buddhism social and political consequences which are not traceable to it, and finally with judging the Buddhist religion in too unfavourable a manner. We cannot here enter upon the grave questions raised by this controversy; but we shall presently have occasion to make an observation which proves how difficult it is to carry on discussions of this kind. For the present let us notice the three pamphlets which compose *The Wheel of the Law*.

I. "The Modern Buddhist" appeared separately in 1870; it is therefore no longer a new work. Mr. Alabaster hoped to prepare his second edition with the assistance of the Siamese author, late minister of the last king of Siam, and a sharer in the projects of reform entertained by his sovereign: but the death of this distinguished man has thrown Mr. Alabaster on his own resources. The new edition contains but little fresh matter. The following, however, is both new and rather curious. Dr. Caswell had observed to the learned Siamese that the triumph of Buddhism, by condemning all men to celibacy and the convent, would end in the extinction of the human race (it is to be remarked that this reproach was in India addressed to Buddha himself, from the beginning). The Siamese, being embarrassed, answered in an evasive manner, saying, among other things, that Buddha had not intended to found a universal religion; yet universalism appears to be one of the pretensions of Buddhism, and is a feature in which it resembles Christianity. On this subject Mr. Alabaster makes the following remark:

"Had I been in our author's place, answering from a Buddhist point of view, I should have said that, as Buddha recognised that all existence in this world was unsatisfactory and miserable, the suggested cessation of the renewal of the species was not a matter to be at all deplored."

Has Mr. Alabaster considered that, by these words, he has given an advantage to M. Barthélemy-St-Hilaire, who reproaches Buddhism with its "incurable despair," its "fanatical aversion for this life," its "inconsolable sadness in a world which it does not understand"? (*Le Buddha et sa Religion*, pp. 141 and 161). Does he think that a religion founded on such notions is favourable to the development of the human faculties?

II. "The Life of Buddha" is the translation of a Siamese book entitled *Pathomma sampho Hiyam*, from which Palégoix borrowed the *résumé* of the life of Buddha which he gives in his *Description du Royaume Thai* (ii. pp. 1-23). By this translation Mr. Alabaster has furnished us with a Siamese life of Buddha, as Bigaudet has given us a Burmese life, Foucaux a Thibetan and Nepaulese life, and Beal a Chinese life (see *Academy*, vol. iii. p. 46-50). We need not point out the interest attached to these different versions of the same subject. It is remarkable, for example, that the Siamese work, though differing in a number of details from the Lalitavistara, is constructed on the same plan; that is to say, it embraces the same period of the life of Buddha (the first thirty-five years), whilst the Burmese work includes his whole life. But here an all-important question arises. Is this work purely Siamese? We already know that the Burmese book translated by Bigaudet,\* the *Mâlâlanakara-vatthu*, is of Pâli origin. The Siamese work translated by

\* There exists another translation by the American missionary, Chester Bennett, more complete than the first edition of Bigaudet. It is strange to find no allusion to this work, which, indeed, did not appear separately, but was published in the *Journal of the American Oriental Society at New York* (vol. iii.).

Mr. Alabaster appears to us a similar case; for there exists a book in Pāli, the *Pathama Sambodhi*, of which the Siamese title quoted above is only an alteration (the word *jūāna*, represented, according to Mr. Alabaster, by the termination *yan* in the Siamese title, does not figure in the Pāli). There are, in the National Library in Paris, sheets of this work forming nearly a complete copy. On comparing this manuscript with the translation of Mr. Alabaster, we notice that the division into chapters is not the same; but that the two works are very similar, although the correspondence is not always exact. It is difficult to admit that one of the two works is not derived from the other. The Pāli work is not canonical; but what is its place in Pāli literature? What relation does it bear to the Siamese work? These are points to be cleared up; and we recommend them to the notice of Mr. Alabaster, in case he should, with the perseverance which appears to belong to his character, set himself one day, as he expresses a hope of doing, to revise and perfect his book.

III. The "Pra-Bat" (Holy Foot) contains two parts: the journey of the author to a celebrated place of pilgrimage, and the description of the sacred foot-print. The first is calculated to interest all readers; concerning the second, Mr. Alabaster does not deceive himself, and expects but a moderate success. We may take a lively interest in Buddhism itself, and but very little in the "Holy Foot." Burnouf said that this point would always be of secondary importance; but he said this at the conclusion of a long and minute study of the 65 signs of the Pra-Bat (*Lotus de la bonne Loi*, p. 623, &c.). Mr. Alabaster, who makes a similar observation, nevertheless gives a plate representing the 108 signs of the same Pra-Bat. This number of 108 seems to be the exact number of these signs, though for a long time this was an undecided point—Low reckoning 96, Burnouf 69, Baldaeus 68. Does the merit of the number 108 consist, as Mr. Alabaster suggests, in its being the product of the square of 2 multiplied by the cube of 3? It is impossible to say; but it is certain that this number is held in great esteem by the Buddhists, especially those of the north: the *Kandjour* enumerates the 108 names of Manjucri, of Devī, &c., and we also find in the Mahābhārata the 108 names of the sun. The 68 signs of Burnouf may be brought to very nearly as many as 108; for, by counting the figures to which he gives but one number, but which, in Mr. Alabaster's plate, are each repeated a certain number of times, we arrive at the number 106, or even 107, if we add the central and principal sign, the *Çakra* (the wheel), which Mr. Alabaster does not count. Nevertheless this coincidence is more apparent than real. Several signs, mentioned by Burnouf, appear not to exist in Mr. Alabaster's drawing; he also divides the signs which Mr. Alabaster unites: thus the sun and the moon count for two signs in Burnouf's list, for a single sign in Mr. Alabaster's. Thus much may be inferred from these divergencies: the normal number is 108, and certain signs are found in all the drawings; but with regard to several, there exists a certain liberty; they may be added, or suppressed, or one may replace another.

To verify this conclusion, we ought to be sure that all the drawings of the Pra-Bat are alike; that, for example, that represented by the plate in Mr. Alabaster's book, and which is to be seen in a convent at Bangkok, is identical with "the Burmese foot-print now in the British Museum" (p. 289), and not only that the number of the signs is the same. The last word has not yet been said on the subject of the Pra-Bat, but Mr. Alabaster has advanced the question by furnishing as the basis of new studies a drawing, which, being made from a photograph, is perfectly reliable.

LÉON FEER.

### Intelligence.

The new edition of Delitzsch's *Genesis* is enriched by three excursus on points of Biblical geography from the competent pen of Consul Wetzstein. The writer identifies "Hobah, which is on the left hand of Damascus" (Gen. xiv. 15) with a fountain called Hōba near Karjetēn in the "land of Menāqir" (the district east of Hasiā and Hims). He also proves that Zoar was not on the peninsula which juts out into the Dead Sea from the east (as Robinson and others supposed), but on the south-east end of the lake in the Gor-e-Şāfia; and that Kadesh (Gen. xiv. 7) is not Ain Kudeis, which is too far to the westward, but Kādūs, a station on the southern caravan-road, between Hebron and Zoar. The last identification rests on the authority of the traveller Maḳdisi (tenth century), who was a native of Jerusalem, and lived before the pre-Islamic civilisation of Syria had been seriously injured. The second excursus should be compared with a paper by Dr. Grätz in the August number of his *Monatsschrift*, who arrives at the same conclusion as Dr. Wetzstein by a comparison of Biblical passages. He thinks that "the city of palm trees" (Judg. i. 16; iii. 13) is Zoar, which is actually called "villa palmarum," or Palmer, Paulmier, by the Christian writers of the Crusades. In Deut. xxxiv. 3, he assumes a transposition (cf. Gen. x. 14), the words "city of palm trees" being unnecessary and contrary to usage, if taken as an epithet of Jericho. The site of Zoar is defined by Deut. i. c. and Josh. xv. 2, 3; also by Ezek. xlvii. 10; xlviii. 28, where Tamar must be a place at the south end of the Dead Sea, and, as appears by a comparison of passages in Eusebius, is to be identified with Zoar. Two other identifications are proposed for the first time by Dr. Grätz, (1) that Shur = Geshur (?), and (2) that "the smooth mount which goes up towards Seir" (Josh. xi. 17; xii. 7) is the well-known salt-hill of the south-west end of the Dead Sea.—We notice that Consul Wetzstein pays a deserved compliment to Mr. E. H. Palmer for his exploration of the Negeb or "south country" of Palestine.

Dr. Paul Kleinert, Professor of Theology in Berlin, and well known as one of the contributors to Lange's *Bibelwerk*, is the author of a volume entitled *Das Deuteronomium und die Deuteronomiker*. His point of view in the present work is not apologetic but critical. His position as a critic, however, is isolated in the extreme (he is anticipated, it is true, by Stähelin), for while he fully admits that Deuteronomy *cannot* have been written in the age of Moses, he thinks it may still be in a sense Mosaic, as being a reproduction of ancient laws, some of which were committed to writing by Moses himself (p. 238). The compiler was probably Samuel, the second Moses of the Israelitish religion. After showing that the book of Deuteronomy is composed of a code (ch. v. to ch. xxvi.) and a historical setting, Dr. Kleinert discusses at some length the relation of this code to the middle books of the Pentateuch. The characteristics of the former differ widely from those of the latter, though not more so perhaps than may be accounted for by the different points of view from which the same subjects are regarded. Besides, points of contact between the two legislations are not wanting (p. 44). The following passages are shown to be pre-Deuteronomic, Ex. xx.-xxiii., xxxiv. 11-26, xix. 5 ff., xiii. 1-13, Lev. xvii. 8 ff., Num. xxxiii. 50 ff., iii. 12 ff.; also the principal directions in Lev. xviii.-xx., the contents of Ex. xii. 1-14, 21-23, 43-50, Lev. xiii., xiv.; and the following post-Deuteronomic, Lev. xi., xv. 16 ff., xvii. 15 ff., xxii. 17 ff., xxiii., xxv. 39 ff., xxvii. 26 ff., 30 ff., Num. xv. 37 ff., xviii. 15 ff., 21 ff., xxviii., xxix. An attempt is then made to show that there is little to be said for and much against referring Deuteronomy to the reign of Josiah; cp. the command to extirpate the Canaanites and Amalekites, the friendly mention of Edom and Egypt, &c. Thus the way is smoothed for the admission of an earlier date, not indeed in the age of Moses, for a complete social revolution must have intervened between the oldest extant laws and Deuteronomy (p. 128). The only date which suits the historical references is the conclusion of the period of the judges; cp. the mention of the elders of the city as judges; the law of the king; the worship of the sun and moon; and the idea of religious centralisation, though the religious centre itself is conceived as fluctuating—it is "the place which," from time to time through a prophet, "the Lord thy God shall choose." In the concluding dissertation it is shown that the historical passages which form the setting of the code give no reason for referring them to a different date. An appendix contains a most useful phraseological index, with the twofold object of ascertaining how far the style of Deuteronomy is uniform, and how far it has influenced that of other Old Testament books. On the whole, though Dr. Kleinert's work can hardly be called satisfactory, it will be valuable to the student from the completeness with which the *data* for forming an opinion are presented, and the clear historical summary of previous hypotheses in the introduction.

We understand that Messrs. Clark, of Edinburgh, intend to publish a supplement to the translation of Cremer's *Lexicon to the New Testament*, containing the additional matter inserted in the second edition of the German work (1871-72), together with corrections, &c.

### Contents of the Journals.

**Journal of the American Oriental Society** (No. 1 for 1872).—One of Mr. Burgon's many startling assertions in his work on *The Last Twelve Verses of the Gospel according to St. Mark* (see *Academy*, vol. ii. pp. 518, 519) is subjected to a searching examination by Mr. Ezra Abbot, a professor at Harvard University, and one of the contributors to the *North American Review*. In one of his concluding dissertations, Mr. Burgon has maintained that certain "notes of superior antiquity," which he specifies, "infinitely set Cod. B before Cod. N, though it may be impossible to determine whether by 50, by 75, or by 100 years" (p. 293). Prof. Abbot shows conclusively that Mr. Burgon's arguments on this head are frequently misleading, and due to a strange misapprehension of facts. He allows, however, that some new critical material is amassed in the body of the work, and that some special topics, as the so-called Ammonian sections, are discussed in a satisfactory manner. But "his conclusions are often strangely remote from his premises," and he writes "in the spirit of a passionate advocate, rather than that of a calm inquirer."

### Philosophy and Physical Science.

**Kant's Critical Philosophy for English Readers.** By J. P. Mahaffy, A.M. Vol. I. Part I. and Vol. III.

MR. MAHAFFY'S exposition of Kantism for English readers is very well planned, and (as far as can be judged from the instalment before us) satisfactorily executed. His work will consist, when complete, of three volumes; two containing an abridgment and explanation of the *Kritik*, together with some controversial matter; and the third consisting of a translation of the *Prolegomena*, together with some portions of the *Kritik*. The *Prolegomena* is more popularly written, and much better adapted to give the student a general grasp of Kant's aim, method, and results than the *Kritik*: and Mr. Lewes (*History of Philosophy*) recommends the English reader to begin with it. But many portions of it are not thoroughly intelligible without some knowledge of the earlier treatise: yet the prolix obscurity of this is calculated to repel even an earnest reader. In order to give a thorough grasp of the general features of Kant's system with the least possible waste of labour, we want a good popularisation of the *Kritik* to be read along with the *Prolegomena*: and this is just what Mr. Mahaffy proposes to give.

I have said that Mr. Mahaffy's execution of this scheme is adequate *as far as can be judged*: but he would be the first to allow the importance of this qualification. He has as yet only expounded the *Transcendental Aesthetik*: and this is precisely the portion of Kant's system which English readers have pretty well contrived to understand. Indeed Kantian views as to Time and Space have been avowed by some writers (e.g. Whewell) whose works show no sign of their having penetrated any further into Kantism. But I cannot mention one Englishman, even among the distinguished persons who have spoken of Kant with an air of thorough familiarity, who has given the least evidence that he really understood the *Transcendental Analytik*. Certainly neither in Hamilton's criticism of the Categories and Ideas (*Discussions*, pp. 16, 17) nor in Mansel's elaborate discussion of Substance and Causality (*Prolegomena Logica*, c. v.) is there

any such evidence. So that if Mr. Mahaffy succeeds in giving a really clear and intelligible exposition of this part of the *Kritik*, he may fairly claim to have achieved a work hitherto unattempted.

The commentary already published does not perhaps give much scope for the display of expository talent: in fact, it is more an abridgment, somewhat rearranged, than an exposition. But it is certainly easier to read than the original, merely because it is shorter: and both here and in the translation of the *Prolegomena* the English is clear and vigorous, and the rendering, so far as I have examined it, very exact. The slight licenses which Mr. Mahaffy has allowed himself (consisting chiefly in dismemberment of the most unwieldy sentences) are always used with good taste: and only in one case (vol. iii. p. 85) has the sense of the original suffered in the reconstruction. A list of the few passages in which Mr. Mahaffy's rendering has appeared objectionable is subjoined.\*

In the commentary, perhaps a little more explanation of Kant's special phraseology would be advantageous. For example a beginner needs some introduction to Kant's complicated and perplexing use of "object" and "objective." He can scarcely be expected to guess that "objective Gültigkeit" means no more than "nothwendige Allgemeingültigkeit," and hence that the same principle or element of cognition may be called "subjective" or "objective" according as we view it. I admit that it is very difficult to know when to explain a term, if such explanation involves the exposition of a doctrine. In one passage where Mr. Mahaffy attempts to explain by an example Kant's use of "Unconditioned," his accommodation to the beginner seems rather misleading. He says:—

"We cannot comprehend our mental phenomena without presupposing necessarily a substance called Mind, beyond and beneath all its various manifestations. This illustration will explain what Kant means by the necessary belief in the Unconditioned."

Now this certainly seems to confound the functions of the (Kantian) Reason and Understanding. What the Understanding necessarily adds to sense-phenomena in order to render them intelligible is the notion of Substance = somewhat perdurable. What the Reason seeks in the world of experience and cannot find there is Absolute Subject = somewhat that cannot be conceived as predicate. That the pre-Kantian metaphysic combined the two notions, and that it is a peculiarity of Kant's system to argue the illegitimacy of this combination, Mr. Mahaffy is of course aware: but if he had realised how very difficult it is for a beginner to seize and retain Kant's view on this point, he would hardly have used this illustration.

I proceed to notice some controversial points.

I. At the end of vol. iii. Mr. Mahaffy reprints his translation of suppressed passages in Kant's first edition of the *Kritik*; partly to justify his defence of Kant against the current charge of retracting in the second edition his original

\* Vol. i. p. 16.—"If our intuition must conform to the nature of its objects, how can we know anything *a priori* about these objects?" Kant says, "*von ihr*" = "about the intuition;" and the sequence of his argument requires this.

Vol. iii. p. 27.—"It must proceed beyond the concept to *that which contains the corresponding intuition*." Surely it must be "that which the corresponding intuition contains." The German is of course ambiguous.

P. 39.—"The mere natural, though *in spite of its truth* not unsuspected cognition *a priori* which lies at the basis of [Metaphysic]." Kant says, "obgleich wegen ihrer Wahrheit nicht unverdächtige." The metaphysical affirmation is natural, but its validity nevertheless suspected.

P. 85 (last line but one).—"So far" seems meant as a translation of "so ferne" (so far as), and is in any case confusing.

P. 115.—The second sentence seems curiously confused.

P. 150, l. 4.—"Intuition" seems a clerical error for "function."

In p. 122, "Gesetzmässigkeit" should be rendered "legitimacy" (and not "regularity"), as afterwards, p. 129.

I may add that in p. 155, l. 1, a "not" is omitted, where the omission may perhaps puzzle a beginner.

Idealism.\* I have no doubt that the charge is unfounded, and that the "Refutation of Idealism" (second edition) has been gravely misapprehended: but I cannot but think that the author himself is somewhat to blame for this misapprehension. It appears (compare *Prolegomena*, § 13, remark ii. with remark iii.) that there are two quite distinct grounds on which Kant is disposed to argue the difference between his system and Idealism (whether Berkeleian or Cartesian). First, that he allows the existence, *beyond experience*, of Things in themselves, causing, though not constituting, the matter of experience. Secondly, that *within experience* he gives no prerogative of certainty to the cognition of the Ego as an *empirical object*, compared with that of the Non-ego: rather he can demonstrate that the consciousness of my own existence in time involves and presupposes an immediate consciousness of the existence of material objects in space. Now Kant had a perfect right to call attention to these two points of difference: but it seems clear that (1) they have nothing to do with each other; (2) he exaggerates the importance of the first (for he does no more than substitute an  $\alpha$  for the God of Berkeleian Idealism); (3) he facilitates a confusion between the two by applying the same phrase, "things existing without us," both to the empirical and to the extra-empirical world.

II. Mr. Mahaffy thinks that he has effectually refuted the common error that Kant based the science of arithmetic on the intuition of Time (not Space). He says, with some *naïveté*, "Since the publication of my criticism on Kuno Fischer's *Commentary*, I think this position has tacitly been abandoned." It is time, then, to come to its support. We find in the *Prolegomena* (§ 10) that—"Geometry is based upon the pure intuition of space. Arithmetic accomplishes its concept of number by the successive addition of units in time." This seems sufficiently explicit: but Mr. Mahaffy only sees in it "a lurking doubt whether arithmetic may not be derived from time." He seems to rely for the opposite view on two passages in the *Kritik*: one in the Introduction (p. 10f), where Kant speaks of having "recourse to an intuition . . . our five fingers for example or . . . five points"; the other in c. i. of bk. ii. of the *Analytik*, where "five points placed one after another" are said to be "an image of the number five." But obviously here Kant is not separating *pure* from *mixed* intuition: he is merely indicating the common empirical examples to which we naturally refer in making evident to ourselves the principles of arithmetic: therefore *à fortiori* he has no occasion to specify the pure intuition which arithmetic requires. When he came to do this, he could not but specify Time, as the objects of the inner sense are numerable as well as those of the outer.

III. Mr. Mahaffy repeats (in the strongest terms) his assertion that Locke "completely anticipated" Kant's general division of Judgments. He refers to three of Locke's "kinds of agreement and disagreement between our ideas"—(1) Identity and Diversity, (2) Relation, (3) Co-existence: and says, "here are Kant's analytical, synthetical *à priori*, and synthetical *à posteriori* judgments accurately distinguished." It seems to me perfectly incomprehensible how any one who had read Locke's fourth book could make this assertion. First, Kant's analytical judgments do not correspond even roughly to Locke's affirmations of identity and diversity. These are only one species of what Locke calls "Trifling Propositions," which may more plausibly be

identified with Kant's Analytical Judgments; but even here the correspondence is very rough, because Locke would only call "trifling" those analytical judgments in which the analysis is so obvious that its statement is no gain to our knowledge. In fact, we find that he gives, under the head of Relation, propositions clearly (by his own account of them) analytical: *e.g.*—"where there is no property there is no injustice;" "no government allows absolute liberty" (bk. iv. c. iii. § 18). Secondly, Locke's distinction of Relation and Coexistence is in itself most unsatisfactory. It is not only, as he himself says, that coexistence is a kind of relation; it is also true that from one point of view all propositions affirm coexistence, *i.e.* logical coexistence of predicate with subject. It may be said that Locke means to restrict the term to the coexistence of attributes in a substance: and certainly his express examples are all of this kind. But in his original account of it he only says that "this belongs particularly to substances." And it is a curious illustration of the vagueness of his whole view that he actually analyses the same piece of intuitive knowledge—that the angles of a triangle are equal to two right angles—in two different ways, so that it must almost necessarily belong to two different classes. Compare c. i. § 2 and c. ii. § 2. In the latter passage the "agreement" is between the three angles of a triangle and two right ones, and is obviously an agreement of relation: in the former it is said to be between "*equality to two right ones*" and the three angles, and I do not see how Locke could have classified this except as an agreement of coexistence. But all this is unimportant beside the fact that the affirmations of coexistence with which Locke is chiefly concerned are synthetical *à priori*. How Mr. Mahaffy can have overlooked this, I cannot conceive (cf. c. iii. §§ 8–16 and c. vi. §§ 6–10). It is true that Locke says, and is indeed concerned to maintain, that there are "very few" such certain universal affirmations of coexistence: but he still allows that there are a few cases of primary qualities known to be necessarily coexistent, and more of "repugnancy to coexistence" cognisable *à priori*. Indeed, one may almost say that no better way could be found of proving to a beginner the difficulty and merit of discovering this classification of Kant's than a careful examination of Locke's fourth book.

IV. Nearly one-half of Mr. Mahaffy's first part is occupied with a polemic against the Empirical or Associationist theories of Space and mathematical truth, partly new and partly reprinted from the introduction to his translation of Fischer's *Kant*. It is probably desirable, in an English exposition of Kantism, to exhibit its relations to the mode of thought at present prevailing in England: but one cannot but wish that the treatment of the subject had been somewhat broader, with less tendency to resolve itself into a private wrangle with Messrs Mill and Bain. One wishes this the more because the view that our author combats, which I may call pure psychological associationism, already seems almost antiquated, owing to the extensive influence exercised of late years by the theory of Evolution through successive generations, of which Mr. Spencer is the leading expositor. Mr. Mahaffy's proposal to call his opponents "the physiological school" seems thus peculiarly infelicitous: since to most physiologists at the present time the older Empiricists appear to err as much in considering the mind as characterless at birth as the still older Transcendentalists did in considering it as transcendently characterized. However, his statement of the issue between Kantism and Associationism must be allowed to be fair, with one or two qualifications. First, he makes, as all Kantists, the assumption which to all but Kantists seems so baseless, that while the universal element in cognition is rightly referred to the

\* Mr. Mahaffy does not always bear in mind the difference of editions. *E.g.* he says (*Prolegomena*, p. 23) that a passage is "transcribed verbatim from the *Kritik* without a single explanation," whereas it only occurs in the second edition, into which it was transferred from the *Prolegomena*.

† I quote from Mr. Meiklejohn's translation. This passage is also in the *Prolegomena*.

mind, the particular, variable element *must* be due to foreign causes. He urges that the latter element cannot be changed at will by the mind: but then no more can the former. Our apprehension of things as extended is just as independent of our volition as our apprehension of them as coloured and heavy. Again, he claims that the Kantian theory is "not more complex" than the other, and is the only one which explains all the phenomena. His argument is that the Empiricists have to assume Memory and Expectation and the laws of association, and do not explain these: whereas Kant refers all association to the synthetical unity of apperception. But the elaborate apparatus of mental forms by which Kant is said to "explain" our experience does not become any simpler because these forms are, so to speak, strung on one thread and called modes of apperception. The different characteristics of cognition which are thus referred to different transcendental causes remain as separate and irreducible after as before the reference. Now the Associationists do at any rate attempt a certain reduction: they try for example to derive the "external sense" of Kant from the internal, and to exhibit Cause and Substance as results of different applications to phenomena of the same fundamental laws of association. Thirdly, our author forgets in dealing with Mr. Mill that the latter's exposition naturally faces not Kantism, but Common Sense: and so is encountered by the belief (which Kantism and Empiricism agree in rejecting) in the independent existence, apart from the mind, of Percepts, not Things in themselves. It is this that he calls a "belief in an external world," using that unhappily ambiguous term not in a spatial sense, but to signify "independent," "existing out of perception." Hence the charge that he neglects the "conviction that *present* objects are given as external" is beside the mark, as extra-perceptual existence does not come into question in respect of *present* objects of perception, considered as present.

This agreement between the two schools in restricting cognisable reality to the world of possible experience reduces the controversy about Space within manageable limits. The point at issue is merely the universality and necessity of a particular element of cognition. Still even this narrower question is found to resolve itself into two, of which the logical connection is somewhat disputable. The "necessity" of geometrical truth is commonly (and by our author) thought to be bound up with the "originality" of our apprehension of Space. But Mr. Mahaffy himself in a suggestive passage distinguishes "subjective" and "objective" necessity: and it is quite conceivable that the notion of Space may be a necessary element of our clear and matured cognition, and yet not have been possessed by the mind at first in its present form. Now the enquiry into the *nature* of the notion of Space is usually so mixed up with the enquiry into its origin that, when an Empiricist speaks of "analysing" the notion, it is not easy to say what sort of an operation he means: whether the analysis is introspective and immediate, disclosing the elements of which the notion is seen, on reflection, to consist: or whether it is a hypothetical process of reasoning by which the psychological antecedents of the notion in the remote past are conjectured. As I understand the Empiricists, they argue that the two processes lead to similar results and so support and confirm each other. Hence it is scarcely fair to describe Mr. Bain's assertion, that "the perception of space *means* muscular sensation," as "boldly begging the question": he is merely stating the results of his introspective analysis as an argument in favour of his hypothetical synthesis. If Mr. Mahaffy finds on reflection that *his* notion of Space, so far from resolving itself into muscular sensation, is not even inseparably associated with it, Mr. Bain's hypothetical

account of its origin naturally appears to be slenderly supported. Still, when he in his turn asserts that "it is matter of fact that the image on the retina of every eye is originally perceived as extended," he clearly goes beyond all possible evidence. An absolutely decisive experiment as to the state of an infant's consciousness can never be made. The best evidence we can collect is derived from the cases of those who, born blind, have acquired vision when grown up. One such case—Dr. Franz's—is given here at some length, and, as far as it goes, is clearly in Mr. Mahaffy's favour.

On the other question of the intuitive universality of mathematical judgments it is scarcely possible to say anything new: but one of our author's arguments deserves notice. Granted, he says, that we have had much general experience of things extended and numbered before we frame mathematical judgments, there is no evidence that we have definitely abstracted and attended to the precise notions which we conjoin in these judgments: or at any rate that we have done this with sufficient frequency to form the indissoluble link of association. This argument is strongest in the case of geometry: where the Empiricists admit and indeed earnestly maintain that the exact lines and circles to which our judgments relate have never been presented in experience. When Mr. Mill is forced to suggest that the empirical association which has given the appearance of necessity to these judgments has been "Induction by method of Concomitant Variations," one feels that this dexterous and persuasive reasoner must be very hard pressed.

H. SIDGWICK.

#### BASTIAN'S ETHNOLOGICAL COLLECTIONS.

1. *The Laws of Various Races.* [*Die Rechtsverhältnisse bei verschiedenen Völkern der Erde. Ein Beitrag zur vergleichenden Ethnologie.*] By Dr. A. Bastian. Berlin: 1872.
2. *Contributions to Ethnology and its Derivative Studies.* [*Beiträge zur Ethnologie und darauf begründete Studien.*] By Dr. A. Bastian. Berlin: 1871.
3. *Ethnological Investigations, &c.* [*Ethnologische Forschungen und Sammlung von Material für dieselben. Erster Band.*] By Dr. A. Bastian. Jena: 1871.

Few writers, living or dead, have done more than Professor Bastian of Berlin to convert the study of civilisation from a branch of speculative philosophy into a branch of positive science. To general students, however, his voluminous works are little known and almost inaccessible. His opinion is that ethnology is as yet only passing beyond the stage of accumulating and co-ordinating data, from which systematic theories are at some future day to be worked out. Thus his vast labours have been and still are so consistently carried on among the foundations of his science, that the literary public seldom even sees his head above ground. Dr. Bastian's most satisfactory ethnological publications, such as his great work, *Der Mensch in der Geschichte*, published in 1860, consist for the most part of masses of materials collected and grouped under their proper headings, with short introductions to acquaint the reader with the author's views as to each topic. Were the process carried a stage farther, by shaping these ideas and facts into a systematic whole, the book would become a standard treatise, instead of a mine of materials for the writers of standard treatises. But Dr. Bastian deliberately prefers to leave his work in its incomplete stage for others, sacrificing to the eventual prosperity of his science much of the personal fame which rewards a popular style and method. To those who use his volumes with profit, we would only suggest this caution, not too readily to consider as original their own

inferences from Bastian's collections of evidence. These inferences are often conveyed to their minds in some shrewd hint in the introductory paragraphs, or are latent in the very arrangement of the materials, which plainly suggest the general principle they prove and illustrate.

Dr. Bastian's new volume, *Die Rechtsverhältnisse bei verschiedenen Völkern der Erde*, is constructed on this principle. Its introduction starts with the doctrine that—

"the organization of man, in the character of a *ζῶν πολιτικόν*, arranges itself in political institutions, which, as the regular result of uniform existence, must ever come to light under the same principles, except in so far as regards variations in the characters of varieties arising from the different characters of ethnological provinces. Thus the physical organism of man, as based on specific unity, is throughout similar in all its vital organs, although displaying itself in manifold varieties within the range of different anthropological districts, and under the influence of different climates," &c.

Taking the thoughts and habits of mankind as reducible by classification to results of general laws, Dr. Bastian collects and examines evidence on numerous topics of social science, such as the institutions of chiefship, patriarchal and military, the laws of property, caste, marriage, slavery, commerce, &c. As examples of the value of evidence collected on this method, so as to display its inner meaning in its very collection, the following group (p. 185) may serve, which is in fact a compact little dissertation on the well-known custom of inheritance by the youngest son, referring it to an obvious natural cause, and showing it not to be limited to the Aryan race:—

"Bei den Tartaren erbt (nach du Halde) der Jüngste, der im Vaterhause zurückbleibt, während die Aeltern nach einander mit ihren Heerden fortgezogen und selbstständig geworden sind." "On trouve une pareille coutume en Bretagne dans le duché de Rohan, où elle a lieu pour les rotures." "Utdschigin (Feuerhüter) hiess der jüngste Sohn bei den Mongolen, als erbend." "Item, dass Inn der herrschaft Pfirtd gebrechlich das under den geschwisterigen und ehelicher geburt der jüngst son seines Vathers seligen hofreite oder behausung besitzt." "Le droit de Juveigneurie était général dans la Haute-Alsace (Bonvalot)." "C'était le plus jeune fils, qui héritait de la propriété paternelle dans le pays Grimbeghe en Brabant."

For an instance of the accompaniment of compiled facts with a theory to account for them, it may be mentioned that Dr. Bastian collects evidence as to that frequent but perplexing custom among savages and barbarians which prohibits parents-in-law from looking at or speaking to their children-in-law, and even compels them to go through an absurd pretence of not seeing one another. On this, he makes (p. 169) the suggestion (as to which we express no opinion except that it is ingenious) that the practice dates from an earlier state of the marriage-law, in which the wife was the property not of the individual husband, but of the family; so that under changed social conditions, the wife of the individual is practically secured in her rights, though formally her very existence is ignored.

Speaking in the name of ethnologists generally, we may venture to ask Dr. Bastian, in his future publications, to give not less but more liberally the theories and generalisations on which not merely their convenient use but their scientific value so much depends. In the *Beiträge* and the *Ethnologische Forschungen*, the absence of scheme, table of contents, and index, must make their matter only available to the few readers who will go through them for the purpose of extracting such passages as bear on their own particular lines of research.

EDWARD B. TYLOR.

#### Air and Rain: the Beginnings of a Chemical Climatology.

By R. Angus Smith, F.R.S. Longmans.

THIS work is the partial fulfilment of a task undertaken by Dr. Smith more than eight years ago; we say partial, because it consists of a reproduction of a number of separate

papers and notes, some of them published originally in the author's official reports, others read before various scientific bodies. It is more a collection of individual investigations than a scientific treatise exhibiting a definite plan, and the mutual connection of its several parts is far from clear. Thus we find under the heading of Rain a discussion of the determination of organic matter in the air, a problem which has nothing to do with rain. It is evident that the text-book of this important subject has yet to be written.

After saying thus much, we can bear full and free testimony to the value of what the author has given us, and the pains which he has taken to throw light on subjects hitherto so neglected, although of such vital interest to all. The general idea of air as taught in chemical text-books is that there is practically no appreciable difference in composition between the purest country air and the worst we find in towns, as the percentage differences as regards oxygen are all in the second decimal place. Almost all "open" air which Dr. Smith has tested contains 20.9 per cent. of oxygen; but in close confined places he finds considerably less, viz. 20.7 in the pit of a theatre, and even 18.27 in one mine specimen, the worst he has ever tested. Here then he takes his stand, and deals almost exclusively with these small quantities, which he makes more worthy of notice by quoting them as parts of a million. As he says:—

"Some people will probably enquire why we give attention to such minute quantities—between 29.980 and 29.999—thinking these small differences can in no way affect us. A little more or less oxygen might not affect us; but supposing its place occupied by hurtful matter, we must not look on the amount as too small. Subtracting .980 from .999, we have a difference of 190 in a million. In a gallon of water there are 70,000 grains; let us put into it an impurity at the rate of 190 in 1,000,000, it amounts to 13.3 grains in a gallon. This amount would be considered enormous if it consisted of putrefying matter, or any organic matter usually found in waters. But we drink only a comparatively small quantity of water, and the whole 13 grains would not be swallowed in a day, whereas we take into our lungs from 1000 to 2000 gallons of air daily."

The most important impurity is carbonic acid, and of its amounts in various places we have copious tables. From these we learn that when people speak of good ventilation in dwelling-houses, *they mean, without knowing it, air with not less than .07 per cent. of carbonic acid.* The mean amounts breathed ordinarily vary between 1.45, the average of several tunnels in the Metropolitan Railway, and .033, the proportion on the Scotch hills. It is not the carbonic acid in these small amounts which renders the air unpleasant to us. In towns it is no doubt sulphurous acid, but generally it is organic matter and gases arising from putrefaction, or from the ordinary processes of animal life. During a visit to a soda-water manufactory, the author found an atmosphere containing 0.19 of carbonic acid "very agreeable and not, at least in half an hour, to be distinguished from pure air." By other experiments in a closed lead chamber he had breathed much worse air than even this was, and as he says:—

"We are not yet able to say that 0.19 of carbonic acid caused no physiological effect; the absence of an effect which the sense of smell could detect did not hinder a very remarkable lowering of the pulse when air containing nearly 4 per cent. of carbonic acid was breathed. Here however a step is distinctly gained. We owe our discomfort to organic matter: although this has been said for years, it is not anywhere so fully proved as by the several facts now gained."

When we come to metalliferous mines, however, we find very different values for the composition of the air from that prevailing above ground. Thus, out of 339 analyses made by the author, the average was 20.26 per cent. of oxygen, thus showing a deficiency of 7390 in a million, and only *eleven per cent.* of the specimens could be called normal air.

"The state of these mines must exceed all that we who live above ground can comprehend. We enter gradually, and cannot very well

judge : if we leapt from the pure air into a close end in an instant, we should recoil with horror."

We next have a theoretical calculation of what the real composition of mine atmosphere must be, supposing a given amount of powder to be burnt in the day, followed by a notice of the microscopical examination of the solid contents of the air, most of which are crystals of nitre, &c. from the powder.

Among the most interesting portions of the book is the account of the personal experiments made in a closed lead chamber.

"After staying in the chamber for 100 minutes, the air had an unpleasant flavour or smell, and I came out : three persons entered at once, and pronounced it very bad ; I entered after a minute, and found it extremely bad. It seemed to me, however, that we are frequently exposed to air equally bad, although I have not found any daily life so much deprived of its oxygen as this must have been—reduced, that is, to 20 per cent."

After an experiment on the combustion of candles, Dr. Smith says :—

"We entered with candles and a spirit lamp. The lights were soon extinguished, and it was found impossible to rekindle them with matches : wooden matches were used, they refused to ignite. Still we breathed without difficulty at first, but a gradual feeling of discomfort appeared, of a kind which is not easily described : it was restlessness and anxiety without pain, whilst the breathing increased in rapidity. Afterwards gas was lighted, and it burnt with brilliancy."

They stayed in the chamber till the gas went out, when a feeling of faintness came on ; beyond this, and a feeling of closeness, nothing detrimental could be detected by the senses. A specimen of the air taken a few seconds after the door was opened contained 17.45 per cent. of oxygen.

Dr. Smith speaks of the constant struggle between our requirements of warmth and of ventilation, showing how putrefaction goes on but slowly up to 54°, then a sudden change is noticed, and it proceeds exactly as the temperature rises, not ceasing at a little above 130°. According as the temperature rises within any limits natural to this country, the necessity for ventilation is felt.

"It is therefore not right to demand as much air for ventilation on a cold day as a warm. The chemical action, and with it the feelings, demand warmth first above all things. It is the very first thing, and no function can go on without it. You may live for hours, days, or years, in badly ventilated places with more or less discomfort and danger ; but a draught of cold air may kill you like a sword, almost instantly."

We can only allude here to the author's proposed method of "minimetric analyses," viz.—the testing air by shaking it in a bottle with lime-water, and remembering the character of the precipitate formed, but he gives a very practical and useful rule.

"Let us keep our rooms so that the air gives no precipitate when a 10½ oz. bottle full is shaken with half an ounce of clear lime-water."

The second portion of the work has reference to rain, and it is chiefly made up of tabular matter, introduced with very little discussion. The author treats of the general characteristics of rain, as given in the "Alkali Report for 1868," and justifies his views by 109 tables of analyses of rain, principally from the United Kingdom ; the first few of these tables do not give absolute amounts, but are comparative only, some one locality, in several instances Valencia, as a typical sea-coast place, being taken as the unit.

The rain from the sea contains chiefly common salt, but that this does not arise from spray is shown by the fact that it contains a larger proportion of sulphates to chlorides than is found in sea-water. Sulphates increase inland, and rise very high in large towns, and when the sulphuric acid increases more rapidly than the ammonia, the air becomes acid. Free acid is always traceable to combustion or manufacturing processes ; but as in manufacturing districts the

chlorides and sulphates may become neutral, acidity of itself is not a safe test.

The plates of crystals obtained by the evaporation of rain-water are very interesting. London rain leaves a mass of needle-shaped crystals which yield chloride of ammonium by sublimation. Manchester shows similar needles with the addition of coal dust, oxide of iron, and organic matter. Newcastle rain gives crystals of Glauber's salt, and rain from the west coast of Scotland common salt. Of course these results are not strictly comparative, as the degree of concentration of the solutions is not uniform.

The results obtained by the analysis of air led Dr. Smith to adopt an artificial method of collecting the impurities of the air by means of water. This is what he calls "air-washing." He fills a bottle containing a little pure water with the air to be examined, and shakes it. By this means he collects all the foreign bodies in the air, and can accumulate a sufficient quantity for examination by repeating the operation with fresh bottlefuls of air. This then is a most practical and useful process for all sanitary inspectors, as it is so simple, requiring hardly any apparatus. The results are extremely satisfactory, showing very considerable accordance with each other when the operation is repeated under similar conditions.

The book concludes with a number of short notes on various points discussed in the body of the work, and some remarks on smoke and ventilation. The former of these are out of place, as they clash with some of his earlier statements—a natural defect, and one almost unavoidable when so busy a man as Dr. Smith puts the results of his current labours into the form of a text-book. R. H. SCOTT.

## Notes of Scientific Work.

### Physics.

**The Colour of the Metals.**—The rays thrown off from a coloured object are mixed more or less with white rays, because the light illuminating the object is incompletely decomposed. The colour of a brightly polished metallic surface is usually invisible, because the coloration due to decomposed light is disguised by the more powerful reflected light. As moreover attempts to develop the actual colour of a metallic surface by reflecting white light a great many times from it fail through the loss of the coloured light by dispersion, Seeley has proposed a modification of the experiment. As, when white light is decomposed, the reflected coloured ray is complementary to that which is transmitted or absorbed, he recommends the examination of solutions of metals in a fluid that is without chemical action on them. For the alkaline metals he used dry liquid ammonia, in which they slowly dissolve, forming a solution that appears blue by transmitted light ; and he concludes therefore that the colour of these metals by reflected light is red like copper. (*Der Naturforscher*, No. 36, 289.)

It is announced in the *Journal de Sicile* that Donati has constructed a spectroscopie of twenty-five prisms, which shows only the line C and a small portion of the red on either side of the line. This instrument, which enabled him to detect the line C on the centre of a solar spot, will be used for examining not only the protuberances of the edge, but more particularly those on the disc of the sun.

**The Ultra-Violet Rays of the Spectrum.**—Though under ordinary conditions only the portion of the spectrum which lies between A and H is visible to the eye, it has been found by Sekulić that the rays beyond the violet are distinctly seen if direct sunlight be allowed to fall upon the prism. Fraunhofer's lines as far as the N group make their appearance, and the M group comes out so clearly that its third broad line can be easily covered with the wire of the telescope. The N group is somewhat indistinct, only the bright bands being identified. The colour of this light is pale-blue or silver-gray. When examined with blue glass, this portion of the spectrum resembles a pale-blue vapour, at the background of which lie the dark lines ; by using a violet glass, it appears as a silver-gray band with the lines on a completely dark field. The lines of this very refrangible portion of the spectrum agree most completely with those of the photographic spectrum given in Müller's *Lehrbuch der Physik*. (*Archives des Sciences*, No. 175, 237.)

**The Generation of Electricity by a Current of Water.**—Zöllner has ascribed the production of the electric currents of the earth to the

incandescent molten masses in motion beneath the crust which generate currents in the direction of their own motion; and he has expressed the opinion that all current-movements of fluids, especially when in contact with solid bodies, are to some extent accompanied with currents of electricity that have the same direction as the fluids themselves. Zöllner inserted the ends of the copper wires of a very delicate galvanometer of Sauerwald just within the wall of a caoutchouc tube conveying a stream of water, and observed a deflection of several degrees of the scale, thereby indicating the existence of a current whose direction is that of the water. The greater the distance between the ends of the wires—which, by the way, need not be exposed to the force of the current, but may be replaced by metallic plates lying against the wall of the tube—the stronger the deflection of the needle. While recently repeating Zöllner's experiments, Beetz obtained (*Poggendorff's Annalen*, No. 7, 486) similar results, but found that the currents have a much simpler origin. The needle is deflected so long as the reservoir in which the water falls is not isolated. The metal tap, the stream of water, and the reservoir, in fact, form a voltaic element (brass, water, lead) whose current it is which deflects the needle. By filling the reservoir, and dipping the free end of the tube, also filled, into it, the current is observed though the water be shut off, nor does any change take place when the tap is opened. By simply inverting the position of the tube, the direction of the current is reversed; this is observed to be the case with or without a flow of water. If the reservoir be isolated, no current is formed; this is so whether the water be allowed to flow or not. When tap and reservoir are of zinc, no current is produced with or without a flow of water, and with or without isolation of the reservoir. According to Beetz's observations, then, no electricity is generated by a stream of water.

**The Susceptibility of the Eye to Variations in Intensity of Colour.**—The human eye, it is found, is over a considerably wide range susceptible to changes of brilliancy of white light, when the differences are equal fractional parts of the total luminous effect. Experiment has shown that on an average a change of one-hundredth of the total luminous effect, or even under favourable circumstances from  $\frac{1}{100}$ th to  $\frac{1}{100}$ th, can be recognised. Dobrowolsky has experimented with the various colours of the spectrum (*Der Naturforscher*, No. 24, 193), and determined the limit of susceptibility of the eye to changes of brilliancy in each instance. He finds it to be for red, at A  $\frac{1}{10}$ , at B  $\frac{1}{107.5}$ , and at C  $\frac{1}{25.16}$ ; for orange, between C and D,  $\frac{1}{25.16}$ ; for golden yellow, at D,  $\frac{1}{45.77}$ ; for green, between D and E,  $\frac{1}{45.77}$ ; for bluish-green, between E and  $\delta$ ,  $\frac{1}{67.33}$ ; for cyanogen-blue, at F,  $\frac{1}{131.9}$ ; for indigo, near G,  $\frac{1}{131.9}$ ; and for violet, between G and H,  $\frac{1}{131.9}$ , and at H,  $\frac{1}{67.33}$ , at which point the intensity of the light fails. These numbers show that the susceptibility of the eye to these changes of brilliancy increases continuously as we pass from red to violet, being in the case of the latter colour from ten to twenty times what it is with the red. These observations agree with what has been noticed by Helmholtz, that by a proportional decrease of illumination of brilliantly coloured surfaces the red fades from sight more rapidly and sooner than the blue.

**Conversion of Vis Viva into Heat.**—It is well known that a fall of temperature is recorded when a current of compressed air is driven against the face of a thermo-pile. Volpicelli (*Poggendorff's Annalen*, No. 6, 305), on allowing air which had been cooled to the ordinary temperature to escape from a pressure of four atmospheres against a thermo-pile, noticed three effects. When the nozzle was near the pile, a rise of temperature was remarked; when it was removed to some distance, a fall of temperature was observed; and when it occupied an intermediate position, the needle remained motionless. The causes of these variations of temperature are of three kinds: one arises from the destruction of the vis viva of the air; a second is brought about by the condensation of the molecules of air in the pores of the metal of the pile; and a third is due to the expansion of the molecules during their passage. The first two causes produce a rise, the third a fall of temperature. The movement of the needle will show whether the first two causes of variation are greater, equal to, or less than the third. Volpicelli's observations accord with those already described by Tyndall in his lectures on Heat.

**Thermo-electric Characters of Crystals.**—H. Hankel has made an examination (*Der Naturforscher*, No. 22, 177) of the nature of the electricity developed in crystals, especially in topaz, by a rise or fall of temperature, and has arrived at the following conclusions: 1. The thermo-electricity of a crystal is not directly due to hemimorphism, but appears to be a property of all crystals where other physical characters favour its development and accumulation. 2. As in crystals that are not hemimorphous the terminations of one and the same axis are crystallographically similar, these crystals have similar electrical characters, or, in other words, exhibit the same polarity, provided their development is actually the same. 3. The distribution of electricity on crystals that are not hemimorphous depends not alone on their molecular structure, but also on exterior form, and may by any change occurring thereon undergo modification. 4. As hemimorphism is to

be regarded as an exceptional case in crystallography, the development of opposite electricities at the two ends of the axis, a direct result of hemimorphic structure, is likewise exceptional. An alteration of the outer form of hemimorphic crystals appears to cause no quantitative change in the distribution of electricity, which appears therefore to be materially conditioned by want of symmetry in the molecule.

#### Development of Heat by Friction of Liquids with Solid Bodies.

—O. Maschke (*Pogg. Annalen*, No. 7, 431) has carefully investigated the rise of temperature which is observed when amorphous silicic acid is moistened with water and other liquids. Of his results a few require mention. Amorphous silicic acid which had been moistened with water, and so far dried that it had the appearance of porcelain, and contained 39.8 per cent. of water, showed a rise in temperature from  $15^{\circ}\text{C}$ . to  $16^{\circ}.5$ ; silicic acid,  $\text{H}_2\text{Si}_2\text{O}_5$ , rose from  $15^{\circ}$  to  $21^{\circ}.5$ . Silica which had been strongly heated and afterwards exposed to a very damp atmosphere rose from  $19^{\circ}$  to  $22^{\circ}$ . Silica which had been strongly heated and allowed to cool over sulphuric acid rose from  $16^{\circ}$  to  $23^{\circ}.8$  when water was added; another portion of the substance moistened with benzol rose from  $19^{\circ}.7$  to  $24^{\circ}.5$ ; a further quantity treated with oil of almonds showed a rise from  $20^{\circ}.5$  to  $26^{\circ}.5$ ; and a fourth portion moistened with sulphuric acid of the specific gravity 1.841 rose from  $19^{\circ}.2$  to  $33^{\circ}.5$ . About 20 grammes were taken in each case, and the bulb of the thermometer was placed in the centre of the powder. Glass and quartz reduced to a similarly fine state of division, on being moistened with water, showed no rise of temperature that could be detected by the ordinary means.

**The Heat Spectra of Sunlight and the Limelight.**—In an elaborate paper on this subject by S. Lamansky in *Pogg. Annalen*, No. 6, 200, the author, on comparing the position of the maxima of heat-effect in the two spectra obtained from flint-glass prisms, finds that the source of less heat-intensity attains a maximum heat-effect in rays of greater wave-length than is the case with the more powerful source of heat. He determined the absorptive powers of water, glass, mica, calcite, quartz, &c., and established the truth in each instance of what Melloni had previously observed with water: that the ultra-red rays on their passage through transparent substances suffer a loss which increases as the refrangibility of the rays themselves diminishes.

**Explosions in Flour Mills.**—An interesting article in *The Engineer* of 30th August, p. 145, having this heading, gives the results of an enquiry conducted by Professor Rankine and Dr. Macadam on behalf of the fire insurance offices into the circumstances which probably led to the explosion at the Tradeston Flour Mills, near Glasgow, in July last. The primary cause of the explosion was the accidental stoppage of the feed of a pair of stones, which led to their becoming heated and striking fire. This inflamed the finely divided dust diffused through the air of the exhaust conduits, the fire passing on to the exhaust box. The sudden ignition of the extremely inflammable dust diffused through the air would produce a very high temperature, and would necessarily be accompanied by a gust and sudden increase, in pressure and bulk, of the gaseous products of the combustion. The effect of this explosion was to burst the exhaust box, and allow a diffusion of dust and flame through the mill. A second explosion was the consequence, and the mill was reduced to ruins. The authors determined by direct experiment the interesting fact that this mixture of air and dust, when in the proportion best suited by theory to cause an explosion, produces, by being fired in a limited space, a pressure of eight atmospheres.

#### Geology.

**Fossil Vertebrates from the Niobrara and Upper Missouri.**—Prof. Leidy has founded a species of lion, *Felis augustus*, on several teeth and fragments of jaws discovered by Dr. Hayden at the Loup Fork of the Niobrara, Nebraska. The most characteristic specimen is an upper sectional molar about as large as that of the Bengal tiger. He also describes one of the caudal vertebrae of an animal related to *Plesiosaurus* and *Discosaurus*; and regarding the specimen as probably representing a genus different from those mentioned, he proposes for the species the name *Oligosimus grandævus*. Another specimen obtained by Dr. Hayden in the "Black Foot country," at the head of the Missouri, has the appearance of having formed part of the dermal armour of a huge saurian, or possibly of an animal allied to the armadillo. Accompanying this specimen is a distal phalanx, which may belong to the same species, named *Tylosteus ornatus*. (*Proc. Acad. Nat. Sc. Philad.* April.)

**A New Arachnid from the Coal-measures of Lancashire.**—In the *Geological Magazine* for September, p. 385, Mr. H. Woodward gives a description of a new species of *Arachnid* found in the clay-ironstone nodules of the Lancashire Coal-measures, which is remarkable for the close relationship it bears to a species of arachnid, *Architarbus rotundatus*, Scudder, from the Coal-measures of Grundy Co., Illinois. It is interesting to note how many of the old forms of life from the Carboniferous series of North America occur also with us, under similar conditions of fossilisation, in the clay-ironstone nodules of the Coal-

measures. Mr. Woodward proposes for this new species the name of *Architarbus sub-ovalis*.

**The Divisions of the Chalk Formation.**—At the last meeting of the British Association, Prof. E. Hébert proposed a new classification of this formation, which will embrace the deposits on both sides of the Channel. He names each bed after a characteristic fossil, and taking the Gault as the natural base of the Chalk, classes the overlying beds, in ascending order, as follow:—1. *Craie glauconieuse* (Upper Greensand and Grey Chalk); 2. *Craie à Inoceramus labiatus* (Chalk marl, chalk without flints, and part of the chalk with flints); 3. *Craie à Micraster cor-testudinarius* (part of the chalk with flints); 4. *Craie à Micraster cor-angulum* (chalk with flints); 5. *Craie à Belemnites mucronata* (Norwich chalk). Between the first and second divisions come the Sandstones of the Maine, and between the second and third division lies the Hippurite limestone. For a series of papers on the classification of the cretaceous rocks according to all the various leading geologists, compiled with great care and labour by Mr. Davidson, see *Geol. Mag.* 1869, vol. vi. pp. 162, 199, 251, 300.

**The Primordial Group of Canada.**—The St. John's, or Primordial, bed, the most interesting of all the formations originally recognised as distinguished from the adjacent beds by Mr. Matthew, was first proved to be Primordial by Prof. C. F. Hartt. His discoveries with regard to the fossils, added to those previously obtained, enabled him to announce this conclusion with full confidence, the species of *Lingula*, *Paradoxides*, *Agnostus*, *Conoccephalites*, *Obolellae*, &c. placing it beyond doubt. The formation mainly consists of shales, and is stated to be over 2000 feet in thickness. It occurs in southern New Brunswick, in the depression extending from the city of St. John by way of the Loch Lomond lakes to Hammond river, in the valley of the Kennebecas and St. John's rivers, in St. John's and Northern King's counties, and perhaps also in the Nerepis valley, as well as at some other points. The strata of these districts are described in detail in the Report of Progress for 1870-71 of the Geological Survey of Canada.

**Trachyte-porphry of Antrim.**—At the last meeting of the British Association, Prof. E. Hull read a paper on the trachyte-porphries of the north of Ireland and the county of Antrim, which constitute a group of eminences about four miles to the north of the town of Antrim. The tops of these hills are formed of basalt capping the trachyte rocks, and it is supposed that basalt covers in the whole of the trachytic area; as the survey of the district is incomplete, the actual limits have not been determined in every direction. The rock consists generally of a nearly white or grey felspathic base, with individual crystals of sanidine, a tridinic feldspar, grains of smoked quartz, and rarely a little mica. In some places the granules of silica are exceedingly abundant, giving the rock the appearance of rhyolite or perlyte as described by v. Cotta, and minute crystalline grains of magnetite are seen in a microscopic section. It is in this form that the iron found by analysis probably occurs. No passage or gradation between the basalts and the trachytes is met with, and as each has been erupted and spread out in sheets, they exhibit a laminated or bedded structure, which enables the observer to determine their relative positions without much difficulty. At several points the trachytic porphyry is observed to dip beneath the basaltic rocks of the neighbourhood; and observations on its direction tend to show that the trachyte is the older.

**Researches on Fossil Crustacea.**—Mr. Henry Woodward stated, in the sixth report of the committee for the prosecution of these researches presented to the last meeting of the British Association, that since last year he had completed his monograph on the Eurypterida, that on the Xiphosura alone being required to make the history of the Merostomata complete, four 4to parts on this order, comprising 180 pages and 30 plates, having already been printed by the Palaeontographical Society. Mr. Woodward gives some interesting information on the branchiae of *Ceratiocaris*, and descriptions of three new forms of Phyllopods from Dumfries; two *Limuli* from the Coal-measures named *Prestwichia Birtwelli* and *Bellinurus Konigianus*; a new Cape trilobite (*Encrinurus cristagalli*) from the Cock's Comb Mountains, S. Africa; a new British arachnid (*Architarbus subovalis*) from the Coal-measures; some new shore-crabs from the Lower Eocene, Portsmouth; and a series of Miocene Crustacea from Malta. Mr. Woodward controverted the views of Haeckel and Dohrn respecting the systematic position of the Merostomata among the Arthropoda, and contended that they should for the present be retained as an order of the class Crustacea; he illustrated their range, and that of the entire sub-kingdom of Arthropoda, by a diagram exhibiting the first appearance of Myriapods, Insects, Arachnides, and Crustacea, in geological time.

#### Botany.

**Formation of Ozone by Plants.**—C. Belucci has contributed to the *Gazzetta chimica italiana* (i. 687) a note on this subject. The experiments of Scoutetten, Bineau, Kosmann, and De Luca produced results which led those observers to infer that plants are sources of ozone; Cloëz, on the contrary, appeared to show conclusively that the ozone was due to other causes. He passed the gaseous products from

the plants through two tubes ranged side by side, and containing the iodized test paper; in one of these, which was exposed to the action of light, the test paper became coloured, while in the other, which was screened from the light, it remained unaltered, thus indicating that the action was due, not to ozone evolved from the plants, but to the effects of moisture, oxygen, and light on the test paper. The author has carefully repeated the experiments of Cloëz, and has devised new ones, in one of which he introduced into a large Wolfe's bottle of water saturated with carbonic acid, and containing a small quantity of potassium iodide and starch, sprigs and leaves of the following plants:—*Taxus baccata*, *Juniperus virginiana*, *Abies vulgaris*, *Thuja orientalis*, *Prunus Lauro-cerasus*, *Buxus sempervirens*, and *Chara foetida*. The apparatus was then placed in bright sunshine, but no change of colour was observed in the liquid, thereby proving that the green parts of plants do not evolve ozone under the influence of the solar rays.

**Remarkable Elastic Force of Capsules.**—At a recent meeting of the Academy of Natural Sciences of Philadelphia, Mr. Thomas Meehan stated that, while travelling through a wood, he had been struck in the face by some seeds of *Hamamelis virginica*, the common witch-hazel of the United States. He gathered a quantity of the capsules of this plant in order to ascertain the cause of the projecting power and to measure its force. Laying the capsules on the floor, he found the seeds were thrown generally from four to six feet, and in one instance as much as twelve feet. The cause of this immense projecting power he found to be due simply to the contraction of the horny albumen which surrounds the embryo. The seeds are oval, and are enclosed in a smooth bony envelope; and when the albumen has burst and expanded sufficiently to get just beyond the middle where the embryo narrows again, the contraction of the albumen causes the embryo to slip out with force, just as we should squeeze out a smooth tapering stone between the finger and thumb.

**The Decomposition of Carbonic Acid by Plants in Coloured Light.**—Prillieux and Baranetzky have maintained that the power of plants to break up this gas is dependent, not on the colour of the light to which they are exposed, but on the degree of its brilliancy. The incorrectness of this theory has been established by Sachs and Pfeffer, and a recent paper by the latter observer read before the *Gesellschaft zur Beförderung der gesammten Naturwissenschaften in Marburg* (*Botan. Zeitung*, Nos. 23 and 25), gives the results of his experiments on this question. He exposed a water-plant in turn to the several parts of a very brilliant and extended spectrum, formed of concentrated solar light, and observed the number of bubbles of gas given off from the surface in a given time; from his results he drew up the following table:—

Red . . . . .	25'4	Blue . . . . .	22'1
Orange . . . . .	63'0	Indigo . . . . .	13'5
Yellow . . . . .	100'0	Violet . . . . .	7'1
Green . . . . .	37'9		

**The Silicium of Plants.**—Recent researches have demonstrated the great analogy, in respect to chemical character, which exists between carbon and silicium. Though the presence of silicic acid in the ash of plants has hitherto been regarded as a proof of the existence of this substance as such in the living plant, it can no longer be denied that a portion of that silica may be due to the combustion of organic compounds containing silicium. In the present state of vegetable physiology, such a hypothesis cannot but meet with approval, for, on the one hand, no explanation has yet been offered of the function of silica in plants, while on the other it is known that certain plants can develop and thrive when deprived of silicium. If the chemist should show that silicium can replace carbon in plant-structure, much light will be thrown on this subject. A communication by A. Ladenburg (*Ber. Deut. Chem. Gesell. Berlin*, No. 12, 568) on this point requires notice, not that he has found a solution, but because he shows the direction in which it must be sought for. He first endeavoured to ascertain if a small, but constantly occurring, percentage of silicium in cellulose could not be ascribed to a silicium-cellulose or a similar body. After impure cellulose had been treated with nitric acid and potash successively, it left an ash containing 40 per cent. of silica. Pure cellulose, in the form of Swedish filter paper, which had been dissolved in copper-ammonia solution and precipitated with hydrochloric acid, left from 0'11 to 0'16 per cent. of ash, one-third of which was silica; the remaining two-thirds, however, being bases, leaves the matter doubtful. He next operated on *Equisetum arvense*, a plant containing 20 per cent. of ash, one-fourth of which is silica. After treatment with strong acid and potash, the amount of ash fell to 16 per cent., of which one-tenth is silica. In testing for a carburetted silica, analogous to silico-propionic acid, in the alkaline extract he obtained a body consisting chiefly of pure silicic acid, which on combustion gave 0'1 per cent. of carbonic acid.

### Philology.

**The Development of Latin Word Formation.** [*Die Entwicklung der Lateinischen Formenbildung.* Von Dr. H. Merguet.] Berlin: Borntraeger, 1870.

**The Derivation of Verbal Endings from Auxiliary Verbs.** [*Die Ableitung der Verbalendungen aus Hilfsverben und die Entstehung der Lateinischen e-Declination.* Von demselben.] Berlin: 1871.

THE treatise of which the title stands first at the head of this article is an attempt to account for the origin and trace the development of the known phenomena of Latin grammatical formation. For his facts the author seems to have drawn chiefly upon Neue, Corssen, and Schuchardt, nor does he make any profession of independent research in this direction: the speculative portion of the book, so to speak, is therefore the most important, as being evidently that on which the writer has spent most of his pains and ingenuity. As several of his conclusions are seriously at variance with the views hitherto commonly received by Latin philologists, the book appears to have provoked a good deal of adverse criticism; and the tract of which the title stands second is a reply to the objections raised by various scholars (notably Corssen and G. Curtius) against some of the author's theories, especially his theories of the *e* or fifth declension, and of the part played (according to common opinion) by auxiliary verbs in forming Latin tenses.

Let us take the question of the *e* declension first, as Dr. Merguet's treatment of this point is fairly typical of his whole method. "Its origin was," he says (p. 27), "as follows: From the feminine stems in *-ia*, belonging to the first declension, there branched off collateral forms in *-ies*. In some cases *-ia* remained the most usual form, in others *-ies* was preferred and *-ia* given up; in the latter case the *i* was consequently lost, and finally altogether suppressed through the influence of the accent" (*fames*, *fides*, *plebes* standing for *famies*, *fidies*, *plebies*); "in other instances it was sometimes preserved (e.g. *rabies*), in others partly preserved and partly suppressed" (*faces* being an old form attested by Paullus, perhaps for *facies*). "Subsequently this declension was swelled by such polysyllabic consonantal stems as, after dropping their characteristic consonant, still ended in *-ie* (*quies*, *dies*), and the monosyllabic stems which by this means preserved the *e* of their solitary syllable."

The assumption here made that words in *-ies* formed the original stock of the fifth declension seems somewhat arbitrary, especially as the great majority of words with that termination consists of the names of abstractions (*seignities*, &c.) and obviously late formations. As for *fames*, *fides*, and *plebes*, it cannot be said to be anything like certain that they originally ended in *-ies*; nor can the obscure sentence of Paullus about *faces*, "*faces antiqui dicebant ut fides*," be said to yield more than problematical evidence about a collateral form of *facies*. The monosyllables *res* and *spes* have as good a right as any words in *-ies* to be considered as originally belonging to the *e* declension. As for *dies*, there is really nothing to show that its stem was not *die-*: *diur-nus*, to which those who take a different view appeal, has always seemed to us to be most simply derived from the ablative *diu*. The simplest way of dealing with this puzzling set of nouns seems to be to avoid the theory of mutual transitions from declension to declension, except in the few cases in which such a process can be certainly proved, and to assume the existence of two sets of stems, one in *-e* and the other in *-es*, the first of which formed the fifth and the last part of the third declension. If this hypothesis be correct, the *-s* in genuine fifth-declension words, such as *res*, *dies*, and (according to one declension) *spes*, would belong not to the stem, but to the nominative ending; if it be incorrect, and *res* (for instance) be a complete stem, why do we not have *reribus* instead of *rebus* in the dative and ablative plural? *Spes*, it is true, shows a nominative plural *speser* as well as *spes*, and *spes-are* is its derivative: on the other hand, it also shows forms belonging to the fifth declension, and its diminutive is not *spes-i-cula*, but *spe-cula*. No evidence can be produced to show which form of the stem is the oldest; but analogy may be fairly said to be in favour of the form in *e*. Why the *e* stems retained the *s* of the nominative while the *a* stems dropped it, is difficult to say, nor do we think that Dr. Merguet has solved the problem: perhaps a bare *e* would have been too indefinite an ending, to say nothing of its liability to confusion with the short final *e* of neuters such as *rellē*, &c.

With regard to the third-declension nouns in *-ēs* and *-īs*, Bopp appears to be right in considering them to belong to a class corresponding to the Greek nouns in *-ης*, genitive *-εος*: a hypothesis which Dr. Merguet declines to admit. This class in Greek forms the masculine and feminine complements to neuters in *-ος* or *-εος*: compare *Μεγακλής* with *κλέος*, *εὐγενής* with *γένεος*, and the like. Thus *nubes* may perhaps be taken as a feminine corresponding to the neuter *νέφος*. In Greek the oblique cases of both genders are formed alike, and this is the case in a few instances in Latin: compare *pulvis* (the original quantity), *pulveris*; *vis*, *vires* with *genus*, *generis*: the change of the *s* in the stem to *r* in Latin corresponding here, as so often, to its omission in Greek (*γένε-(σ)ος*, κτλ.). Between the *-ēs* of the consonant and that of the vowel declension, however, there easily arose a confusion, shown already in genitives like *dies* and uniformly in the nominative plural. Thus, without any attempt at regular filiation, we may explain the variation of declension in *spes* and other words that exhibit it. The Latin language has in general a tendency to reduce similar forms to one type; and the confusion, or tendency to unification, noticed here may be compared with that which took place between the verbs with *ē* and those with consonant or *ē* stems.

In his account of the genitive of the first declension, Dr. Merguet, if we rightly understand him, is not consistent. He says (p. 70) that *Prosepnais* (C. I. L. i. 57) is the only instance of the full ending of this case; that the genitives in *-as* (*familias*, &c.) are abbreviations of it, but that in later

forms of its development the *i* appeared again. Does this mean that the genitive in *-ai*, *-ae*, is an abbreviation of the genitive in *-ais*, *-aes*? If so, it is difficult to reconcile this page with page 81, where we understand Dr. Merguet to contend that the genitive in *-ai*, *-ae*, is identical with the locative.

Coming to the pronouns, we find that Dr. Merguet considers *qui* to be a secondary form of *quis* (pp. 155, 156): a hypothesis which seems to us in the highest degree improbable. On reading over carefully all that Dr. Merguet has to urge both in his main treatise and in his reply to his critics, we are still of opinion that the hypothesis of the older philologists was right, and that *qui* and *quis* are separate stems. There is, first, the exceeding unlikelihood of the *i* of *quis* being lengthened; secondly, the patent fact that *qui* shows almost throughout an *o* stem, with or without the addition of *i* (compare also the conjunction *quom* or *cum* and the adverb *quo-t*), while *quis* and *quid* as obviously show an *i* stem. *Quem* and *quibus* seem, indeed, to point to an *i* stem, but *quem* may perhaps have come into use in order to avoid confusion with the conjunction *cum*, while side by side with *quibus* we also have the form *quis*. *Qui* and *quae* resolve themselves naturally into *quo-i* and *qua-i*, forms which are supported by the corresponding forms in the Italian dialects. The declension of the two pronouns has, perhaps, owing to the singularity of the nominative singular, been nearly reduced to one, the oblique cases of *quis* being mostly formed from an *o* stem, as in the case of *is*; but this seems rather to prove some later confusion than the original identity of the two stems.

But the most startling novelty of all is to be found in the section on the verbs, where the dreams of our childhood are rudely dispelled by the author's denial (p. 199, foll.) that the perfects in *-ui* and *-si* are formed directly or remotely from the auxiliary stems *fu-* and *es-*. This paradox, for such we must still consider it, is supported by a number of minor arguments; but the author lays most stress upon what he considers the improbability of a Latin compound being formed by the junction of an inflected word with an uninflected stem (*ama-fui*, *die-si*). He will not accept as instances to the contrary such words as *assue-facio*, *cande-facio*, *are-facio*, the first part of which he considers may possibly represent old infinitives in *-e*, arguing from such phrases as *cande quoque faciunt*, *facit are*, &c., in which the two parts of the compound are separated, that a consciousness of the independence of the parts must have been present to the minds of the writers who used these expressions. Possibly; but Ennius does not scruple to separate the two parts of *cerebrum* in his celebrated *saxo cere minuit brum*, from which it would not be prudent to draw any etymological inference; nor is it at all improbable that in using phrases like *cande quoque faciunt* the Romans were misled by the analogy of *bene* and *male facere*. But even if we were to concede that in *cande-facere*, &c. the first part of the word is an old infinitive, what is to be said of such compounds as *arci-tenens*, *silvi-cultrix*, or the Greek *χερ-νιπτοῦς*? Here surely we have an uninflected stem compounded with an inflected word. The possibility of such compounds being shown, we have to consider whether in *ama-vi*, *mon-ui*, and perfects like them, *-ui* grew out of an original simple *-i*, or represented in its *-u* an independent stem. Without dwelling too much on the case of *pot-ui*, which may possibly be a copy and not the model of other perfects in *-ui*, it may unhesitatingly be said that all analogy both of Latin and of the Italian dialects, which exhibit perfect-endings in *-fi* and *-fed* corresponding to Latin *-ui* and *-uit*, is quite against the notion of the growth of a *u* out of the vowel which followed it. The growth of consonants out of

following vowels is an exceptional, not an ordinary, fact: forms such as *matuwa*, *posuuit*, *Larisaeuus*, and others quoted from Schuchardt by Dr. Merguet, are bastard growths, which probably admit of their own explanations either as mistakes or as false analogies: the general tendency of Latin being far more to wear away existing consonants than to create new ones before a vowel by a strengthening of the breathing. The ordinary theory that *-ui* is an abbreviation of *-fui*, if it does not absolutely run on all fours, offers at least a highly probable explanation of the facts, as the present writer endeavoured to show in his notice in these pages of Mr. Roby's *Latin Grammar*: as for the perfects in *-si*, Dr. Merguet himself grants that they correspond to the Greek aorists in *-σα*, nor do we think he shows any sufficient reason for rejecting the commonly received explanation of them.

It is to be regretted that a writer who shows at times so much insight and ingenuity as is displayed on many minor points in the discussions in this treatise should, on some of the main questions of Latin grammar, have adopted (as it seems to us) such perverse conclusions. The book, it should be observed, is left very incomplete by the absence of all treatment of the prepositions, adverbs, and conjunctions.

H. NETTLESHIP.

Six Lectures introductory to the Philosophical Writings of Cicero; with some Explanatory Notes on the subject-matter of the *Academica* and *De Finibus*. By T. W. Levin, M.A. Cambridge: Deighton, Bell, and Co., 1871.

THIS book has a somewhat misleading title, since it is in the main a survey of ancient Scepticism, from its small beginnings in the days of Socrates to the time when it became an organized assault on all forms of theoretic belief and the accepted doctrine of a school. The chief points which come within the survey are the scepticism of Pyrrho, who seems to have formulated the universal doubt in the interests of practical ethics, and that of the New Academy, which was probably inspired by no higher motive than sectarian animosity to Stoicism. The author has not restricted himself to a merely historical review of his subject. Evidently no believer in M. Renan's axiom, "le jugement critique exclut le jugement dogmatique," he gives us along with the bane the antidote, in the shape of an exposition of the grounds of Scepticism with hints as to the way to meet the sceptical conclusion. The antidote, it seems, involves the acceptance of what we may call, in default of a better name, an insular variety of Kantism. Whether Carneades would be bound to admit this solution of his doubts, is perhaps for us, as for him, supremely unimportant. Nor is it necessary on our part to do more than enter a protest when we meet with the confident assertion that "the morality of Pyrrhonism, however low and unsatisfactory it may have been, was really only the inevitable result of the rejection of all *a priori* sources of knowledge" (p. 37); or when it is assumed that there was some natural correspondence between Scepticism and "the universal corruption of morals" which, if we may trust Mr. Levin, characterized a certain period of antiquity. Setting aside our dissent from his conception of history and of the logic and ethics of historical enquiry, we cannot say that his procedure in less disputable matters deserves unqualified approval. We think he might certainly have taken a wider view of the literature of his subject and made a wiser use of the materials he had. His authorities hardly appear to advantage in his pages. He gives us, for instance, an English version of a long passage in Brandis, who, in some remarks on the sceptical theory of evidence, naturally enough introduces the expression, "erin-

nernde Zeichen," a perfectly intelligible German equivalent for the Greek *ὑπομνηστικά σημεῖα* more than once employed by Sextus Empiricus. Now instead of adopting the traditional English equivalent, "admonitive signs," or inventing some new one, Mr. Levin in two places suppresses this technicality altogether, and in a third represents it by a highly dubious paraphrase, "remembered impressions"! However, if the translations from the German are inexact, a stronger epithet is needed to describe those from the Latin. We fail to discover any sense or coherence in a passage like the following :—

"He has obscured it, however, either by his scholastic handling, or, as those who are well acquainted with this kind of Cicero's works will more probably think, he has derived it from that Greek writer whom he had elected as his guide when composing the book" (p. 189).

The original of all this, nevertheless, is a perfectly simple and straightforward sentence :—

"Eum [sc. ordinem] aut ipse adumbravit scholae formam sequens, aut, quod probabilius putabunt, qui hoc genus librorum Ciceronianorum intus norunt, ab eo scriptore Graeco sumpsit, quem sibi ducem elegerat in hoc libro componendo."

This is what Madvig says (in an excursus to his edition of the *De Finibus*), and one would have thought it impossible for any one to misunderstand it. Yet in the dozen pages which Mr. Levin has been so ill-advised as to translate from Madvig we might easily point out a dozen specimens of interpretation of precisely the same stamp as the above, or even worse. Strange as it may seem, the translator would have avoided one or two of his most serious errors, had he remembered that Madvig was writing for students of the *De Finibus*, and presupposed in his readers an acquaintance with the philosophical ideas and language of that book, as well as a competent knowledge of Latin. I. BYWATER.

*Observationes Criticae in Cl. Galeni librum περί ψυχῆς παθῶν καὶ ἀμαρτημάτων.* Scripsit Johannes Marquardt. Leipzig: Hirzel, 1870.

Iwani Muellieri *Quaestiones Criticae de Galeni libris περί τῶν καθ' Ἱπποκράτην καὶ Πλάτωνα δογμάτων.* Erlangen: Junge, 1871.

*De Galeni Historia Philosophia.* Hermannus Diels. Bonn: Georgi, 1871.

It would be difficult to say why modern philology has done so little for Galen—a writer who occupies no inconsiderable space among our extant remains of classical antiquity, and one who presents much of indisputable interest to the historian of science and philosophy. To this neglect alone we must attribute the shameful fact that Kühn's edition still keeps its place in libraries. If the scandal remains much longer, we shall certainly be without excuse, as we now know (what we before only suspected) that Kühn's book is the merest makeshift, and as offensive to the critical sense as it is to the eyes of the reader. The better light we now enjoy is in great measure due to the labours of three scholars, who, simultaneously but independently of one another, have been working in the same mine and arrived at similar results. First in order of publication comes Herr Marquardt with a dissertation on the treatise *περί ψυχῆς παθῶν καὶ ἀμαρτημάτων*, pointing out the paramount importance for textual purposes of a Laurentian MS. (74, 3) of the twelfth century. In a similar spirit, and with an ampler supply of materials, Prof. Iwan Müller, of Erlangen, discusses the treatise *περί τῶν καθ' Ἱπποκράτην καὶ Πλάτωνα δογμάτων*. With the exception of the Aldine editor and an erudite countryman of our own, famous in Cambridge annals as having given his name to Caius College, the critics of the book have worked in the dark, and with no knowledge of the manuscripts: Kühn's edition depends on that of Chartier, Chartier's on the Basiliensis of 1538, and this last on the Aldine; so that

it may be imagined how seriously the vulgate has receded from the genuine and primitive form of the manuscript tradition. Thanks to Prof. Müller it is now ascertained that the oldest and best text is that preserved in a Laurentian MS. (lxxiv. 22), and one at Cambridge, both incomplete, but supplementing each other in such a way that they must be considered to have originally formed part of one and the same volume. Still more valuable is the essay of Dr. Diels, who shows (1) that the *Ἱστορία φιλοσόφου*, so far from being Galen's, is the work of some sorry compiler who took his materials from Sextus Empiricus and the collection of *placita* in Plutarch; and (2) that the book as we now have it is in the most unsatisfactory condition that can be conceived. When first printed (in the Ed. Princ. of Aristotle), the text seems to have been directly or indirectly derived from the excellent Laurentian MS. (74, 3) to which Herr Marquardt has drawn attention. It assumed a new form, however, in the hands of Martianus Rota, a learned Venetian physician, author of a Latin translation which appeared at Basel in 1542. The additions and improvements suggested by him were adopted by Chartier, and thus passed into Kühn's edition, where we read them without note or comment, as though they had been an integral part of the Greek text from the first. Having pointed out the delusive character of the book as it stands, Dr. Diels proceeds to give us a considerable specimen of an entirely new recension founded directly on the Laurentianus, and with emendations by himself and other scholars. But, as Prof. Curtius Wachsmuth reminds us in an elaborate article in the *Gött. gel. Anz.* (1871, St. 18), the Laurentianus is not our sole authority in the matter, since there exists a medieval Latin version by Nicolaus of Reggio, dating from as early as 1341, and preserving a number of important and suggestive variations. Dr. Diels will doubtless tell us more about these in the larger work of which the present dissertation is the forerunner.

I. BYWATER.

#### TO THE EDITOR OF THE ACADEMY.

SIR,—In the *Academy* of April 1 (vol. iii. p. 140) a review of certain Assyrian discoveries of Dr. Oppert, which appeared in the *Journal asiatique*, xviii. 67 (1871), and was signed J. M., was ascribed to M. Joachim Ménant, the well-known Assyriologue. The statement has been repeated in my *Grammar* (p. 182). M. Ménant, however, has written to inform me that this is a mistake, as the article in question was not from his pen.

A. H. SAYCE.

*Queen's College, Oxford, September 1, 1872.*

#### Contents of the Journals.

The *Journal of the Cambrian Archaeological Association* for July opens with an excellent essay by Stephens on the Bardic alphabet called "Coelbren y Beirdd," which is shown to have been a mere modification of the Roman alphabet cut on wood by the Welsh, when the importation of paper into Wales had been successfully prevented by the English in the fifteenth century. The Bridell Ogham made out by Fergusson to be "Netta Sagro hoc Oudoco effeci" is made by Brash to read, "Neqasagrom Maqi Mucoi Neci," and explained in his usual wild way. Karl Meyer's article on the Welsh poems in the *Codex Juvenius* is quite a curiosity. The journal is however fast improving in the hands of its present editor.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 57.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for. The Editor cannot reply to questions from authors respecting the notice of their books. The next number will be published on Tuesday, October 15, and Advertisements should be sent in by October 11.*

## General Literature.

**Ranolf and Amohia.** By Alfred Domett. Smith, Elder, and Co. Poems by V., Author of *Paul Ferroll*. Longmans.

It is common enough to find the form and something of the spirit of poetry without the substance; it is not so common, and to those who can distinguish between substance and shadow it is a welcome surprise, to find the raw material of genuine poetry in rich profusion, though uninformed by a true poetic thought. In *Ranolf and Amohia* we have charming scenery (in the widest sense) depicted from the fullest knowledge; we have characters conceived with a good deal of insight and realised with a good deal of force; we have even a romantic story managed with enough regard to probability to be interesting, and the result of all is an unsatisfactory poem. There is no unity in the style and manner of the book: the plan and management of the story and the metre in the happiest passages remind us continually of Scott; here and there we come across a flavour of Shelley in his most abstract and least felicitous mood. And, as perhaps might be expected, we have paragraphs upon paragraphs not in the manner of Mr. Browning, but in the manner into which it would be easiest for Mr. Browning to degenerate, if we could conceive him divested of his tutelary subtlety and with all his mannerisms heightened—especially the fondness for describing one thing in terms of another, with which it is only related through the arbitrary associations of a too fertile fancy. And these elements lie together in juxtaposition without penetrating one another, without being fused into even a superficial unity by the individuality of the writer. The substance of the book is not quite so disjointed as its form, but such unity as it has is ethical, not artistic. One gets a tolerably complete impression, not of an episode in the hero's career, but of a stage in his spiritual development. He is introduced to us at the close of a hunt, like James Fitzjames, only he has had his dog killed instead of his horse, and he has killed a boar instead of having lost a stag; also he moralises, which Fitzjames does not, for a page or so on the immortality of animals. After this he meets the heroine, and delivers her from his own followers, who meant to carry her off to their own chief as soon as their master (the hero) could dispense with their services. Then for two mortal cantos we have a succinct and tedious account of the hero's education: how he went to sea and came home and studied speculative philosophy, from Buddha to Hegel; how he found commonsense reasons which satisfied him for disagreeing with all philosophers (for one thing, most came round to Buddhism), and falling back upon the simplest form of cultivated optimism.

VOL. III.—NO. 57.

The analysis and criticism of the different systems show that a good deal of reading and thought has run to waste upon them. There is no direction in which the unsustained pretensions and the unfulfilled promises of metaphysicians do more mischief than by attracting the misplaced curiosity of intelligent persons without a genuine speculative impulse. Having thrown away Hegel and exorcised materialism, Ranolf has to exhaust the "earnest" commonplaces as to the *pros* and *cons* of a profession. Before he has decided, his father dies and leaves him free to go to sea again. After half a canto of nautical experiences, which might have been polished up into pretty little independent poems, we have a shipwreck, not without power, but much too long. Then he and we are introduced to the natives, their manners and customs, and mythology; this part of the poem proves that the *Lady of the Lake* would still have been readable if Scott had versified all the notes and embodied them in the text. The chief to whom Amohia was betrothed in her infancy is happily buried by a liquid landslip, but the sorcerer who made the match to keep up his own importance immediately arranges another. By this time Amohia is in love with Ranolf, so she flies to avoid being made "tapu" again. To prevent her escape, all the canoes have been drawn up; but she swims the lake to him. This is beautifully described, but there are too many beauties; for instance, she rests herself by floating, and as it is night she sees and admires the stars, though, as she knew no astronomy, they could not be for her what Mr. Domett cannot help describing for four pages. When the lovers meet, they marry (which in New Zealand seems to be as informal a business as seduction is elsewhere), and set off to the tribe of the heroine's mother. On the way they receive intelligence that the lady's father, Tangi Moana, "The Wailing Sea," has quarrelled with the priest, and is prepared to sanction the match, so they wander home through the strange country round Lake Mahana. On their arrival they find the priest has stirred up a coalition against Tangi Moana, who is attacked in his island fort, and, though mortally wounded, gains the victory by the help of Ranolf's revolver. The battle is capitably described, after Mr. Domett has protested through six pages that fighting among savages cannot be so poetical as the civilised warfare of Wellington and Nelson and other British heroes. After the death of Tangi a new complication arises. Ranolf begins to pine for books, while he shrinks from the obvious embarrassments of taking a savage wife to England; Amohia chooses to assume that he is pining for English girls, so she resolves to prove her love for him by surrendering herself voluntarily to the chief of a new coalition, which the sorcerer has egged on to secure her hand, and, in case of presumable resistance, to demolish her tribe and her husband. On her way to the sacrifice she meets the sorcerer, who makes an unsuccessful attempt to arrest her, and is swallowed up in a pool of pitch. She falls into a river, and is supposed to be drowned, and on her revival is detained by the chief of the village where she has been nursed, who wishes to have the merit of surrendering her to his lord-paramount, the chief of the coalition. Here she meets Ranolf, who is in despair at losing her, and is waiting for a passage to England. Her escape is easily arranged, and we take leave of them making love on the voyage, but the author will not let us go without some final moralising on the effects which his experience must have produced on the hero's character.

The best and most original parts of the book are the descriptions of New Zealand scenery (the manners and mythology, though cleverly managed, are done at second hand), and the purely idyllic passages. We give a specimen of the latter, not as the prettiest but as the easiest to isolate:—

"The kisses prest with youthful passion  
On Amohia's cheek were not alone  
The first those lips from one she loved had known—  
*They were the first she ever felt at all!*  
A novel mode, a strange too fervent fashion,  
Of salutation or caressing this!  
What aid, what safeguard to her side to call  
This subtle soft assailant to repel,  
This cunning and insidious foe—a kiss!  
Was it not thrice too thrilling? Might not well  
This meeting of the lips and breath appear  
Spirit to spirit, soul to soul, to bring  
Too dangerously close—too fondly near?  
Through joining lips seemed heart to heart to cling,  
And had not breath and spirit but one name—  
In hers as many a rougher tongue the same?"

It is a pity that an author who can write so well should have spoilt what might have been a really beautiful poem, by trying to pour all the thought and experience of a lifetime into it.

The title-page of the volume of poems by the author of *Paul Ferroll* reminds us that the *Quarterly Review* in 1840 committed itself to the belief that the nine poems, which were all Mrs. Archer Clive had yet published, contained stanzas "worthy of any one of our greatest poets in his happiest moments." Certainly we are more struck with the quality of the writer's talent than with its quantity, and yet this quality is too abstract, not to say too ghostly, to be really individual. The originality of the poems lies wholly in their intensity. There is nothing uncommon about the style, which never emancipates itself from the conventional range of the better class of album verses. There is nothing uncommon about the topics. We are all familiar with the certainty that the young will be old if they live long enough, with the hope that death may be the gate of a new life, and reunite parted friends. The thoughts are common even when the writer gets hold of such an out-of-the-way subject as the death of Cancellor, whom Mr. Hopley conscientiously went on beating as recommended by Locke, but unluckily the boy died under the treatment before it had subdued his half stupid, half vicious obstinacy. Any modern writer taking up such a subject would turn from the horror to the psychological curiosity, but "V." fastens upon one corner of the horror and keeps to it. She dilates upon the thought how shocked the poor lad's mother must have been to think she was comfortably in bed while it was happening. The poem is not one of V.'s best; but even here one half-stanza is unmistakably powerful and strange—

"Next morn an hireling did the first kind deed,  
And wiped the face no longer his but its."

And this is V.'s peculiar distinction to be so powerful as to be strange without ceasing to be obvious; she sees nothing which other people do not see, but she cares with all the strength of a proud, passionate nature about things that other people seldom care about. Anybody who read in the paper that a hundred and fifty invitations were sent for a Queen's ball for people who had died since the last could have guessed that some ghosts might have accepted the invitation to see if their daughters or sweethearts or brothers remembered them. Yet the *Queen's Ball* is a genuine and remarkable poem, because the writer expends so much deep and sustained feeling upon her hypothetical ghosts that we hardly miss the dry *recherche* subtleties which Miss Rossetti, for instance, would have invented for said ghosts to think. It is the intensity of realisation which makes *The Grave* solemn instead of rhetorical, not to say theatrical. The silence of the grave is a common thought, but this is not a common stanza—

"Around me stretched the slumbers of the dead,  
Whereof the silence ached upon mine ear;  
More and more noiseless did I make my tread,  
And yet its echoes chilled my heart with fear."

In the later poems there is at least one instance where the writer's singular personality has clothed itself in something like the inventive prettiness which we expect from all the readers of the Laureate. The following stanzas close a poem on *Old Age*:—

"And once or twice in age there shines  
Brief gladness, as when winter weaves  
In frosty days o'er naked trees  
A sudden splendour of white leaves.

"The past revives, and thoughts return  
Which kindled once the youthful breast;  
They light us, though no more they burn,  
Then turn to grey and are at rest."

Both metaphors are beautiful, and beautiful as they are, their value is increased by the plain sobriety of what goes before.

It is curious, perhaps, that so abnormal a nature should be so eagerly submissive to traditional beliefs; the only approach to a cry of revolt is the feverish prayer for death at once sudden and triumphant, which forms the substance of the lines written in health. Perhaps it may explain this submission if we remember that mental intensity does not always imply mental activity, and that the author of *Paul Ferroll* has certainly written very little. Perhaps, too, this submission is one condition of the sustained quietness to which so much of the power and the horror of that singular tale is due.

G. A. SIMCOX.

#### LITERARY NOTES.

The German papers contain interesting accounts of the last illness, death, and funeral of Ludwig Feuerbach (on whose place in modern speculation we had some remarks not long since). The aged philosopher had been seriously impaired in his faculties since his first stroke in 1867, and had almost entirely lost his power of speech since the second, a few months ago. On the evening of September 2nd, he was enjoying the sunset from the verandah of his house at Nürnberg, with the members of his family and a Russian visitor, and was immediately afterwards taken with bronchitis, which ended fatally on the morning of the 13th. An immense concourse attended his funeral at the famous cemetery of St. John, and many speeches were pronounced. The occasion was taken for a demonstration on the part of the Socialist Democrats of the *Section Fürth* and *Section Nürnberg*, who marched to the funeral five hundred strong, bearing red flags; their leader, Herr Memminger, after the official oration had been delivered by Herr Scholl, coming forward to lay a wreath upon the grave in the name of Herren Marx, Jacoby, Bebel, Liebknecht, and the socialist and republican party in general.

The fifth number of *La Crónica de los Cervantistas* contains an article by the editor on "Cervantes in Toledo."—Don N. Diaz Benjumea, chief of the school of "spiritual" interpreters of *Don Quixote*, writes from London giving news of the progress of a new English translation, spoken of, as we have reason to know, too favourably as being "very far advanced."—The eminent Cervantophile, Pardo de Figueroa, who chooses to wear the thin mask of M. Droap, contributes another "Epistola Droapiana."—Señor Barrera defends his opinion of the genuineness of a tract usually attributed to Cervantes, though published without his name, containing a narrative of the festivities at Valladolid on the occasion of the birth of Philip IV. in 1605.—Don Manuel Cerda continues his bibliography of Cervantes' works; and Father Sbarbi his astonishing polemic, proving the author of *Don Quixote* to have been a sound theologian.

Friedrich Bodenstedt, whose *Lieder des Mirsa Schaffy* have already passed through forty-one editions, has just published his first novel, *Das Herrenhaus im Eschenwalde*, which is expected to have as much vogue as the shorter tales published last year under the title, *Aus deutschen Gauen*.

The 20th of October will be the two hundredth anniversary of the birth of the great compiler, Lodovico Antonio Muratori. The firm of Zanichelli in Bologna announce their intention to commemorate this date with a volume of documents and original pieces—*Scritti inediti di L. A. Muratori*—prepared with the collaboration of various scholars. The volume will be divided into two parts: the first will contain contemporary documents, edited by Cesare Foucard, in illustration of Muratori's career as archivist, librarian, and court councillor; the *Treatise of Moral Philosophy for the use of the Prince*, edited by Professor Galassini, a set of letters to Cardinal Quirini on the restriction of festival expenses, and some more miscellaneous letters;—the second, an *Autobiography*, addressed to Giovanni Antico de' Conti di Porcia, and a *Catalogue* of the bard's *Archives*.

There are some important English announcements for the ensuing season. Mr. Tennyson will finally complete his Arthurian cycle with an *Idyll of Gareth*, to be published in a volume together with *The Last Tournament*. Mr. Morris's poem of *Love is Enough*, which has been written some time, and was to have awaited the completion of a set of designs and illustrations by the author and Mr. E. Burne Jones, is now, we understand, to anticipate these embellishments in a plain edition already in the press. Lord Lytton announces a novel of society and reflection, under the title *Kenelm Chillingly*.

## Art.

### ART NOTES.

A fine portrait of Eugène Delacroix, painted by himself, has been hung in that gallery of the Louvre which is appropriated to works of the modern French school. The painting in question is a vigorous but rather slight piece of work, and appears to belong to that period of the artist's life in which he was in the fullest exercise of his powers, and comparatively simple in the methods he employed. He bequeathed the picture to his servant, M<sup>lle</sup> Leguillon, who in her turn has bequeathed it to the museum of the Louvre.

M. Hector Horeau, one of the most distinguished amongst modern French architects, has just been carried off by death. M. Horeau was born at Versailles on October 4, 1801. In 1850, he competed for the Crystal Palace; but although his design was selected from amongst two hundred and forty-five others contributed by artists of all nations, and although it received the first medal, it was set aside for that of Sir Joseph Paxton, who was strongly supported by Prince Albert and the great engineer Stephenson.

On August 11, Friedrich Eggers, Dr. Phil. and Professor of Art-history at the Royal Academy of Berlin, died in that city. After the death of Kugler, Dr. Eggers conducted the *Deutsche Kunstblatt* up to the date of its extinction.

Count von Usedom has recently entered on his office of General-Director of the Royal Museum of Berlin. Dr. Ernst Curtius has been named Director of the Museum of Antiquities; and Dr. W. Bode as Directorial Assistant to the Galleries of Sculpture and Painting. Professor Springer has been called to the University of Leipzig, to fill the newly created chair of middle-age and modern art-history. Professor Springer was but recently nominated to Strassburg from Bonn.

Signor Demetrio Salazar communicates, in a letter to the editor of the *Zeitschrift für bildende Kunst*, two interesting discoveries which have been lately made in the library of the Naples National Museum. The first is that of a *Trattato della Miniatura* of the fourth century, a treatise on the technic of miniature-painting at that time, on the preparation of the colours, on the employment of gold, &c., which has never been published nor even inscribed in any catalogue. The second find is a portrait of Desiderius, afterwards Pope Victor III., which occurs in a

Montecassino MS. Judging from the importance of the portrait and the style of the drawing, Signor Salazar is inclined to consider it the work of Leone Amalfitano, the originator of another Codex of Montecassino, in which a similar portrait is found. The zealous inspector of antiquities expresses a hope that he may speedily be able to publish the treatise, and he announces that the portrait will be reproduced in his intended work on South Italian antiquities from the fourth to the thirteenth century.

The example set by the town-council of Nürnberg in commencing the wholesale destruction of the historical monuments of the city has not been without its result. Inspired by a like ardour, some unknown person or persons have been going about destroying whatever lay handy to their reach. First one of the stone oxen on the Fleischbrücke had its horns knocked off, next the figure of God the Father on the Moritzcapelle was mutilated, and now the ironwork which protected Rauch's statue of Dürer has been torn down and partially carried away. A bystander of the poorest class, seeing two civic dignitaries gazing curiously at the wreck, gave vent to his feelings with "*Na, der macht's eben dem Magistrat nach, die reissen ja auch Alles ein!*"

The Milan Exhibition, opened August 26 (see *Academy*, vol. iii. p. 327), is divided into two parts: one represents the modern, the other the earlier Italian school. Something over five hundred artists have contributed to the division of modern Italian painting and sculpture. The division for earlier work is devoted especially to the epoch of Lionardo da Vinci, in honour of the erection of his memorial. The gallery of paintings contains about two hundred and fifty works of the chief and most interesting masters of the old Lombard school, such as Mantegna, Luini, Gaudenzio Ferrari, Beltraffio, &c. Works of sculpture, goldsmith's work, woodcarving, all of the same age, abound; a special place is also provided for Agostino Busti's monument to Gaston de Foix.

A descriptive catalogue of the contents of the Grüne Gewölbe has now been given to the public by Dr. J. G. Th. Grässe, the director of the Grüne Gewölbe.

The *Zeitschrift für bildende Kunst* for September 6 contains—an article on Eduard von Gebhardt, one of the most distinguished pupils of the Düsseldorf school, by Bruno Meyer. The article is accompanied by an engraving of von Gebhardt's painting, "*Die Erweckung von Jairi Töchterlein*," painted in 1864.—Von Engelmann concludes his series of valuable notices of the last excavations at Pompeii and Herculaneum.—R. Zimmermann writes a short notice, but much to the point, on *Neue Schriften über Aesthetik*.—Dr. Thausing reviews Arnold's recent publication, *Das Werk von Georg Christian Wilder*.—The present number is distinguished by containing various proofs of wood-engravings from the catalogue of the *Ornamentstichsammlung* of the Austrian Museum of Art and Industry. One example after Jobst Amman is remarkably spirited and artistic. An etching after Tintoretto by Unger also deserves notice. As a piece of translation it is admirable.

The number for the 31st August of the *Fahrbücher für Kunstwissenschaft* commences with an essay by Professor F. Piper on the subject of *Maria als Thron Salomo's*. Professor Piper's original intention in writing the paper was simply to furnish a descriptive comment on a picture in the Christian Museum of the Berlin University to the catalogue of the collection. He enters upon a very elaborate and careful investigation of the symbol, of the various modifications in its treatment, and of the signification of the different and varying accessories. Having found in Christ the true Solomon, and addressed his mother, "*Ave veri Salomonis mater*," the next step was to find in the component parts of Solomon's throne foreshadowings of the virtues of the Virgin. Then Peter Damien, preaching on the birth of the Virgin, points out that she is herself that marvellous throne; the ivory betokens her maiden modesty, the gold the Godhead by which she is overshadowed; the two lions at the elbows are the Archangel Gabriel and St. John the Evangelist, and the twelve lions of the steps are the Twelve Apostles. Professor Piper gives a plan of the picture to which we owe his interesting paper.

Dr. Ed. Dobbert contributes a few remarks on the treatment of the Last Supper in Byzantine art.—Wilhelm Schmidt sends notes on Holbein's portrait of himself, in the Uffizi at Florence, and on Nicolaus von Neufchâtel.—Dr. A. von Zahn writes on the *Ergebnisse der Holbein-Ausstellung zu Dresden*. In a note he gives a communication made to him by Professor Fechner, of Leipzig, after the essay was in print, which may possibly prove of importance by making fast one more link in the pedigree of the Darmstadt Madonna. Herr Ernst Benedict Kietz, an artist who resided long in France, writes to Professor Fechner from Zürich, 7th August 1872: "M. [Pierre] Énard, the pianoforte manufacturer, now dead, showed me in his château La Muette at Passy, which belonged to Marie Antoinette, the gallery which his uncle (Sebastian), the founder of the business, had had built expressly for his fine collection of pictures, in which still hung only a few but good old paintings. He expressed his sorrow that this collection, after his uncle's death without children, had to be sold on account of the heirs, and amongst others a Holbein Madonna, which was in no wise behind the famous Dresden one." Waagen mentions that Spontini obtained the Darmstadt picture for Prince Wilhelm through his brother-in-law Delahante, and it is a significant fact that Spontini's wife was a sister of Pierre Énard. But there are some dates to be set straight. Sebastian Énard, at whose death the picture should have changed hands, died in 1831, and according to Waagen in 1822 the Madonna had already arrived in Berlin. Possibly M. Pierre Énard may be in error as to the time at which his family parted with their Holbein.—Albert Jahn has some interesting notes on the sketchbooks of three Renaissance masters, in which he draws attention to the rich fund of materials lying unexplored in the library at Siena.—A paper by Georg Dehio, on the Theodoric statue at Aachen, concludes the number.

### Theology.

The Authorship and Historical Character of the Fourth Gospel considered in reference to the Contents of the Gospel itself. A Critical Essay by William Sanday, M.A., Fellow of Trinity College, Oxford. Macmillan and Co.

In this essay, which has been already commended to the notice of the readers of the *Academy* (vol. iii. pp. 167, f.), Mr. Sanday has examined in detail the contents of the Fourth Gospel with the object of determining from internal evidence the authorship and the historical character of the record. For carrying out this purpose he has submitted the whole Gospel to an elaborate analysis, and discussed with exhaustive care the various details which affect his enquiry as they present themselves. This critical investigation of the Gospel occupies the first seventeen chapters of the essay. The three remaining chapters deal with the *Current Arguments against the Genuineness of the Gospel* (xviii.), the *Summary Proof of the Genuineness of the Gospel* (xix.), and the *Hypothesis of Mediate Johannine Authorship* (xx.).

The general conclusion at which Mr. Sanday arrives is the only one, as we believe, to which a complete, impartial, open-hearted examination of the Gospel, as a whole, such as Mr. Sanday has set before the English reader, can lead, that "the Gospel is the work of the Apostle, the son of Zebedee;" that "it is the record of an eye-witness of the life of our Lord Jesus Christ;" and that "its historical character is such as under the circumstances might be expected;" "it needs" (Mr. Sanday adds) "no adventitious commendation to make it higher." But to obtain this conclusion from internal evidence, it is necessary that the enquiry should be free; and it is obvious that no critical examination of the Gospel can be free which starts with the assumption that the Resurrection (for example) is a myth and not a fact. In such a case the critic has to account for the appearance of phenomena in the narrative which are inconsistent with historical truth; and this assumption, which is generally made tacitly, produces a problem so different from that which is ostensibly put forward in the criticism of the life of Christ that nothing but error can arise from confusing the two together. To conduct an investigation into the worth of a record after predetermining either avowedly or by implication that an essential part of its contents must be legendary is to beg the question in debate. "The attitude proper to an enquiry . . . when the exact value of the historical evidence is the point at issue, will be" (as Mr. Sanday most justly observes, p. 48) "to assume provisionally that miracles are credible" (comp. p. 126, note; p. 271, note).

This necessary assumption, however, is the only one which Mr. Sanday makes; and even those who refuse to grant it will acknowledge the perfect truthfulness, candour, and sobriety, with which he takes account of the separate difficulties of each miraculous narrative. If the difficulties appear in his analysis to be less than they are commonly held to be, it is simply because they are not picked out and grouped together, but left as parts of an organic whole. Nothing is slurred over or extenuated, but the grounds of objection naturally assume their true proportion when they are regarded in connection with all the phenomena of the Gospel (see pp. 163, f.; 295, f.; 302, f.). The greatest merit of Mr. Sanday, and there can scarcely be a greater, is indeed this: that he brings before the student the many-sided character of the record with calm and patient exposition; that he points out its spiritual affinities with particular forms of thought and a definite crisis of national development; that he brings back the attention from isolated points to the general scope of the entire history; that he treats the author as a living man, and the events which he describes as actual events, reflecting in countless subtle ways the influences of an age and place rich beyond all others in the elements of an intense and manifold yet transitory religious life. Thus, for instance, he traces out with singular skill the relation of the current Messianic idea to the progress of the work of Christ as depicted by St. John. "It is almost superfluous," he remarks—and the observation may be extended to St. John's portraiture of Judaism throughout—"to point out how difficult, how impossible, it would have been for a writer wholly *ab extra* to throw himself into the midst of these hopes and feelings, and to reproduce them, not as if they were something new that he had learnt, but as part of an atmosphere that he had himself once breathed" (p. 124).

But the question of real difficulty in the Gospel of St. John is not that of authorship, nor yet of the truth of the facts which it relates, but of the essential authenticity of the discourses of the Lord contained in it. On this question Mr. Sanday decides that "the discourses must have undergone a sensible modification in the mind of the Apostle

before they came to be written down" (p. 73); that they "are deeply tinged with the individuality of the Evangelist" (p. 128); that "what is presented as a single discourse is probably made up of the fragments of several fused together and transmuted in the mind and memory of the Apostle" (p. 114); that "it had become impossible for the Apostle to separate the subjective and objective elements in his own mind" (p. 141); that "the discourses are all no doubt repeated under the impression that they represent what was actually spoken," but that "it is impossible for an active mind to retain the exact recollection of words over a space of perhaps fifty years" (p. 222, comp. p. 300); while still "they are not so far subjective as that they cannot have been written by an ear-witness and an apostle, or so as essentially to misrepresent the originals, of which they are the reproduction" (p. 275).

In drawing these conclusions, we venture to think that Mr. Sanday has not given sufficient weight to several considerations which tend to modify them very greatly. It is at the outset unlikely, as a mental phenomenon, that the memory of the Evangelist should have preserved with intense vividness the minutest circumstances of action, and then at once have failed in the reproduction of words which were bound up with the fact. Moreover, if we once admit that the Gospel lives in an atmosphere of miracle, there can be no difficulty in believing that the natural powers of St. John were quickened to enable him to fulfil his work. It may also be added that it is a perfectly gratuitous assumption (though it seems to be universally current) that the discourses in St. John's Gospel were put together or committed to writing later than the discourses in the Synoptists. So much is clear from the whole structure of St. John's narrative that it represents oral teaching which he had long addressed to a circle of believers (this explains the comments, iii. 16-21; 31-36, on the discourses which precede them), just as the public oral teaching of the Apostles generally was unquestionably the ultimate basis of the Synoptic narratives. There is then nothing improbable in the supposition that the two cycles of teaching began to take shape from the first establishment of the Church (see v. 2, *ἐκτίσθαι*); and if it were so, it is evident that one would have a wide and open currency, while the other would be kept within very narrow limits, and circulated only under something of reserve, and not shaped into a gospel till the very close of the apostolic age. But not to insist on this conjecture, which is at least as plausible as the popular opinion, there are several features in the Johannine discourses themselves which require to be brought into prominence before they can be rightly understood. They are compressed, often discontinuous, and at once (by a strange paradox) most specific and most universal.

The record of a living controversy is like the record of a battle. It is no more necessary to reproduce all the words spoken in the one than it is to describe all the incidents in the other, in order to give a true account of it. No one probably, supposes that St. John has preserved all the words which the Lord spoke on the occasions described in chapters v.-viii. It is enough if the selection of utterances which he has given conveys (as we believe it does) a perfect record of that aspect of the discourses which the Evangelist designed to portray. There is often need of the greatest patience and of the most watchful criticism to observe and follow the thread of thought which was (no doubt) fully developed in the spoken discourse. Such (to take one instance) is the origin of the difficulty in viii. 13, 14. In the same way, we find implied or explicit reference to unrecorded conversations which were present to the mind of the Evangelist, and probably were familiar to his first hearers. Thus, for example,

some earlier discussion on Isaiah liii. (and what could be more natural?) seems to have given occasion to the words of the Baptist, i. 29 (comp. pp. 40, ff.).

A sense of the discontinuity of the discourse is even more necessary to the right understanding of them in many cases than a sense of their compression. It happens frequently that the interlocutors are changed, that questions or objections are passed over silently, that even the scene is altered, while, on a superficial view, nothing of all this is apparent. In viii. 30; 32, ff., the change of tone depends upon a distinction in the character of the audience, which even Mr. Sanday overlooks (p. 155). Out of the "many who believed on Him" (*ἐπιστεύσαντες αὐτῷ*) a special group are taken—"the Jews who believed Him" (*οἱ πεπιστευμένους αὐτῷ Ἰουδαῖοι*). In the body of the new disciples there were representatives of the degenerate hierarchy who admitted the claims of Jesus to be Messiah as true, and yet interpreted His office according to their own false views wilfully and persistently. St. John's use of the term "Jews," and the change in the construction of the verb, emphasize the transition, and when it is recognised, the general difficulties of the discourse which follows disappear. But the sixth chapter furnishes the most remarkable illustration of this phenomenon. Mr. Sanday, following the commentators, speaks of the teaching of the Lord contained in it as a long discourse, "addressed . . . to a mixed audience in the synagogue at Capernaum." A closer study of the record will show, as it seems, that there are three distinct audiences (or rather four), three distinct types of discourse, and certainly two distinct scenes. It is quite inconceivable that the Galilean crowd (verses 22, ff.) found the Lord in the synagogue (verse 59), and that the first animated dialogue (verses 26-35) took place there. Again, there is no mention of "the Jews" till verse 41, though they reappear in verse 52. Nothing, then, can be clearer than that "the Jews" are specifically distinct (as elsewhere in St. John) from "the multitude" (verse 24).<sup>\*</sup> The "disciples" appear to have formed a third group, who are specially addressed (verses 37-40); for it will be observed that the objectors in verse 41 go back to verse 35, and take no notice of the more explicit claims advanced by Christ in the verses which follow. It must be sufficient now simply to indicate these constituent elements of the great discourses of this chapter, which really present specimens of (1) the Galilean teaching, (2) the controversial teaching with "the Jews," and (3) the fuller revelations to the disciples. Thus it is that this Galilean narrative, so far from telling against the belief that the peculiarities of the discourses of the Lord recorded by St. John depend on the circumstances of their delivery, really confirms the belief in a most unexpected manner.

This result would be further strengthened if it were possible now to show the individuality even of the open controversies of the Lord in St. John's Gospel, which places them in a peculiar category. This point, however, must be reserved for another occasion; but one subject still calls for notice, where there is less room for difference of opinion.

There can be no doubt that a critical determination of the evangelic texts must precede the critical interpretation of them; and nothing is more surprising than the perfunctory method in which scholars, who spare no pains in dissecting a text, prepare the subject for their experiments. A question of reading, if it happens to be noticed, is treated as if it were an isolated fact, and disposed of either by a mechanical calculation, in which authorities are supposed to have constant (numerical?) values, or by an autocratic judgment on "internal evidence." Mr. Sanday has not yet,

<sup>\*</sup> It is characteristic of Prof. Maurice that he notices and rightly insists on this distinction (*The Gospel of St. John*, pp. 18a, f.).

as he modestly confesses, given time to textual criticism. This is, perhaps, a defect of secondary importance in the present work, but to attempt to deal with the Synoptists (as we trust he will do) without a clear perception of the affinities of the chief authorities and of their cumulative value in different groupings would be little short of courting failure. A single example furnished by the present essay will suffice to make this clear. The omission of the words "neither the Son" in Matthew xxiv. 36, as compared with Mark xiii. 32, is quoted in passing (p. 19) as one of "the principal instances of alterations" [in the common groundwork of the first three Gospels] "made from dogmatic grounds." Now, whatever may have been the cause of the omission of the words in the later copies, there can be no doubt that they were found in the original Greek text of St. Matthew. (Comp. also the false reading of Mark xi. 9, given on p. 194; and the remark on Luke xxiv. 12, p. 259.) But even in St. John, Mr. Sanday wavers, or, in our judgment, errs, as to readings which are of more or less importance. Thus, in iii. 25 he adopts silently the reading *ἰουδαίων* (p. 85), and consequently misses the vivid particularity of the singular *ἰουδαίου*, which is certainly right; in vi. 9 he makes a point of *ἐν*, which is no less certainly spurious; in xiii. 2 an internal consideration is allowed to outweigh the decisive ancient authority for *γινόμενον*; and though the reading in xviii. 24 may, in the opinion of some, be made uncertain by other arguments, it is quite impossible for any one who has studied the combinations of authorities through a few chapters of St. John to say that "there appears to be a nearly even balance of authorities for *οὐν* and against it" (p. 244).

If we have thus frankly indicated some points on which we feel constrained to differ from Mr. Sanday, we trust that he will see in our remarks only a sign of the deep interest and pleasure with which we have read his book. The essay is not only most valuable in itself, but full of promise for the future. Mr. Sanday has proposed to himself a work for a lifetime (preface, p. viii); and we heartily desire that he may be enabled to execute the plan which he has sketched out with the calm, manysided, reverent labour, with the subtlety and sympathy of thought, with the grace and clearness of style of which he has given us the first-fruits. The criticism of the Bible has suffered grievously from haste under the guise of candour; but even when Mr. Sanday's conclusions differ from our own on grave points, we feel that what he has written will in the end be of good service to the Truth, which we have alike at heart. We are at present only on the outskirts of the knowledge of Holy Scripture, and yet we can perceive that the apostolic writings have a message to our own age, which only needs an interpreter that it may satisfy our doubts and aspirations.

B. F. WESTCOTT.

**Le Christianisme et ses Origines.** Première partie : L'Hellénisme.  
Par Ernest Havet. Paris : Michel Lévy Frères, 1871.

M. HAVET is best known by his edition (1852) of Pascal's *Pensées*, rearranging and annotating the text recovered by M. Faugère, and by an article on M. Renan's *Vie de Jésus* in the *Revue des deux Mondes*, published separately under the title *Jésus dans l'Histoire* (1863). In the present volumes, which, he wishes his countrymen to observe, were all but ready before the war, he republishes a series of papers which appeared in the *Revue moderne* and the *Revue contemporaine* from 1867 to 1869 (vol. i. p. xlv). They exhibit the Pagan element in the sources from which M. Havet holds Christianity to be derived, and there is to be another part exhibiting the Jewish element: it will probably (i. p. xv)

bear the second title, *Ancien et Nouveau Testament*. The work will then be complete; for in spite of the principal title, which seems to owe its precise form to the necessity of avoiding a title employed by M. Renan, there is to be no division dealing with Christianity irrespectively of its sources. This is chiefly to be regretted on account of the clearer and fuller view of Christianity in germ which would have been gained by a more first-hand study of it as developed: otherwise the plan is not so defective as might be supposed; for the real subject of these two volumes is independent of all question as to what Christianity is, and would be most accurately stated without using the word at all, as the detailed answer to the question—How much of the theology, religion, and morality, of Western civilisation existed less developed in it before the preaching of Christ? The author would probably accept this account of his programme, but he does not always adhere to it; a strict adherence to it would have excluded much that should rather be classed as Paganism in Christianity than as Christianity in Paganism, and would have cleared his pages of a number of coincidences between the language of the poets and philosophers and the language of the Bible or the "Catechism." We should have missed some epigrammatic points, but have been spared much irrelevant matter.

The subject is not new, and M. Havet does not profess to have much that is new to say about it. At one place (i. p. xxix) he is so modest as to represent his work as a classified collection of materials. But this does no justice to his generally picturesque style, to his well managed transitions and connections, to much thoughtful criticism, and to the warm, if not exactly wide, sympathies which keep the reader in the world of men and not in a world of books. His plan is best explained when he says (i. 4, compare p. 244) that the grand impression of an education of humanity, which a few powerful writers have conveyed in large outlines, he hopes to complete and deepen in his readers by fulness and richness of detail. The general effect approaches that of Mr. Lecky's books.

Unfortunately M. Havet is obliged to confess (i. p. xl) that he has hardly used any foreign works not translated. "J'ai souvent souffert," he adds, "de cette ignorance": yet he hardly seems to see how serious the confession is; especially as the exception in favour of translated books is very scantily represented among his authorities, and his "langues étrangères" turn out to include modern Latin, at least when not written by Frenchmen. This being so, the reader will not be surprised that the treatment of the pre-Socratic philosophy is slight almost to frivolity (i. 29, 43, 99); or that such a question as that of Socrates' belief in immortality is discussed with what can only be called *naïveté* (i. 146, 377); or that the Xenophontean *Apology* is without discussion cited about as freely as Plato's, and employed to correct the testimony of Xenophon's *Memoirs* (i. 147, 377); or that Plato is made without misgiving the author of a coherent system of philosophy (i. 203, and chapter vii. generally); or that the Neopythagoreans are barely touched upon (ii. 142, 234). Perhaps these latter will be handled episodically in the Jewish division. Meanwhile it must be said that there is not too much about the old Pythagoreans, nor much too much about the Eleusinian mysteries (though, as usual, these are too freely used as representing the mysteries generally), and very little about Oriental influences. Only, these things would occupy their proper places still more accurately if the influence of Delphi, which lies on the face of history, had been more conspicuous in the book.

Of the above deficiencies the slight treatment of the pre-Socratic philosophy is not in itself the most important; but

it is the most significant, for it is the first serious symptom that the exposition is to be far too exclusively ethical. Now there is much in Christianity which cannot be brought under the widest definition of ethics. If Diogenes Laërtius or any ancient historian or critic of philosophy had written of St. Paul, he would have been obliged to deal with a large part of the apostle's doctrine under the head of physics. It is, therefore, needless to point out in detail how an examination of the sources of Christianity must suffer directly from such a narrowing of the field. But indirectly this one-sided treatment is connected with something which goes deeper, the excessive value M. Havet attaches to the negative or destructive operation of philosophic progress. He actually believes (i. 121) that if "such men as Diagoras" (whom he seems to take for a philosopher because he is proverbial as an atheist) could have had their own way, a sound edifice of morals, politics, and science might have been established in the fifth century before Christ; only the gods were too strong for us. He says himself (i. 138) that their strength was reinforced by a moral reaction against the license which had been encouraged by destructive criticism, and he knows how to illustrate very happily (i. 351) the natural horror of a theological vacuum. But he does not seem to recognise that unless the unrealities of superstition are replaced by real knowledge, the void is prematurely created. Nothing would have enforced this truth more effectually than a conception of the subject wide enough to embrace its more scientific branches.

At the same time the whole work is written in a polemical spirit, which is the more active cause of this over-valuing of merely destructive work. M. Havet writes the history of theology and religion from a point of view which is certainly antitheological, and which he would not mind hearing called antireligious. It is quite right that a man who occupies this point of view should write the history of theology and religion from it: but the historian ought to sympathize with the theological and religious spirit more than M. Havet does. He has formed his own notion of God, and, without the excuse of believing in its reality, measures by it any theology which comes in his way. If a notion of God does not include for instance a supernatural power of entering into and taking up, as it were, into himself the misery of mankind, it is not a good instrument for dealing impartially with those who suppose themselves to apprehend God under that aspect among others. The most conspicuous instance of M. Havet's unsympathetic treatment of theology (i. 166, on Rousseau's contrast of the death of Jesus with the death of Socrates) would take too long to examine in detail, but it is agreeable to observe that it is also a conspicuous instance of his ready appreciation of spiritual greatness as soon as he is allowed to approach it on the level of humanity. Yet his want of historical sympathy extends further. He has little sense of the spontaneous play of thought and curiosity. He cannot imagine that the paradoxes of Zeno, Protagoras, and Pyrrho, could have had any aim short of undermining Olympus. Generally he seems too fond of attributing an *arrière-pensée* to the earlier thinkers: not the esoteric doctrine which a venerable school of interpretation attributed to them, but something more like the well-bred reticences of modern unbelievers. He does not give Socrates credit, much less Plato, for believing in the existence of the gods. On the other hand, Diagoras having denied it, he resorts to an arbitrary anachronism to account for the audacity of the avowal. The passage (i. 136) is an instructive one, not to the student of the Hellenic sources of Christianity, but to the reader of M. Havet.

It is consistent with all this that the best thing in the book is the force with which it brings out the religiousness

of Greek and Roman philosophy. It is well shown how from the time of Socrates philosophy became constantly more practical, more conversant with morality, sounder in its morality, more the affair of all sorts and conditions of men, more religious, more like Christianity. Accordingly the second volume (for the order of exposition is chronological) is the more valuable of the two. Otherwise M. Havet is happiest where he deals with literature, as in Euripides, or where problems of personal character are concerned, as in Cicero and Seneca. This cannot be said to be the case with his account of Socrates: and Plato seems somewhat to elude him.

If not exactly a critical writer, M. Havet seems accurate in details. His references are full and exact, and his translations are generally good, if occasionally strained. He is less to be depended on beyond the strict limits of his subject; as when he says (ii. 45) we have scarcely any author and absolutely no historian belonging to a period during which Polybius, if he had not begun to write about it, lived, acted, and observed; and less again beyond the widest limits his subject can be supposed to have, as when he summarily corrects Megasthenes (ii. 37) for saying that Indian learning was preserved by oral tradition. Quite within the subject however, and not unimportant, is the misleading statement that the word "salut" or *salvation* comes from the Stoics and not from the Bible. The Stoical *salus*, we need not quit M. Havet to learn (ii. 266 and elsewhere, but see Cicero, *Tusc.* iv. 10, on Chrysippus), is *health*; whereas the *salus* of the Church is *deliverance*, σωτηρία, *y'shû'â*; inasmuch that we read *salus ex inimicis, de manu*, &c. (Luke i. 71). In general M. Havet is disposed to criticize too severely the moral and psychological nomenclature of the Bible. Sometimes what he says comes merely to this, that Semitic languages do not form the close compounds of Aryan languages. To infer that the Jews never formed the conception of idolatry does strange justice to "Isaiah" at least. It may be feared that in the second part of the work, although (to judge by an interesting and powerful passage at the end of the preface) full justice will be done to the moral energy and enthusiasm of the Hebrews, their power of originating ideas will be limited too narrowly.

It is hard to know what to say of M. Havet's opinion on the relative importance of the Pagan and Jewish sources of Christianity. If we are to take him at his word in the preface (vi-viii, xiv-xvi), the Jewish and "Galilean" elements effected the "Christian revolution," but go for next to nothing in fully developed Christianity. Yet it is inconceivable that he should imagine he has accounted in the volumes before us for the vast edifice of Christian dogma, and improbable that he should not think it worth accounting for. But until we possess the other part of the work, all discussion of the question would be out of place: and it is to be feared that in consequence of the author's unfortunate limitation of his subject, such discussion will be almost equally out of place when the work is finished. C. J. MONRO.

#### RECENT WORKS ON WESLEY AND WHITFIELD.

THE works of Messrs. Tyerman, Gledstone, and Umlin, and Miss Wedgwood, on Wesley and Whitfield, cannot be allowed to pass without recognition, though the time for a critical estimate of the subject is perhaps still distant. Differing as they do in purpose and merit, they are an evidence of the change which has passed over the religious press in its way of treating a great spiritual movement. One of them, at least, viz. Miss Wedgwood's, is distinguished by its freedom not only from the prejudices of dogmatism, but from those of a submissive discipleship. The authoress describes her work as—not a biography—but an "attempt to delineate the influence of a particular man upon his age." In accordance with this plan, she

has analysed the various influences which in her opinion contributed to mould Wesley, e.g. his race; the ascetic movement in Oxford; his contact with German mystics among the immigrants whom he met with in his American mission. She attempts to explain the nature of his views, the gradual development of his missionary plans for England, the causes which aided and those which opposed their development. Her sketch is more slight with regard to the perfected system, and to its influence indirect as well as direct. The analysis of influences may perhaps be challenged not so much on the ground of inaccuracy as of incompleteness, while the estimate of Wesley's teaching, if even theologically defective, is at any rate truthful in its general effect. Mr. Tyerman's *Life and Times of Wesley* is a work of far greater pretensions, but fails to satisfy even a moderate literary standard. Offences against good taste are but too common, and we cannot repress the wish that the book may be rewritten and abridged in a future edition. It seems in fact to be mainly designed for the use of the Methodist community, and hence it gives expression to an admiration for Wesley which borders sometimes on the ludicrous. Yet with a rare and commendable frankness it sets forth the great leader just as he was, with his little failings as well as his great virtues. Purely personal matters like Wesley's falling in love and courtship are described with a fulness of detail which reminds one of an ordinary novel. Far be it from us to condemn this amusing particularity. There is nothing in the facts thus revealed disgraceful to Wesley. They relieve the Loyola sternness which is usually ascribed to him; they show him to have been full of tenderness and feeling, capable of loving, and in fact very destitute of worldly wisdom and calculating prudence. On the whole, with all his defects of style, Mr. Tyerman has produced a book of permanent value. Southey's *Life*, checked and corrected by R. Watson's criticisms, must always hold its ground as the classical memoir, and the *Centenary of Methodism* (by the Rev. T. Jackson, a Wesleyan minister) as the best source for a general sketch of Wesley's system; Mr. Tyerman's work will always be a museum to which students will resort for its copious and in great part hitherto unpublished materials for the life of Wesley.

Memoirs of Whitfield were few and out of print, and Mr. Gledstone (an Independent minister, we believe, at Sheffield) has furnished us with a full and sympathetic yet not extravagant picture of Wesley's great rival. There is hardly a sentence which could offend even a secular reader, except one at the end of the volume about "Grace, Grace, Grace;" but Mr. Gledstone is doubtless right in believing that Whitfield himself would have regarded those few last lines as the true explanation of his life. The limited interest felt in Whitfield's biography is due to the temporary character of his work, which was partly overshadowed by that of his coadjutors and rivals. It is the man, what he was, not what he did, which attracts us: and it is this view of him which M. Gledstone has succeeded in presenting to his readers.

Mr. Umlin's modest little book (*John Wesley's Place in Church History*) forms, by its pamphleteering spirit, a curious contrast to Miss Wedgwood's. The object of the writer is to exhibit Wesley as a high-churchman, and to produce the impression that Methodists would fulfil the designs of their founder by reuniting with the church. He certainly contributes some interesting and novel materials towards understanding one aspect of Wesley's mind. There is no doubt that Wesley passed through a state of high-church feeling, and had a slight acquaintance, through the works of the Nonjurors, with some early Christian liturgies. A slight trace of this is now and then perceptible in his later history, but his general views were the reverse, and his work mainly antagonistic. It was not his high-churchmanship which made Wesley the founder of Methodism.

### Intelligence.

The *Ordnance Survey of Palestine* has appeared, accompanied by a letterpress volume, with reports and appendices by the members of the expedition and other scholars.

Dr. Abbeloos, of Malines, and Dr. Lamy, of Louvain, have brought out the first volume of the ecclesiastical chronicle of Bar-Hebraeus (A.D. 1226-1286; see title in full under "Philology"), edited from the MS. in the British Museum, with a translation and historical and geographical notes. It will no doubt supply much important material for the history of the Jacobite and Nestorian heresies.

M. Herder, of Freiburg, a Roman Catholic publisher, has issued a prospectus of a *Cyclopaedia of Christian Antiquities*, to be edited by Prof. F. X. Kraus. A second, corrected, edition of Hefele's *Conciliengeschichte* is in the press.

The *Zeitschrift für historische Theologie*, No. 2, contains a revised edition of the text of Commodian's *Apologeticum*, by Rönisch; and an article on the age of Irenaeus, and the origin of the old Catholic Church, by Lipsius (whose recent remarkable work on the legend of Peter will be reviewed in the *Academy*).

Dr. Pusey has just published a volume of *University Sermons* (from 1859 to 1872).

A new work by D. F. Strauss, *Der alte und der neue Glaube, ein Bekenntniss*, is announced for this month.

### Contents of the Journals.

*Zeitschrift für wissenschaftl. Theologie*, vol. xv. No. 4.—Contributions to the history of the conciliatory form of Pauline doctrine (*Unions-Paulinismus*), by A. Hilgenfeld. [1. The genuineness of Rom. xv. xvi. 2. The Acts of the Apostles and Justin Martyr.]—On the Doxology in Rom. ix. 5, by E. Harmsen.—On Luther's translation of Sirach, by W. Grimm.—On a newly discovered MS. of the Vulgate, by H. Sevin. [A MS., probably of the fourteenth century, now in the possession of Herr da Fay, of Heidelberg. It is complete, except in the first leaf of the New Testament. Extracts and specimen readings are given.]—On the so-called Muratorian Fragment, by A. Hilgenfeld. [1. A connected text of the fragment. 2. A retranslation into Greek, with critical notes. A historical estimate of the fragment in conclusion. Cp. notice in *Centralblatt*, Aug. 10, by R...h.]—Notices: Weiss' *Marcusevangelium*; Keim's and Hausrath's *Histories*, &c., by A. H.; Martensen's *Christliche Ethik*; and Rothe's *Stille Stunden*, by O. Pfeiderer; &c.

*Theologisches Tijdschrift*, July.—History of the Logia-hypothesis, part ii.; by H. U. Meijboom. [Ch. iii. Application of Schleiermacher's hypothesis to Synoptic criticism in Germany. Ch. iv. The opponents of the hypothesis since 1848.]—Marten's *Faith and Works according to the Epistle of James*; rev. by Jungius. [A very able work of a conservative critic, called forth apparently by the equally able work of Blom on the opposite side.]—Bouvier on *Social Progress and the Pastors*; rev. by van Goens. [An opportune address to theological students at Geneva; social questions to be taken up in a practical spirit from a Christian point of view.]—Notices: Waitz' *Anthropology*, vol. vi.; Lenormant's *Essai sur Bérose*; Muir's *Sanskrit Texts*, vol. ii.; Ralston's *Songs of the Russian People*, &c.; by C. P. Title. [Able discriminating notices, which we have not space to analyse.]—Theological periodicals, by A. D. Loman.—Ranke's edition of the Würzburg palimpsests; new part of Field's *Hexabla*; Diestel's edition of Knobel's *Isaiah*; Keil's *Jeremiah*; Martineau's lecture on *The Place of Mind in Nature*, &c.; by A. Kuenen.

### New Publications.

### Science.

Introduction to the Study of Palaeontological Botany.

By J. H. Balfour. Edinburgh: Adam and Charles Black.

PALAEONTOLOGY is far from occupying a satisfactory place in modern scientific work. The services it renders to stratigraphical geology in supplying indications by which the relative age of rock masses can be ascertained encourages palaeontologists to assume for it the rank of a distinct science, to which from a biological point of view it has not the slightest claim. Palaeontology, indeed, stands in much

the same relation to biology that the study of inscriptions and manuscripts does to that of literature—using the word in a wide sense. In either case the student finds the more ancient materials for his work far less complete collectively, and far less perfect individually, than the more recent. In either case, also, without disregarding a certain technical dexterity in interpretation which comes with the familiarity of experience, the full significance of what is ancient will be more likely to be apprehended, and the information drawn from it to be placed in its proper relations, in proportion as a wide and critical knowledge of what is modern is brought to bear upon it. But the study of the records of the past, whether belonging to literature or to the life-history of the Earth, can never, however intelligently conducted, be an adequate end in itself. It is simply to put in order part of the material from which general conclusions will have finally to be drawn.

Unfortunately, however, in many cases the palaeontologist, especially in dealing with fossil plant-remains, has been very little influenced by considerations of this kind. He has been often content to describe name and figure as a distinct organism any fragment which could not be matched with some other fragment already treated in this way. It is no matter, therefore, for surprise to find that in one case portions of what there is reason to believe to have been one and the same plant have been referred to as many as nine distinct genera. The fragments are different simply because they belonged to different organs, or represented the same organ in different states of preservation. A botanist bringing his knowledge of recent plants to bear upon them makes allowance for this, and by a reasonable synthesis unites the *disjuncta membra* into a single and complete organism.

Two hundred years ago it was still held in England that fossil forms were to be explained by a "plastic virtue latent in the Earth." No reasonable person holds such a belief now, or feels any hesitation about admitting that fossil organic remains really belonged to organisms that once lived on the Earth's surface. But in our National Museum our practice is so far behind our theory that instead of the remains of different groups of extinct organisms being associated with those of their recent representatives, in comparison with which they would be most profitably studied, we find them forming a single heterogeneous assemblage, arranged in the same gallery as that in which the collection of minerals is displayed. This is a system which cannot be maintained. Extensive palaeontological collections are not indispensable to the study of stratigraphical geology. The geologist, in fact, is compelled to accept from different naturalists the determination of the organic contents of the rocks he examines, just as he has recourse to the chemist and the mineralogist for his knowledge of the composition of the rocks themselves. On the other hand, the ultimate problem which presses itself more and more on the attention of the student in every branch of biology is to trace out the order which evolution has followed along different lines of organic descent. In studying recent organisms, we hold in our hands the ends of threads which stretch back into the past, if we could only follow them. Too often the threads are broken, lost, or but faintly seen. But the very difficulties which beset the investigation only prove the necessity of bringing to bear upon such traces as exist every means of elucidation at our disposal.

Considerations of this kind naturally prepare us to receive with satisfaction from the hands of an experienced botanist the first English attempt to sum up in an independent treatise the results which fossil botany has achieved. The *Fossil Flora* of Lindley and Hutton, although an exceedingly valuable work, was merely a miscellany of figures and

descriptions, without any attempt at method. But Professor Balfour has aimed rather at giving conclusions than the materials for them, and in this respect his book will suggest a comparison with the *Tableau des Genres de Végétaux fossiles*, published now nearly a quarter of a century ago by Brongniart. Any one who has not kept pace with the very scattered literature of the subject will find his attention drawn in Professor Balfour's pages to almost everything of importance that has been recently published in it. Although in many foreign countries vegetable fossil remains have been the subject of more numerous and more splendid publications, yet it may be fairly claimed that it is with ourselves that the greatest progress has been made in the critical determination of their structure.

Professor Balfour has preferred to describe the vegetation of successive geological periods, so far as it is known, to tracing the history in time of different vegetable groups. No doubt this is a convenient as it is the conventional plan, but it is somewhat deficient in suggestiveness, and certainly opens the way to some misapprehensions. For example, Professor Balfour adopts Brongniart's identification of the Palaeozoic, Mesozoic, and Cainozoic periods in time (including in the last the Cretaceous epoch) with the reigns of Acrogens, Gymnosperms, and Angiosperms respectively. Twenty-three years ago this was not an unreasonable as it was certainly an elegant generalisation. That, in fact, was its defect; neat and sharply defined limits in natural phenomena generally fade away in the light of more ample knowledge. Nine years after the publication of Brongniart's *Tableau*, Dr. Paterson discovered in a bituminous shale near Edinburgh *Pothocites Grantoni*, which has been generally accepted ever since as a monocotyledonous flowering plant. It can therefore no longer be asserted that in the Palaeozoic period the higher Phanerogams were absent. Nor can it be even said that amongst Phanerogams *Pothocites* belongs to a very primitive type. The condensation of its inflorescence and the reduced structure of its flowers imply, on any hypothesis of evolution, the previous existence of flowering plants which had undergone less differentiation. Indeed, for anything that can be positively said to the contrary, there may have been during the Carboniferous epoch a phanerogamic covering to the Earth hardly less varied or less complicated than there is now. Our knowledge of the vegetation of that time is confined to the forests of arborescent Cryptogams fringing the deltas of great rivers. Stems of coniferous trees were occasionally floated down from the higher ground; of the plants that grew with them we know nothing.

Still less can it be said of the Mesozoic period that its fossil remains convey any adequate notion of the contemporary *facies* of the vegetation. The cones and driftwood that occur in rocks of marine formation of this age would have been little injured by immersion in water in which the flowers and foliage of less rigid plants would speedily have decomposed beyond recognition. Such guesses as we can make about the actual vegetation of Mesozoic land surfaces stand in the same relation to the reality as those which a traveller would make in approaching a new country from the ocean, and in collecting the vegetable waifs and strays borne out to sea by currents, do to the estimate which he afterwards forms when he botanises at leisure on the land itself. It is, however, only fair to admit that if arborescent Dicotyledons existed to any large extent anterior to the chalk, it is hardly explicable that we have as yet no evidence from driftwood that this was the fact, except Mr. Sorby's notice of some non-gymnospermous wood from the Lias near Bristol,\* which appears to have been over-

looked. In the "dirt-bed" of the Upper Oolite we have a true land surface, but the ligneous plants of this were undoubtedly gymnospermous. It is far from improbable however that, at any rate, herbaceous Dicotyledons had made their appearance in the Mesozoic period. Monocotyledons, as already pointed out, are certainly known to date from a time still earlier, and in the herbaceous condition Dicotyledons are less different from Monocotyledons than when they become woody. Several facts seem to prove that existing trees are more modern than herbaceous plants belonging to the same groups. They have, for example, more confined ranges, and often represent on oceanic islands, apparently because the exaltation of their stature has had less to struggle against, orders which elsewhere comprise only herbaceous plants. Probably in every group the arborescent habit has been a subsequent development.

It seems, therefore, rather hazardous to speak, as Professor Balfour repeatedly does throughout his book, as if we had any adequate knowledge of the floras of different stages in geologic time, and especially hazardous to institute comparisons between them. The proper function of palaeontological study in relation to biology seems to be, not to attempt to reconstruct pictures of the life of the past, but to compare the structure of extinct organisms with the more recent in order to determine the laws, if possible, which connect the two.

And in this respect, it must be confessed, Professor Balfour's book is somewhat disappointing. That it is really an expansion of a chapter in one of his larger works is an explanation why it should be so; but the somewhat sketchy treatment, which was suitable enough under those circumstances, is unsatisfying in the pages of a separate treatise. There are, in fact, too many lists of mere names—suggestions only of knowledge—and too few detailed descriptions of what the names stand for. A few instances will illustrate this. *Prototaxites*, originally described by Principal Dawson as the oldest existing coniferous wood, is properly referred by Professor Balfour to the *Algae*; nothing is however said of its very curious structure which would explain the bare possibility of such opposite views about it. The stems of ferns from the Coal-measures, Professor Balfour states, "are referred to the genus *Cauleopteris*." But this reference is only a cumbrous way of saying that they are certainly fern-stems, and that nothing more is known about them. The very remarkable fossils known as *Cardiocarpum* were possibly, as Mr. Carruthers believes, Gymnosperms. The suggestion, however, at first sight seems more bold than felicitous, and it would certainly seem to render desirable some setting forth of reasons in its support in Professor Balfour's pages, as well as some expression of his own opinion about it. A very remarkable fossil type—*Bennettites*—is merely said (p. 84) to correspond amongst *Cycadaceae* to *Taxus*, a view which may be disputed if Dr. Hooker\* is right in considering the female flower of *Taxus* as really forming a cone. In any case, it is curious to speculate what amount of information ordinary readers of the book are likely to get from the accompanying figure (pl. ii. f. 3), with no further explanation to aid them than the above remark. Those who know what to look for will find in it sufficient material for reflection; but Professor Balfour's pages do not guide them.

To return to an analogy used already, there can be no advantage in perpetuating a bad reading, whether of a manuscript or of a fossil. It was hardly, therefore, worth while, in the preliminary account of the flora of the Mesozoic period, to insert the obsolete synonyms of various coniferous fossils once believed to be cycadean (p. 78). Moreover, as some of them, *Pinites macrocephalus*, for example, are Ter-

tiary, their introduction in this connection may be even misleading.

Our knowledge of the botany of the Cainozoic period is sufficiently ample to suggest some very interesting problems. One of the most important is the relation of the Miocene European to the existing North American flora. Professor Balfour has possibly regarded the discussion of this as belonging rather to geographical than to fossil botany. Unger, as is well known, struck with the resemblance between the plants which formerly grew in Central Europe and those now found in the Southern United States, especially on their eastern side, proposed the theory of an Atlantis. Professor Oliver\* has, however, shown the much greater probability of the migration having taken place by land connections between North-eastern Asia and North-western America. The Tertiary element in the vegetation of the Old World, which has died out in Europe, seems to increase in strength proceeding eastward towards Japan, where it is at its maximum. A gradual convergence of evidence from other branches of natural history is also tending to establish beyond doubt a former Asiatic connection of the Old and New Worlds.

But with regard to these criticisms, it is only fair to point out that they have been made from an entirely different standpoint to that of Professor Balfour. "There can be no doubt," he says, "that there have been successive deposits of stratified rocks, and successive creations of living beings." But the two things by no means necessarily go together. Changes in the distribution of land and sea produced discontinuities in the sequence of sedimentary rocks. Yet it is impossible to show from geological evidence that the lines of descent amongst organisms have not been continuous. No doubt we have positive proof of their often having come to an abrupt conclusion; but, at the best, nothing stronger than negative evidence can ever be urged in favour of their having had an equally abrupt beginning.

W. T. THISELTON DYER.

#### FATHER SECCHI ON SOLAR DISCOVERIES.

##### TO THE EDITOR OF THE ACADEMY.

SIR,—In Mr. Lockyer's review of my book, *Le Soleil* (Academy, No. 53, vol. iii. pp. 288–290), I find some remarks to which, as they tend to the discredit of my scientific loyalty, I beg you will allow me to take exception.

The book which Mr. Lockyer reviews was written in 1869 and published in 1870. Therefore it is not surprising if he should find my work incomplete as regards contributions made to the science since the date when it was done. Such are those publications of the Kew astronomers which were laid before the Royal Society in March 1870, and others which have appeared in 1871, and even (see the columns of *Nature*) in 1872. Would it not have been at the present date more to the purpose if Mr. Lockyer had chosen for review the German edition of my book (translated by M. Schellen, of Cologne), in which I have made additions increasing its matter to one-half more than that of the French edition? He would not in that case have been able to reproach me with doing less than justice to British astronomers—himself included—and their discoveries. Indeed, I think there is hardly a section in the book which does not mention and appreciate the labours of British astronomers. I cannot be sure of having, in a work of such compass, omitted no single name of those which I ought to have mentioned; but this I know, that I have received thanks and acknowledgments from many quarters in England for the justice which I have done to English science. And I have considered myself honoured by the spontaneous offer of Mr. R. A. Proctor to translate my work for the English reader. This English edition will contain a still further quantity of new matter.

Besides the case of the Kew astronomers, Mr. Lockyer complains that I have not alluded to the thermo-electric researches of M. Henry on the sun; and that I have erroneously put forward as my own.

\* *Trans. Linn. Soc.* vol. xxii. p. 138.

\* *Natural History Review*, 1852.

the division of stellar spectra into three types. Now, M. Henry did not really precede me in this matter. If he advanced any hypothesis before me, as Arago certainly did, still it was I who first brought the subject into the domain of established fact. That I did so, as Mr. Lockyer must surely be aware, was fully agreed in Arago's time (1851).

Neither is my reviewer correct in what he says of Mr. Rutherford's distribution of stellar spectra. Mr. Rutherford's three groups differ radically from mine. He takes his divisions from the general colour of the star, so that in his first group he ranges Capella,  $\beta$  Geminorum, and  $\gamma$  Leonis, which are of my second type; as well as  $\alpha$  Orionis,  $\beta$  Pegasi, which are of my third. The difference is obvious. My divisions are not based on the colours, but on the principal bands of the spectra. Now, I think that Mr. Rutherford entertains no clear distinction of these, and has not proved their constancy in the different stars. Mr. Rutherford's second order agrees with my first; but this is such a natural distinction that I had made it also myself in 1863, before I was acquainted with the labours of Mr. Rutherford. Mr. Rutherford's third group is made up of  $\beta$  Orionis (Rigel),  $\alpha$  Virginis, and others, as being stars supposed to have spectra without lines. Now this is quite mistaken. Accordingly, no valid claim to priority concerning these can be made in favour of Mr. Rutherford; and of the fourth type, which is not less essential, he has no word. Besides, to establish positively the reality of the types in question, it was necessary to examine many more stars than were examined by Mr. Rutherford. And the merit of this examination is exclusively mine.

Again, to test the maturity and soundness of Mr. Lockyer's criticisms, I should like to ask him:—(1) Is there necessarily the contradiction which he says between my propositions that "solar spots are due to eruptions," and that "in the solar spots there are tornadoes and rotatory motions"? Do these two propositions really exclude one another: and if so, was that to be certainly known at the date 1869?

Again, as to Mr. Lockyer's allegation of the *perfect ignorance* which I display with reference to Mr. Balfour Stewart's objections to the theory of the gaseous sun, I should like to ask him:—(2) Is it certain that a gas must always be perfectly transparent, whatever the depth of its stratum? (3) Is it certain that a gas must retain this transparency constant and complete, even at the highest possible temperature which it may reach in the body of the sun? (4) Is it certain that those gases and vapours which by their absorption produce the Fraunhofer lines are perfectly transparent?

To my ignorance it seems that, if all these questions could be positively answered in the affirmative, several received points of solar theory would be in great danger.

Finally, I would by no means be understood as supporting for the exact truth everything advanced in my first edition, any more than my reviewer would himself maintain all his own past opinions on the solar constitution. In this matter *ALIQUID audendi semper fuit aequa potestas*; but also, *hanc veniam petimusque damusque vicissim*.

P. A. SECCHI.

## Notes of Scientific Work.

### Physiology.

**Lymphatics of Mucous Membranes.**—Axel Key and G. Retzius have recently demonstrated the presence of a lymphatic system in serous membranes, and Hjalmar Heiberg has just published a paper showing that a similar system exists in mucous membranes (*Centralblatt*, No. 32). His investigations have been chiefly made on the mucous membrane of the nose of man. The portion employed in the examination was usually taken from the inferior turbinated bone, and was then hardened in alcohol, and stained with gold or carmine. He describes the mucous membrane as being more or less fused with the periosteum, and its *Tunica propria* to be very vascular, so that at the posterior portion of the inferior turbinated bone it forms quite a cavernous tissue. The connective tissue of the mucosa is fibrillar in its deeper part, but becomes more homogeneous superficially, and ultimately merges into the basement or Bowman's membrane. The most superficial layer is often infiltrated with lymph corpuscles. The epithelium is laminated, and the superficial layer is ciliated. The basement membrane, above alluded to, when examined with high powers (Hartnack: ocular vii. objective 3), exhibits many fine vertical striae, which with ocular No. ix. appear as fine tubes destitute of special walls; they vary in number at different points, but are on the whole most numerous posteriorly. In certain regions, however, the basement membrane appears homogeneous, and no trace of the canals can be discovered. The diameter of these tubules varies from that of mere processes of the cells to that of ordinary capillaries; above and below

they not unfrequently widen out and become trumpet-shaped. Lymph corpuscles are visible in their interior, especially in the dilated portion. No apertures are discoverable in the epithelial investment corresponding to the mouths of these tubules. The tubules appear to open into small cavities, of irregular form, lying immediately beneath the *Tunica propria*. In surface sections, the tubules appear as a narrow mesh of vessels lying close beneath the epithelium. A similar structure is exhibited, though less distinctly, by other mucous membranes. Thus, in the trachea and larynx the vertical canals are fewer in number, whilst in the urethra the basement membrane is altogether absent. It has not hitherto been found possible to inject these canals, and their connection with the lymphatics still remains doubtful.

**Note on Recurrent Vision.**—Professor C. Young, of Dartmouth College, U.S., states that in the course of some experiments with a new double-plate Holtz machine he observed a very curious phenomenon. The machine easily gave intense Leyden jar sparks from seven to nine inches in length, and of most dazzling brilliance. When he screened his eyes from the direct light of the spark, in a darkened room, the illumination produced was sufficient to render everything in the apartment perfectly visible, and, what was remarkable, every conspicuous object was seen *twice*, at least, with an interval of a trifle less than one-quarter of a second, the first time vividly, the second time faintly. Objects may often be seen a third and sometimes even a fourth time, but then only with great difficulty. The appearance presented was precisely as if the object had been suddenly illuminated by a light at first bright, but rapidly fading to extinction, and as though during the illumination the observer were winking as fast as possible. Professor Young obtained the best effect by fixing in front of the machine, and at a distance of eight or ten feet from it, a white screen bearing a black cross, with arms about three feet long and one foot wide, made of strips of cambric. That the phenomenon was really subjective, and not due to a succession of sparks, was shown by swinging the screen from side to side. The black cross at all the periods of visibility occupied the same place, and was apparently stationary. The same was true of a stroboscopic disc in rapid revolution; it was seen several times by each spark, but each time in the same position. Professor Young remarks that, whatever may be the true explanation of the phenomenon, it at least suggests the idea of a reflection of the nervous impulse at the nerve extremities—as if the intense impression upon the retina, after being the first time propagated to the brain, were thence reflected, returned to the retina, and by travelling from the retina again to the brain renewed the sensation. He has hence proposed to term it "recurrent vision." Professor Young's paper is published in the *Amer. Jour. Sc.* vol. iii. No. 16.

**Action of Quinine on the White Corpuscles of the Blood.**—A paper appeared in the *Practitioner* for June by Dr. Geltowsky, containing an account of some experiments he has recently undertaken at the Brown Institution of the University of London, to determine the effects of quinine upon the white corpuscles of the blood. He finds that quinine arrests the movements of the colourless globules of the newt's blood if it be used in the proportion of one part to eight or nine hundred. It is remarkable that the globules of the blood of the female resist the action of quinine longer than those of the male. He finds moreover that the globules of the blood of animals already enfeebled by loss of blood in previous experiments resist the action of quinine a shorter time than the globules of animals entirely fresh. The solution of quinine, whether it be in water or in serum, acts with the same force. As regards the solution of quinine in serum, however, it is singular that the movement of the colourless globules ceases in a much shorter time when the serum is not perfectly fresh, although its reaction be neither more nor less alkaline than that of normal serum. The limit at which he finds quinine to stop the movements of the corpuscles is with one of the alkaloid to 2100 of blood. One part to 4000 had no action at all, either with the blood of man or of the guinea-pig. He remarks, in conclusion, that though quinine clearly possesses the power of arresting the movements of the corpuscles, this action can perhaps only be obtained on the stage of the microscope. On injecting into the blood doses which cause the death of the animal, quinine is without effect on the colourless blood corpuscles. Even if the quinine had the same influence on the colourless corpuscles of the blood in the interior of the organism as it has under the microscope, it would still be impossible to explain by the action of quinine on these corpuscles the cure of certain maladies under treatment by this drug, for according to the preceding experiments it is necessary to employ one part of quinine to 2800 parts of the blood of man. This in the case of a man in whom the quantity of blood is from 15 to 20 lbs. would amount to almost one drachm of quinine. In a critique on the foregoing paper in a subsequent number of the same journal, M. Binz, whose observations have thus been confirmed, remarks that it should never be our object to kill the colourless blood corpuscles in the human body with quinine. They are necessary for life, and their death would be our death: all that can be expected or required is that in certain forms of disease in which they are produced in excessive quantity their numbers and their energies should be reduced.

## Chemistry.

**Derivatives of Sulphocarbamic Acid.**—At the Leipzig meeting, Hlasiwetz and Kachler (*Tagblatt*, 116) described the following reaction: When carbon disulphide and ammonia come together in the presence of a third body like camphor, phenol, &c., which merely exercises a catalytic action, they produce very beautiful, large, and nearly colourless crystals of a compound of somewhat unstable character, which is formed in the following manner:

When exposed to a weakly oxidising agent, iron chloride being preferable, this body, which may be regarded as the  $\text{NH}_4$  salt of  $\text{C}_2\text{H}_4\text{N}_2\text{S}_2$ , undergoes the following change:

$2\text{C}_2\text{H}_8\text{N}_4\text{S}_2 + \text{Fe}_2\text{Cl}_6 = \text{C}_2\text{H}_4\text{N}_4\text{S}_4 + 2(\text{NH}_4\text{CNS}) + 2\text{NH}_4\text{Cl} + \text{Fe}_2\text{Cl}_4$   
 $\text{C}_2\text{H}_4\text{N}_4\text{S}_4$  is a body which crystallises in beautiful brilliant scales that are nearly insoluble in cold water, but are decomposed when heated with it into carbon disulphide, ammonium sulphocyanide and sulphur. Aniline gives magnificent prismatic crystals of a corresponding compound having the composition  $\text{C}_{14}\text{H}_{18}\text{N}_4\text{S}_4$ , that can be recrystallised from alcohol, but which with boiling water quickly decompose, giving beautiful crystalline plates of a sulphurea containing  $\text{C}_2\text{H}_4$ , that Hofmann has called sulphocarbamilide:

As regards their constitution, the new bodies appear to be nearly allied to sulphocarbamic acid and sulphurea.

**The Occurrence of Rubidium in Plants.**—It has been found by E. Pfeiffer (*Chem. Centralblatt*, 33, 520) that this metal is present in the ash of the beet-root grown in the north of France, one kilogramme containing on an average 1.75 grammes of the chloride of this metal, or the plants grown on one hectare (2 acres, 1 rd., 35 p.) of land will take up 255 grammes of the chloride of this metal from the soil. The ratios of the chlorides of rubidium, sodium, and potassium in the ash of the beet of this district are as 1 : 126 : 331. Grandeau has likewise detected caesium in these chlorides. While the beet takes up no lithium, the tobacco grown in this district contains potassium, rubidium, and lithium, but only a trace of sodium. The rape grown in this locality contains potassium and sodium, but absorbs neither rubidium nor lithium.

**The Influence of Time on Chemical Reaction.**—Becquerel, in the *Compt. rend.* 75, 52, describes the formation of a number of crystalline bodies by weak chemical reactions extended over long periods of time. In two electro-capillary apparatus containing a solution of lead in potash and one of gold respectively, lead oxide in crystals in one case and metallic gold in the other were formed after a lapse of two years. In a series of tubes hermetically sealed twenty years ago, changes had taken place in their contents developing the following bodies: crystals of arragonite formed from a piece of gypsum in a solution of potassium bicarbonate, the gypsum having almost entirely disappeared; rhombohedra of calcium carbonate; crystals of calcium arseniate that almost rivalled in beauty those occurring in nature (they were produced from a piece of gypsum lying in a solution of ammonium arseniate); crystals of a double salt of calcium and potassium sulphate deposited from solutions of gypsum and alumina in potash; well-developed rhombic crystals of lead carbonate by the action of potassium bicarbonate on galena; hydrated lead carbonate in crystalline scales with pearly lustre by the action of lead oxide dissolved in potash on a piece of limestone; as well as malachite and other products.

**The Ferric Hydrates.**—E. Brescius has endeavoured (*Jour. prakt. Chemie*, 3, 272) to determine the constitution of some of the hydrates of ferric oxide. He examined the hydrate thrown down by ammonia of specific gravity 0.99 from a solution of ferric chloride of the specific gravity 1.01, but it gave no formula. This hydrate is very hygroscopic; when placed over sulphuric acid, it did not give a constant weight till after the lapse of six months. At 100° it begins to lose some portion of the water chemically combined with it. When placed in water for some time, it gradually loses the property of dissolving in acid, and becomes to some extent soluble in water, from which it can be precipitated by the addition of acid. On removing the water mechanically entangled in the hydrate by means of alcohol and ether and with the aid of a Bunsen filter, he obtained a powder having the formula  $\text{Fe}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$ .

**The Gases contained in Coal.**—A number of specimens of English coal have been examined by E. v. Meyer with the view of determining (*Jour. prakt. Chemie*, 5, 407) the amount and constituents of the gases entangled in its mass. The gases varied greatly in amount and quality. In a specimen from the Bewick Main Colliery they consisted of 5.5 per cent. of carbonic acid, 6.5 per cent. of marsh-gas, and 85.6 per cent. of nitrogen. In three specimens from the Wingate Grange Colliery there was much more gas, the mixture consisting of from 85 to 90 per cent. of marsh-gas, 10 to 15 per cent. of nitrogen, and only a trace of carbonic acid. As a rule, the proportion of carbonic acid increases as that of marsh-gas decreases, and in some kinds of coal the occluded gases are condensed into one-third their volume.—More recently Kolbe has published in his journal (*Jour. prakt. Chemie*, 6, 79)

a note on the gases enclosed in the earthy brown coals from Bohemia. They contain no marsh-gas, but from 80 to 90 per cent. of carbonic acid, and an appreciable quantity of carbonic oxide, amounting in one case to 3 per cent.

**The Formation of Transparent Crystals of Salt.**—Mohr showed that salt was deposited in crystals resembling rock-salt by allowing its solution to become supersaturated by very slow evaporation, and inducing the excess to deposit, not at the surface of the liquid, but on the bottom of the vessel. It has recently been noticed by Buchner (*Zeitschrift für Chemie*, vii, 736) that the same thing happens on introducing a hygroscopic salt of some kind into a concentrated solution of sodium chloride. When iron chloride or magnesium chloride is used, the cubes are perfectly transparent, and exactly resemble rock-salt. It is highly probable that the larger proportion of magnesium chloride met with in the mother-liquors of salt-beds may have been an active agent in the deposition of the rock-salt.

**Distribution of Lithium in Vegetable Structures.**—It is stated by Focke (*Abhandl. naturwiss. Vereins zu Bremen*, iii, 270) that when this metal forms a constituent of a plant, it is met with most abundantly in the leaf, in less amount in the parts of the stem or the flower, a few pieces of a leaf often being sufficient to show the reaction. It is present in not inconsiderable amount in species of *Thalictrum*, *Carduus*, *Cirsium*, and *Salvia*, in two varieties of *Samolus*, and *Lathyrus tuberosus*. Many species of plants growing in the same soil contain no trace of lithium. From his examination of the plants that absorb the salts of this metal, Focke has been led to the belief that for certain of them to thrive a supply of lithium is absolutely necessary. A somewhat greater number of plants thrive preferably on soil containing this metal, and take up its salts when possible, although an absence of such compounds seems to cause them no injury.

## Intelligence.

The annual general meeting of the German Geological Society was held during the last week at Bonn.—The Ungarischer Naturforscherversammlung met at the same time at Hercules-Bad, Dr. Kubinyi presiding, with Professors Szabó and Róza as vice-presidents.—The next general meeting of the Austrian Association is postponed to some date next year, while the Exhibition is open at Vienna.—The next Italian Scientific Congress commences on the 5th inst. at Rome.

## History.

**Notabilia from the Papers of Stockmar.** [*Denkwürdigkeiten aus den Papieren des Freiherrn Christian Friedrich von Stockmar.*] Arranged by Ernst Freih. von Stockmar. Brunswick: Vieweg.

THE late Baron Stockmar himself likens his personal action in the public affairs of Europe to that of the sower of the seed. Fostered by kindly outward and palpable influences, the plant grows up; these are taken as the sole agents, and the careful hand which hid the germ in the right spot at the fitting moment goes unrecognised. This condition of his career was, he adds, fully accepted by him, "and," continues his son at the close of the biographical sketch with which the present volume opens, "as Stockmar himself was content with this obscurity before the world during life, this book, true to his own feeling, but slightly raises the veil for posterity." A tantalising announcement! Still in spite of the reticence imposed by filial piety, the succeeding chapters furnish considerable material illustrative of European history from 1817 to 1857, and of the Baron's personal share in the dynastic and political negotiations carried on during that eventful period. And at the same time they furnish the key to the obscure action of so highly gifted and sagacious a politician. As in science he only discovers who proves, so in politics he only gains public credit for statesmanship who through the toil and antagonism incident to public life can achieve the practical recognition of his policy by a nation. For this glorious but arduous career, Stockmar's antecedents, first as the citizen of a minor German state, and afterwards as the political adviser of a minor German prince, afforded no adequate training. And, too, being naturally ineloquent, and unable to master the science of debate, he could never have exercised influence as a public speaker. But, brought into close relations with a prince who could appreciate his single-minded devotion and rare political insight, his natural capabilities developed in a congenial atmosphere, and the *ci-devant* physician ranks in the first order of consulting politicians.

Baron Stockmar's career may be briefly summed up. While acting as head physician to the Coburg contingent, incorporated with the allied armies during the campaigns of 1814 and 1815, he attracted the notice of Prince Leopold, who appointed him his body physician upon his marriage with the princess Charlotte. Upon her death in 1817, Stockmar's deep and affectionate sympathy cemented the bond between him and his royal master. From that day forward he became not only the faithful servant of the house of Coburg, but its most valued adviser and trusted agent. His medical office was soon exchanged for those of private secretary, treasurer, and comptroller of the household, and in 1821 he was ennobled. After 1831, when Prince Leopold accepted the Belgian crown, the Baron acted as his confidential agent in this country. In 1839 he accompanied Prince Albert of Saxe-Coburg to Italy, and in the autumn of the same year King Leopold and Stockmar, who were together at Wiesbaden, received the announcement of the Prince's engagement to Queen Victoria. In the following January he arrived in London to act for the Prince in the settlement of the marriage treaty with the English government. For many years after the Queen's marriage his visits to the English court were long and frequent. He took a final farewell of England in 1857; his latest services to our royal family having been given in aid of the negotiations for the marriage of the Crown Princess of Prussia. His closing years were passed in retirement at Coburg, where he died (1863) in his seventy-seventh year, a few months after King Leopold.

Baron Stockmar was wont to ascribe much of his success as confidant and counsellor of royalty to his medical

training. In 1853 he writes: "My initial study of medicine was a fortunate step; but for the knowledge thus gained and the insight, both psychological and physiological, thus acquired, my *savoir-faire* must often have gone a-begging." It seems to us that his good fortune was in some degree also due to a prudent avoidance, both for himself and his patrons, of all doubtful responsibilities. His refusal to take any share in the medical treatment of the princess Charlotte, and his rejection of office under the short-lived government of the archduke John, are signal instances of this cautious spirit. In both cases the event justified Stockmar's decision. The passages of European history upon which this volume throws special light are the negotiations between Prince Leopold and the five great powers touching the sovereignty of Greece and the crown of Belgium, and also the complicated transactions between the Frankfort parliament and certain of the German sovereigns. The historical student may profitably compare the statements presented by these memoirs—statements, however, strictly limited to the Baron's personal action—with the current histories of these events.

The details and observations bearing upon the affairs of Germany during 1848–1851 merit special attention, and can leave no doubt that a solution of the great problem of German unity was not then practicable amidst the inextricable confusion among the princes and statesmen of that country. Stockmar himself was strongly in favour of a Prussian hegemony; he was for including Austria in the new-formed confederacy, with the exclusion of the non-German members of that empire. Of course the refusal of the Vienna government to entertain such an arrangement, and the rejection of the imperial dignity by King Frederick William IV., together with the humiliation that prince met with at the hands of Austria, proved the futility of the half-measure advocated by Stockmar, and pointed out the remedy against future failure applied by Prince Bismarck in 1866.

The Baron's views upon the British constitution cannot fail to interest English readers. He examines and criticizes our polity exclusively upon one point, the relations between the crown and the parliament, parliament with him meaning the House of Commons. Two principles are emphatically set forth by him, first that the sovereign should act independently of party; secondly, that in all questions touching the interests, the pecuniary interests especially, of the crown, parliament should waive all party considerations to carry out the wishes of the sovereign. Stockmar's constitutional theory is formulated in a paragraph worth quoting; he writes, in 1851:—

"One want especially makes itself felt just now in England; that of able statesmen. Thereby the inconvenience we have suffered since the Reform Bill (of 1832) goes on increasing, namely, the growing omnipotence of the Commons, and its steady encroachment upon the province of the executive. A succession of able premiers alone could check this evil. The broad distinction between a republic and a constitutional monarchy is neither duly propounded nor adequately upheld. Yet its maintenance is the first duty of the minister. It must be brought to bear whenever the Commons, consciously or unconsciously, employ the form of the constitution to jeopardise its spirit, and, unsuspected by the people, to bring the country under a form of government other than its own. Such an attempt on the part of the Commons must be most strenuously resisted by the minister. It then becomes his duty publicly to assert the fundamental maxim: 'You have a constitution which the majority of the people desire to see maintained; and I will never permit a minority like the House of Commons to cheat the majority of the people and rob them of their rights.' . . . It is with a parliament as with a regiment; it is worthless and useless without an able leader—as is the minister, so is the parliament."

Is it conceivable that any English statesman would take in hand to put the precepts of such a political manual into practice? It is noteworthy that Stockmar has not a word to say upon the position and duties of the House of Lords in the British polity. The difference between that assembly

from the ideal of an upper chamber sketched by himself, a body called to its functions by popular election, solely on the score of talent, and with a temporary tenure of office, perhaps explains this conspicuous omission.

Several points of interest in this book must be passed over for want of space, but we must recommend to the reader's notice, as one of its most attractive features, the character sketches of the royal and distinguished persons with whom Stockmar was brought into contact. These portraits, which mark the connoisseur of men and manners, are drawn with a firm and discriminating hand; in some of them, too, a natural correspondence in the personal character of the respective originals with the course and upshot of their political action is distinctly traceable. In one case, however, prejudice seems to have warped the Baron's judgment. Whatever faults a severe critic might impute to Lord Palmerston, no one would now uphold the verdict that so astute and cool-headed a statesman had, at any crisis of his career, "committed so many follies as to justify the suspicion that he had lost his wits." It was Stockmar's belief that an indiscretion of Palmerston had afforded Louis-Philippe and Guizot a pretext for their breach of faith in the wretched business of the Spanish marriages; the English minister was consequently included in the deep-rooted antipathy cherished by the Baron against every one who had contributed to the success of that disgraceful intrigue. The leading circumstances of this business are related, and their mutual bearings pointed out with minute carefulness; more efficacious means could not have been taken to affix an indelible stigma upon the French king and his chief adviser.

GEORGE WARING.

*Oeuvres du Cardinal de Retz.* Tomes I. II. Nouvelle édition.  
Par M. Alphonse Feillet.

THIS edition forms part of the series, *Les grands Écrivains de la France*, published under the direction of M. Ad. Regnier, and, like its predecessors, it aims at restoring an absolutely correct and authentic text, and at exhausting, to all intents and purposes, the work of annotation. Treated in this manner, a bare quarter of the cardinal's *Mémoires* occupies two thick volumes, and the editor's industry is necessarily more conspicuous than his judgment, when the object in view is to communicate, without exception, *all* the information that can be collected respecting the author and his work. There is scarcely a proper name in the text that does not suggest a circumstantial biographical note; parallel accounts by other contemporaries of the same events are carefully compared; the various readings of different MSS. and the early editions are given; and what is still more interesting, we are enabled to follow the author in the very act of composition; for though, of course, the text is based upon the final form of the autograph MS., the critical notes mention if a word is crossed out or a phrase altered or transposed, and might almost serve as a substitute for the sight of the original. Work of this kind is more useful than brilliant, and M. Feillet is not disposed to hazard the completeness of his performance by premature display, for the biographical notice which should have appeared at the head of the *Mémoires* is still delayed, doubtless to enable the author to incorporate anything of interest that may be discovered in the subsequent course of his editorial labours.

There is a general tendency amongst French historians to disparage the political abilities as well as the veracity of de Retz; and in an earlier work, *La Misère au temps de la Fronde*, M. Feillet seems to have shared the common disposition; but M. Bazin is the only careful student of the *Mémoires* who has been able to resist the fascination of their

marvellous cleverness, and their present editor is so far converted as to render quite even-handed justice to his author on all controverted points of fact. His general inferences and final appreciation are naturally reserved for the *Life*; but meanwhile the ordinary reader can form his own opinion *en connaissance de cause*, rejecting those of Retz's statements which are proved to be inaccurate, suspecting, perhaps, those which are unsupported, but relieved from the unsatisfactory impression that everything is untrustworthy alike. These two volumes stop short in December 1649, just before M<sup>me</sup> de Chevreuse arranges the interviews between the coadjutor and Queen Anne, when the intrigue is at its liveliest point, just before the arrest of the princes, an episode that, tried by Retz's peculiar code of conspirators' honour, needs a good deal of explanation. But they include, besides some of the most brilliant writing in the whole work, all that part which is of most importance to illustrate the growth and development of the Retz of history, who finally blends with or supersedes the Retz of autobiographical fiction. It is a curious fact that by far the most impudent of de Retz's inventions, his most unfounded fabrications, relate to the time of his youth and early manhood, before there was any reasonable possibility of his having become as distinguished as he always meant to be and tried to persuade himself he always had been. Up to the *Journée des Barricades* inclusive—and in August 1648 Retz was nearly thirty-five—he had never filled the space in public attention which he held to be his by right; and as he had no intention of posing before the world as one of its unappreciated great ones, he was constrained to persuade himself that the trifling successes, which were all he could claim hitherto, were really straws showing the current that was subsequently to bear him to power and popularity. But when he had actually become the most powerful and the most popular man in Paris (with one exception that could scarcely give umbrage to a reasoning being), he had no motive for systematically perverting the truth; on the contrary, his self-esteem, one of those defects that do half the work of a virtue, would naturally lead him to record with complacent accuracy all that he really did when he was free to do his best, or, as some would say, his worst. For the insurrection which he helped to lead is often condemned as vexatious, merely because it was unsuccessful—an impious rebellion against the fated glories of the Grand Siècle. The touch that troubled the political surface just when the calm waters of absolute monarchy were coming into sight was not precisely that of an angel's wing; nor was the process a healing one. But history, except of recent times, does not necessarily judge by results. While the monarchy flourished, the Fronde seemed an abortive reaction against the central authority in favour of feudalism and anarchy; but when the monarchy had fallen by its own weight, the Fronde, viewed as a premature revolution, might claim to have been before its age instead of behind, and with as good reason. For liberty has always been found attainable by the coalition of two estates out of three; and if the clergy—that is to say, Retz—had been able to negotiate an alliance between the nobility—that is to say, M<sup>me</sup> de Longueville and her allies—and the people—that is to say, the shopkeepers of Paris—it would have been possible to limit the powers of the crown, and perhaps to establish a durable equilibrium in the state. But there is foundation in fact for the contradictory judgments passed on the Fronde, for there were from the first two parties in the anti-Mazarin camp: the coadjutor and the Duc de Beaufort with the parliament representing the popular and revolutionary side, and the nobles with their ancient claims and obsolete ambitions, who were bribed to abandon their allies of the

moment by the promise of a position of unexampled brilliancy in the most brilliant society that had then been known. But the alliance between the crown and the aristocracy was never hearty; it was a selfish bargain, in which both were overreached, the nobles first because it was they who lent to the monarchy the splendour they professed to borrow from it, the king afterwards, because, to purchase the neutrality of a narrow class, he had sacrificed the prosperity of the whole nation. The aristocratic Fronde was certainly ridiculous enough, with its wars and peaces, its treaties and alliances, the mere parody or caricature of serious history, a storm in a tea-cup, *la guerre civile tombée en quenouille*; but, after all, the end of the monarchy was nearly as inglorious as those expiring struggles of an independent military noblesse. Every one knows that the greatness of Louis Quatorze was vicarious, and half of it consisted in this, that during his minority he was the lawful sovereign of some dozen of men and women who were very nearly capable of upsetting a state that had just been fortified by Richelieu.

The motives and interests of the court and the Frondeurs in general were intelligible enough, but Retz succeeded in making for himself a position as singular as his vanity could desire. He was disinterested, not from virtue, but from a natural indifference to the stakes for which ordinary politicians play; he was a conspirator, partly for pure love of the work, partly from the love of fame in its airiest, least palpable shape, the breath of the multitude, not for any material reward, nor to realise a theoretic purpose. He had a few fixed principles of conduct, based on the inner light of a queer conscience, but he had no abstract convictions, no general principles of action, and for want of these his vast energy and versatile ingenuity led to little or no practical result. La Rochefoucauld is supposed to have been thinking of him in the phrase "*Quelqu'éclatante que soit une action, elle ne doit pas passer pour grande lorsqu'elle n'est pas l'effet d'un grand dessein*," and the reflection is more just than most of the same writer's avowed criticisms upon him. His ambition was too exclusively personal for a really great man; he tried to build a reputation that should be its own support, and he would have been jealous even of his own great deeds if he had believed they would serve to distract attention from the brilliancy of his individual character. In his schoolboy day-dreams he fancied himself a Caesar, but Rome was somehow always left out of the vision, and it is not impossible that, if he had been allowed to follow the profession of arms, he might have rested satisfied with uniting the attainable glories of, let us say, du Guesclin or Bayard and—the Chevalier de Lauzun. But he excelled in executing a change of front in the face of adverse circumstances; and when his father, a well-meaning man, whose honest self-deception he laid bare with gentle tolerance, insisted in bestowing upon the church, for the greater glory of God and His servants, the Gondis, "*l'âme peut-être le moins ecclésiastique qui fût dans l'univers*," the young Retz wasted very little time in vain regrets. It may be true, as he tells us, that he fought as many duels as he could, and that he arranged to run away with an heiress, all in order to get rid of the hated *soutane*; but it is more certain that he began to pursue the studies proper to his enforced calling at an age and with a zeal uncalled for in a prelate of family. He dedicated his first *thèse*, according to Tallemant des Réaux, to saints, that he might not have to dedicate it to mundane potentates; but he acquitted himself more than creditably in the eyes of the Sorbonne, was victorious in public disputations, where he confounded an elder adversary out of St. Augustine, and actually took to preaching at all the fashionable churches in Paris.

At this time Richelieu was the model he had in his mind,

and his object seems to have been to rise to such ecclesiastical dignity as would allow of his pretending to the succession of the great cardinal—the archbishopric of Paris, which was a kind of heirloom in the family, being naturally the first stepping-stone to this result. M. Feillet is sceptical as to the reality of the plot to assassinate Richelieu in which Retz professes to have been concerned, but it should be borne in mind that Richelieu's death was a *sine quâ non* of the overthrow of his policy, so that to plan the latter, malcontents were obliged, at least in talk, to contemplate the former. At any rate, Retz's was amongst those ambitions that were disappointed by Louis XIII.'s unexpected fidelity to the counsels of his departed master; Mazarin was retained in power, and short as was the time accorded him by the king's illness, he put it to such good use that, when the new reign began, he was already master of the confidence and affections of the queen-regent. Retz would fain have superseded him in both, but it was too late; Anne was constant where a wiser woman would have been false on principle to all such politic gallants; and it is very doubtful whether, of the two candidates for her favour, she chose either the most able or the most virtuous. Both were clever, both were unscrupulous; neither had a large scheme of foreign or domestic policy, but Retz was a Frenchman and personally disinterested; his undoubted talents would have gone further in office than in opposition, and as inclination would have led him to make the regency a popular government, it would have been necessary to revive the traditions of the good old times of Henri Quatre. Mazarin was honestly desirous to carry on the policy of Richelieu, who is commonly supposed to have completed that of Henri, but there is one important difference between the two, for Richelieu's policy had no domestic aims, whereas Henri's had the prosperity of France, and the foreign policy, which with the latter was only a means to the other result, was by the cardinal made subordinate to the aggrandisement of the monarchy as such. In this spirit Mazarin records in his private note-book the reflection that to bring the affairs of France to the highest point of prosperity, it is only necessary "*que les Français soient pour la France*;" the parallel necessity, "*que la France fût pour les Français*," was not likely to occur to an alien adventurer. "Interest of state" with him means interest of statesmen, and he so far identified his cause with that of his royal mistress that in the *Carnets* he seems to have been unfeignedly surprised and hurt at the opposition of which he was the object. The effect is comical; we seem to hear Reynard the Fox bemoaning himself (in very bad French) because the hens and chickens do not approve of his appointment as prime minister.

The coadjutorship of Paris was a slight consolation to Retz for the disappointment of hopes that were not altogether unreasonable in themselves. The *Mémoires* are not to be relied upon implicitly for this period, during which, to keep himself before the reader, he gives undue importance to certain squabbles about precedence, in which he claims to have upheld the rights of the church and the see of Paris against all manner of powers and principalities. But these misrepresentations cover a background of fact, for the favour of those of his cloth was always one of the strings which the coadjutor kept in reserve for his bow. Despite his scandalous life, his old tutor Vincent de Paul had been heard to say of him that he "*was not far from the kingdom of heaven*:" "*j'estimois beaucoup les dévots; et à leur égard, c'est un des plus grands points de la piété*," is his own account of the matter; and he would have been perfectly in his element, if the circumstances of his age had been suitable, as the leader of a popular clerical opposition to the secular powers. Too late for this rôle, he was too early to

put himself at the head of a merely democratic movement, for besides that such a movement would have had to be half created, he distrusted the populace while bidding for its favour, and he disliked the thought of associating on equal terms with middle-class revolutionaries like Cromwell, whose first overtures he peremptorily declined. Yet in theory he thoroughly understood what was needed to make a successful revolution, and in practice he resolutely refused to commit high-treason unless the parliament would be a party to the act. The *gros bourgeois*, the citizens *en noir*, were the men he trusted, and whose support he valued, but they are just the men who will fight for an idea; not driven by pressing necessity like the mob, nor by insatiable appetites like the nobility, they could command both time and prudence, they only wanted a cause, and that Retz could not give them; but he may certainly claim the merit of having made the causes of his failure more intelligible than any other writer has done. The passage in which he describes (and probably antedates) the arts that founded his popularity with the class next below this is one of the most curious in the *Mémoires*. M<sup>me</sup> de Maignelais, his aunt, was a *dévot*e, and one of the charitable ladies who shared in Vincent de Paul's labours for the succour of the distress which was becoming a serious danger to the state. Through her agency Retz distributed large sums that were entrusted to him for political purposes amongst the virtuous poor of Paris, not the professed mendicants, but those whose praise was rather creditable to a churchman, especially while they and he kept the secret of how it was earned. The children were not neglected: "je connaissais Nanon et Babet;" and the delighted aunt never failed to dismiss her *protégés* with the injunction, "Priez bien Dieu pour mon neveu; c'est lui de qui il lui a plu de se servir pour cette bonne oeuvre." In the faubourgs of Paris in 1652, we are told, there were 12,000 families of respectable poor in distress, besides beggars, and if only half these were amongst the coadjutor's clients, his power is easily explained. Condé tried at one time to arm the most desperate amongst them, but he could neither control nor utilise them as soldiers, and before the end of the civil war the horrors which it added to those already existing had the effect of converting the poor, and the inferior clergy who were nearest to the distress, into Mazarinists or partisans of peace at any price.

Retz had no right to complain of their defection, because he had expressly declined the part of tribune of the people; to borrow his favourite metaphor, history is a comedy, and he preferred to perform before an audience in full dress. But before sinking to the level of a mere factious partisan leader, he had one more combination to propose, which is enough by itself to mark him as the equal of Mazarin in the shift turns and tortuous tricks of statecraft. A civil war in France was incomplete without the Spaniard; the two countries were at war in 1649, but M. de Longueville, "qui avait déjà été de quatre ou cinq guerres civiles," and the aristocratic Fronde attached little importance to that circumstance, and were anxious to treat at once with the invader. Retz's exposition of the dangers and drawbacks to such a course is the more masterly because he disdains the support of vulgar moral and patriotic prejudices. The popular cry of the day was, "La paix et point de Mazarin;" by adopting this platform the Fronde assumed an intelligible attitude towards the court, and Retz hoped to succeed in committing the parliament to it as an ultimatum. The Spaniards were willing to accept the offer of mediation; by refusing it, Mazarin was expected to put himself more than ever in the wrong with the country. Turenne was ready to march to the support of the parliament, Paris was in the mood to rise as one man, fetch back its young king, and

instal the coadjutor as his prime minister. If, on the other hand, matters did not proceed to extremities, the parliamentary and other Frondeurs would have achieved a great diplomatic triumph, and the country would have been pacified by their efforts; Mazarin must have disappeared, and the conduct of the government would naturally have passed into their hands. The timid loyalty of the parliament and sudden defection of Turenne's army, even more than the impracticable demands of the nobles, ruined this promising scheme, and Retz, with the elasticity of mind that characterized him, set to work undismayed to frame fresh schemes to save his own popularity with the masses, while he secretly encouraged his allies to make favourable terms for themselves at court.

It is unnecessary to speak of the ever fresh interest which his art lends to the story of all these contemptible intrigues; he may have altered a little here and there, but nothing but nature and life could have the variety, the intricacy, of the pictures that crowd his pages, and nature and life are dull and obscure as compared with this brilliant paraphrase and commentary on their secrets. The only reservation to be made with respect to his general trustworthiness for this period is that suggested by La Rochefoucauld: "Il a une grande présence d'esprit, et il sait tellement tourner à son avantage les occasions que la fortune lui offre qu'il semble qu'il les ait prévues et désirées." But this very fertility of resource may have helped to deceive his critic into believing him more *malin* than he really was. His candid enthusiasm for himself kept him back from many falsehoods if it led him into a few, and we have no difficulty in accepting Saint-Evremont's statement: "il découvrit le fond de son âme à ses amis" (amongst whom La Rochefoucauld was never reckoned) . . . "jamais courtisan ne fut moins dissimulé et plus sincère." His pride was of that magnificent kind that only condescends to show itself to superiors; his disinterestedness was partly pride, partly real indifference, and only served incidentally for ostentation. In person he was abstemious, awkward, absent; there was a large element of fantastic romance in his character which is quite lost sight of by the ordinary moral historians, who treat him as a mere vulgar firebrand or *brouillon*. In the civil discords he was scrupulous in adhering to the rules of the game as he understood it; he was entirely free from malignant passions, and, though it is almost a paradox to say so, considering his opportunities, he did singularly little harm either to individuals or the state. Some of the good that he might have done was lost by his own fault, some by fortune, who was not on the whole propitious to him; but his public life was not that of a bad or mischievous man. His personal character is too complicated to be dismissed in a paragraph, except by such a master of portraiture as himself; but the doubts which the *Mémoires* suggest are such as we expect the last years of an ambiguous life to solve, and we know that Retz died as he had lived, popular, amiable, and still notorious, for the whim had taken him to devote his princely revenues to the discharge of his still more princely debts.

M. Feillet has a new theory to suggest as to the lady to whom the *Mémoires* are professedly addressed. M<sup>me</sup> de Caumartin, who is generally supposed to have that honour, was not on very intimate terms with the cardinal, though it is probable that the MS. was shown to her husband, and M. Feillet even conjectures that some notes on an extant MS. copy may be from his hand. But the *Mémoires* were evidently written for posthumous publication, not for the private amusement of any individual, and if they were addressed in imagination to a lady who might never read them, why is M<sup>me</sup> Caumartin to be she? Why not M<sup>me</sup> de Sévigné, whose letters are full of friendly admiration for

"notre cardinal," and hopes that he may be persuaded some day to write the history of his life? Direct evidence is perhaps out of the question, but M. Feillet succeeds in showing in most cases where Retz adds to a name, So and So, "whom you know," "whom you visit," that the individuals mentioned are amongst M<sup>me</sup> de Sévigné's acquaintances. Several other interesting questions are discussed in the notes and introductions, such as the date of the composition of the *Mémoires*, and whether Retz was nineteen or twenty-nine when he wrote the *Conjuration de Fiesque*; but the latter point will be treated more at length when the editor comes to the turn of that Machiavellian little pamphlet. We shall look anxiously for a fresh instalment of his conscientious and interesting work.

H. LAWRENNY.

### Contents of the Journals.

G5tt. gel. Anzeigen, Aug. 7.—Reviews Nippold's interesting book, *The Old Catholic Church of Utrecht*; and Liebrecht compares the stories in Grundtvig's *Danish Popular Tales* with similar ones in other countries. —Aug. 14.—Contains an appreciative notice of Tylor's *Primitive Culture*.—The publication of the first volume of Pertz's *Diplomata Imperii* (the Merovingian times) has called forth some reviews of books on the same subject, such as Bresslau's *Diplomata centum in usum scholarum diplomaticarum* (Aug. 28), and Gegenbaur's *The Monastery of Fulda in Carolingian Times* (Sept. 4). Pertz's national work contains 224 documents, 121 being genuine and 103 forged—the forgeries being as usual in the interest of the great ecclesiastical bodies of St. Denis, Le Mans, Treves, &c., just as the forged Anglo-Saxon charters are due to Malmesbury, Peterborough, &c. Historical students would be glad of such a handbook to English charters as Bresslau's is to German. A number of characteristic specimens, with sufficient explanations, is what is wanted: e.g. the knowledge of the continued use of the Greek Indictions (Sept. 1–Aug. 31) in papal documents down to A.D. 1087 shows us that a document should be dated in 811 instead of 812.—There is also a notice of Jähn's interesting book, *Ross und Reiter*. —Aug. 21.—Reviews August Baur's *Deutschland in 1517–25* (illustrated from the popular literature and pamphlets of the time). —Aug. 28.—Notices Brandes' *History of the Church Policy of the House of Brandenburg*; and gives a brief account of the globe at Vienna with the name "America" on it, which is valuable in reference to early geographical treatises on the New World. —Sept. 4.—Geiger controverts the view expressed in Küchelmann's *Johannes Sturm, Strassburg's erster Schuldirector*, that Sturm was one of those who led the advance of education; it is shown that he rather belonged to the reaction in the sixteenth century. —Sept. 11.—Contains a long review by Pauli of Stockmar's *Life*, so interesting to English readers from its frequent references to the princess Charlotte and our present Queen, and the state of English society and politics.

### Philology.

*Grammaire hiéroglyphique*, contenant les Principes généraux de la Langue et de l'Écriture sacrées des anciens Égyptiens, composée à l'usage des Étudiants par Henri Brugsch. Leipzig: J. E. Hinrichs.  
*Index des Hiéroglyphes phonétiques y compris des Valeurs de l'Écriture secrète et des Signes déterminatifs qui se rencontrent dans le Système graphique des anciens Égyptiens, composé et appliqué à son Dictionnaire hiéroglyphique* par Henri Brugsch. Leipzig: J. E. Hinrichs. (Extrait de la *Grammaire hiéroglyphique*.)

M. BRUGSCH's work contains twenty chapters, one of which treats of the System of the Hieroglyphic Writing, fourteen of the Forms, and four of the Syntax. Two most important treatises are appended to it: (1) "A General Table of such Hieroglyphs as have Phonetic Values;" (2) "A General Table of the General Determinative Signs which are most used in the Hieroglyphic Writings." These tables, extracted from the bulk of the work by M. Brugsch, have been published separately with the title of *Index of the Phonetic Hieroglyphs, &c.*, so that the two books inscribed at the head of this review are in fact but one, the second being contained from beginning to end in the first. It is almost unnecessary to say that a work from the pen of M. Brugsch contains a vast amount of science and well-founded observation: indeed the author of the *Demotic Grammar, Geographical Inscriptions, and Hieroglyphical Dictionary*, has once more proved true to himself. I therefore can make no pretence to analyse minutely or sufficiently so new and so complete a book. I must content myself with quoting at random some of the observations my own studies have suggested to me about it.

And first, it seems to me that M. Brugsch has been somewhat misled by the idea that he was making a grammar à l'usage des étudiants. The beginner in the hieroglyphics is generally a man well versed in classical studies, and not devoid of philological notions: he knows Hebrew and Coptic more or less, and needs not the merely empirical grammar we are used to put into the hands of common beginners. Now M. Brugsch's grammar is merely empirical: instead of arranging his matter according to the peculiar genius of the tongue, he has arranged it according to the laws of the classical languages, and so tried as it were to force it into clothes which are unfit for it. Thus, although he is one of the few Egyptologists who are conversant with Coptic and Demotic, he has neglected those two forms of the Egyptian. Once only, in speaking of the verb, he expresses his ideas about the formation of the roots; and, from the few words he says there, we may easily gather what great results he might have realised had he thought proper to apply his attention to the investigation of origins.\*

The great majority of Egyptian roots are biliteral, that is to say, include two radical letters which are sounded as one syllable, and no more: s<sup>m</sup>, to hear; q<sup>b</sup>, to refresh. The two radicals are not necessarily consonants: H<sup>â</sup>, to stand; A<sup>â</sup>, to be great; i<sup>û</sup>, to go; t<sup>â</sup>, to cry, contain either one consonant and one vowel or two vowels forming a diphthong. In the course of time these primitive roots underwent modifications by which the number of their constituent letters was raised from two to four, and then to three; indeed, most of them have got a whole retinue of quadriliteral and biliteral roots which are derived from them and possess the same value.

There are two means of modifying a root: (1) by repeating it; (2) by adding to it auxiliary letters.

1. Repetition is the simplest manner of increasing the sense of a root; and, therefore, in Egyptian, as well as in

most languages, radical repetition is sometimes intended to mark an increase of the action. Q<sup>n</sup>N, *to beat*, develops itself into Q<sup>n</sup>NQ<sup>n</sup>N, *to give somebody a sound thrashing*. But this is rarely the case: repetition ordinarily is a modification of the word without any modification of the idea. S<sup>n</sup>NS<sup>n</sup>N, *to breathe*, B<sup>n</sup>NB<sup>n</sup>N, *to spring*, have no more value than S<sup>n</sup>N, B<sup>n</sup>N: they are both of them mere variations of the words, corresponding to no particular shade of variety in the fundamental thought. The sole difference between them is that S<sup>n</sup>N is a monosyllable, while S<sup>n</sup>NS<sup>n</sup>N is a dissyllable, which goes against one of the most decided tendencies of the tongue, being that each root counts for one syllable. To overcome that difficulty, the Egyptians had no resource left but to drop one of the three last radicals, the first being always respected. Thus, Q<sup>n</sup>BQ<sup>n</sup>B becomes Q<sup>n</sup>QB, by dropping the second radical; Q<sup>n</sup>BB or QB<sup>n</sup>B, by dropping the third; Q<sup>n</sup>BQ or QB<sup>n</sup>Q, by dropping the fourth; so that each biliteral monosyllable, being raised to the square, turns out to be the common stock for three trilateral monosyllables, all of them signifying the same thing.

2. Some of the auxiliary letters get intercalated between the radicals, apparently in order to raise the root from its biliteral to the trilateral state. The dentals *t'* and *z'* are rarely used for this purpose, and I know of no guttural employed for it. The most of the remaining letters are apt to play the part of first (a), second (b), or third (c) radical, according to the place in which they are set.

(a) The aspirates *a*, *h'*: Q<sup>n</sup>B, *to refresh*; Q<sup>n</sup>M, *to find*; B<sup>n</sup>N, *to spring up*, give AQ<sup>n</sup>B, AQ<sup>n</sup>M, H<sup>n</sup>B<sup>n</sup>N. (b) The dentals *t*, *d*, and, sometimes, *t'*, *z'*: S<sup>n</sup>M, *to hear*; N<sup>n</sup>M, *sweet*, give S<sup>n</sup>TM, N<sup>n</sup>TM, or N<sup>n</sup>z<sup>n</sup>M. Then every root of which the last radical is a consonant has, besides its primitive form, a nasal form, the *n* of which is suffixed to the first radical and prefixed to the last: S<sup>n</sup>D, S<sup>n</sup>T, *to tremble*, give S<sup>n</sup>ND, S<sup>n</sup>NT. (c) The aspirates *h'*, *χ*: Q<sup>n</sup>B, Q<sup>n</sup>BH<sup>n</sup>; D<sup>n</sup>B, *to pray*, D<sup>n</sup>BH<sup>n</sup>; S<sup>n</sup>B, *a door*, S<sup>n</sup>Bχ; AB, *to rise*, to *penetrate*, ABχ. The nasals *n*, *m*: M<sup>n</sup>AD, *way*, give M<sup>n</sup>TN; H<sup>n</sup>B, *χ*B, *to plough*, H<sup>n</sup>BN, *χ*BN; *χ*T, *to seal*, *χ*TM; the additional *n* may be doubled thus: M<sup>n</sup>TN, M<sup>n</sup>TENNÜ, H<sup>n</sup>BN, H<sup>n</sup>B<sup>n</sup>NNÜ. In a root of which the second radical is a nasal, when the last happens to be a dental *d*, *t*, *t'*, or *z'*, the intercalated *n* attracts a *nü* final as if it were the last radical, and the dental being assimilated, disappears from the writing as well as from the pronunciation: thus, S<sup>n</sup>WT (*√w<sup>n</sup>d*), *to suffer*, becomes S<sup>n</sup>W<sup>n</sup>ND or S<sup>n</sup>W<sup>n</sup>NT and S<sup>n</sup>W<sup>n</sup>NNÜ; *χ*NT, *to run up a river*, *χ*NNÜ.

The remainder of the auxiliary letters possess a grammatical value. *s*, *d*, *r*, and *m* (*mâ*), prefixed to the root give to it a causative signification: H<sup>n</sup>N, *to incline*, become SH<sup>n</sup>N, D<sup>n</sup>H<sup>n</sup>N, R<sup>n</sup>H<sup>n</sup>N; H<sup>n</sup>Â, *to stand*; SH<sup>n</sup>Â, *to raise*. Three of these letters may be traced up to roots still living in the tongue: *r* to ARĪ, *to do*; *d* to DÛ, and *m* to MÂ, *to give*: the origin of *s* is unknown.

Besides these absolute forms, a careful analysis of the texts enables us to affirm that there is in the old Egyptian something analogous to the construct state of Semitic philology. Every root biliteral or trilateral may accept the suffix *t*, vocalised often *ât* or *tâ*: M<sup>n</sup>R, *to love*, M<sup>n</sup>RT, M<sup>n</sup>R<sup>n</sup>T, M<sup>n</sup>RT<sup>n</sup>. Until now this has been considered as denoting exclusively the passive of the verbs: M<sup>n</sup>R, *to love*; M<sup>n</sup>RT, M<sup>n</sup>R<sup>n</sup>T, M<sup>n</sup>RT<sup>n</sup>, *loved*. But it is used in many places where it cannot possibly have an intransitive value; in *Papyrus Abbot*, *At-â-u gim-rû-w m asâ*, the text does not admit of a passive translation, "He was found guilty," but only of an active one, "They found him guilty." Then *ât*, *tâ*, occurs at the end of such words as ARĪT, *an eye*; DÛT, *a hand*; H<sup>n</sup>ÂT, *a beginning*, *a chief*, which it is impossible to view in the light of passive formations (*Pap. Anastasi*, ii. 6, 2): *âbex-t art-tû-k er seb nû pet*, "Thy eye shines more than a star in the sky." That its adjunction was entirely facultative, and did

not alter the signification of the roots, is proved by variations of the same text in which one manuscript gives the absolute state of a word, while another has the construct state of the same. Thus, taking for instance the above-quoted passage in *Papyrus Anastasi*, ii. 6, 2, we have *art-tû-k*, and in *Papyrus Anastasi*, iv. 5, 10, *art-ek*. If we pass from the older texts to the newest ones, we find: (1) that the construct state of hieroglyphical times is extant in Coptic *μωε*, *to be born*, construct state *μαστ* . . . &c.; (2) the old roots have for the most part two Coptic forms, the one responding to the absolute state of the root, Coptic *HA*, *a chief*, from Egyptian H<sup>n</sup>Â, the other responding to the construct state of the same, Coptic *hover*, *the first*, *the chief*, from H<sup>n</sup>Â-tû. Thus it is that we are able to reject the last remnant of Champollion's theory concerning the graphic expletives. The *t*—written, now with a mere segment of the circle *⦿*, now with a segment of the circle and a perpendicular line—which follows *ad libitum* almost all the words, and has been mistaken for an expletive, is, when not a feminine mark, a mark of the construct or emphatic state we have pointed out. Its origin is evident: it comes from the essential verb *tâ*, which helps to form the tenses. Suffixed to a root, it adds an idea of being and reality which transfers it from the abstract to the concrete state, and enables it to receive grammatical particles, or to play its part in the general construction of the phrase.

Egyptian roots are not, properly speaking, nouns, adjectives, or verbs: they express the idea independently of grammatical category, and may, according to their relative position, play the same part that nouns, adjectives, and verbs, play in our modern languages. Thus, *√ââ* may signify *great*, *greatness*, *to be great*; S<sup>n</sup>M, *to hear* (*to obey*), *obedience*, *obedient*, and are therefore not definite nouns, adjectives, or verbs, but only possibilities of nouns, adjectives, or verbs. Their grammatical category resides not in their material form, but in the mind of him who speaks or hears. Hence it comes that the Egyptians possess nothing which we may say corresponds exactly to our declinations or conjugations. By dint of personal pronouns affixed as signs of the subject to the roots of appellative value, they contrived to build small phrases M<sup>n</sup>R-A, M<sup>n</sup>R-K, by which they devolved the possession of the idea expressed by the root upon one of the three persons, but without creating any definite grammatical category. M<sup>n</sup>R-A, M<sup>n</sup>R-K, signify, after a general fashion, *love-o' mine*, *love-o' thine*; but we were not right to interpret them, when taken isolatedly, by *I love*, *thou lovest*, more than by *my love*, *thy love*: it is only their position in a sentence which determines the special value we are obliged to give them for the nonce, and enables us to see whether they are to be rendered by one of our substantives or by one of our verbs. M<sup>n</sup>R-A AT<sup>n</sup>W-A is translated: "I love my father," and we say that M<sup>n</sup>R-A is the first person of a verb the regimen of which is AT<sup>n</sup>W-A. But M<sup>n</sup>R-A and AT<sup>n</sup>W-A are two locutions constructed on exactly the same pattern, and which, when isolated, express the attribution to the first person of the general ideas *love*, *father*; being united in the same proposition, they become the two terms of an equation, M<sup>n</sup>R-A = AT<sup>n</sup>W-A, *Love-o' mine = Father-o' mine*, where the relative position of the factors induces us to bestow upon M<sup>n</sup>R-A the quality verb, *I love*, while in another equation MÂÂ NÛT<sup>n</sup>R M<sup>n</sup>R-A, *God sees my love*, we would be obliged to give it the substantive value of *my love*. M<sup>n</sup>R-A, being alike a substantive or a verb, may, in its verbal impersonations, denote the past as well as the present, and the future as well as the past. The Egyptians contented themselves with indicating the fact of the action being done, and with naming the doing person; they left to the hearer's or reader's mind the care of ascertaining, according to the tenor of the phrase, the moment of

duration in which the action is, has been, or will be present.

To remedy the inconveniences resulting from such a system, they used a number of auxiliary words which, being set before a root or after it, but without ever being blended into it, limit its extension. Four roots, *a, p, t, n*, when vocalised with *û*, into *Aû, Pû, Tû, Nû* [= *ûN*], were considered in the light of auxiliary verbs, and, when vocalised with *â*, into *Pâ, Tâ, Nâ*, become the articles *the (le), the (la), the (les)*: so it was enough to see a root preceded by an *û*-form to be sure that it was endowed, for the nonce at least, with the value of a verb, or to see it preceded by an *â*-form to be sure that it was endowed, for the nonce at least, with the value of a noun. *Tâ Z'D-A*, or *Tâ<sup>1</sup>-A Z'D*, signifies "my word;" *Tû Z'D-A*, or *Tû<sup>1</sup>-A Z'D*, "I speak;" *Nâ AR-A*, or *NA<sup>1</sup>-A AR*, "my deeds;" and *ûN AR-A*, *ûN A AR*, "I do." Every auxiliary verb may be combined with the personal pronouns after three different fashions, the subject being affixed (1) to the sole auxiliary *Aû-a M<sup>r</sup>*, *I am the fact of loving = I love*; (2) to the sole verb *Aû M<sup>r</sup>-A*, *is my loving = I love*; (3) to the auxiliary and to the verb *Aû-a M<sup>r</sup>-A*, *I am, I love = I love*. If you multiply those three forms by the number of the above-mentioned auxiliaries, *pû* being excepted; if you remember that in the course of time some verbs *χOP<sup>r</sup>*, *to become*, *H'Â*, *to stand*, *MÂK*, *to mind*, become auxiliaries too, you will conceive easily how it is that we find in the texts an almost incredible quantity of verbal locutions which are not distinct tenses, but distinct forms of one tense identical to the indefinite tense of which I have spoken already.

Thus, the great quantity of verbal forms and, for all that, the complete want of precise tenses and moods, are the two capital faults with which the Egyptian tongue had to grapple, and which it never succeeded in rejecting entirely. From the auxiliary *ûN* [= *Nû*] derived the participle *N*, which, being placed between two words, denotes: (1) a state in which the idea expressed by the first word is assimilated to or made dependent of the idea expressed by the second: *ûN-n-AMEN*, *The being WHICH IS Ammon*; *ûN-n-A*, *The being WHICH IS me, Ammon's being, my being*; (2) the past tense *ûN-n-A*, *I was*, *Z'D-n-AMEN*, *Said Ammon*. A past thus formed differs from the present, not in signifying a possession of the verb by the subject, since *M<sup>r</sup>-A*, *I love*, implies also an idea of possession, but in marking the possession more strongly that the present marks it, *M<sup>r</sup>-n-A*, *Loving WHICH IS mine*, insisting on the idea of possession more pointedly than *M<sup>r</sup>-A*, *Loving o' mine*. Hence it is that the distinction between the two tenses is frequently overlooked, and that *M<sup>r</sup>-n-A* signifies oftenest *loved*, yet often also *I love*, or *I will love*.\* So between the auxiliary and the verb they intercalated prepositions which design the direction of the action *H<sup>r</sup>* towards the present and the past, *\*R* towards the future: *Aû-A H<sup>r</sup>-A M<sup>r</sup>*, *I love, I loved*; *Aû-A-R M<sup>r</sup>*, *I am to love, I will love*, although the *\*R* form is employed often for the past or the present. In the language of the Demotic texts, the *n*-past and the *H<sup>r</sup>*-conjugations fell out of use, and the conjugations with auxiliary verbs were almost always reserved to the expression of the past. In Coptic, the tense which results from the suffixion of personal pronouns to the root disappeared almost entirely: the auxiliary *tû* and certain forms of the auxiliary *aû* marked mainly the present, while other forms of the same were used mainly to mark the past. However, in Demotic and Coptic, as well as in the language of older times, we find the most perplexing indecision in the manner of rendering the relation of tense: the verbal forms showed a tendency towards a tense, but were not definite tenses.

CHAPTER II.—*The Substantive*.—M. Brugsch has adopted with reason the views of M. Lepage-Renouf about the feminine of the nouns,\* and considers the *t*-ending as a *phonetic* sign of the feminine. To M. Lepage-Renouf's testimony I am able to add a proof deduced from the analogy of the Coptic language. In Coptic, the feminine of the nouns is shown by an *-i* (*M.*) or *-e* (*T.*) ending: *σov*, *brother*, *σove*, *σovi*; *βωκ*, *servant*, *βωκi*. Now, the feminine pronoun of the second person, which is written in Egyptian *-t*, *\*T*, lost in Coptic its final *-t*, and became *-e*. I think the same process which deprived this pronoun of its *t* deprived the nouns of theirs; and that, as we must attribute to the feminine pronoun *-e* a prototype *\*T*, *\*T'*, so we may attribute to the feminine in *-e*, *-i* of the Coptic nouns an Egyptian prototype in *\*T*, *\*T'*: *σove* = *SON<sup>t</sup>*; *βωκε* = *B<sup>t</sup>K<sup>t</sup>*.

CHAPTER VIII.—*The Verb*.—"The Egyptian verb, in its conjugation, offers an active voice and a passive voice; the indicative, subjunctive, optative, imperative, participle, and infinitive moods."† As we have just said, the Egyptian has no moods: the relations of the subjunctive, imperative, potential, infinitive, which we express by a special modification of the root, are indicated either by syntactical locutions, or by the adjunction to the verb of independent particles. So it is that M. Brugsch, after having affirmed that there are moods in Egyptian, is constrained by the facts to contradict his declaration. "The Egyptian speech and writing have no special forms to express the subjunctive mood, which latter is announced by particles placed before the various forms of the tenses."‡ Speaking of the imperative, "The naked root of the verb without the addition of any sign whatever is employed oftenest to mark the presence of the categoric imperative." The remaining forms of the imperative are composed by an addition of other precativ or supplicative verbs, *MÂ*, *give*; *AR*, *do*; or the exclamation *A*, *oh!*§ The infinitive is "represented by the verbal root, without addition of any particular sign."|| Thus the modality possesses no special and definite marks: it is expressed by various syntactical devices which have nothing common with the processes of what we call conjugation. It is the same as saying that there are no moods in Egyptian.

There is something really alarming in M. Brugsch's notion of thirty-two tenses for the Egyptian indicative. If he had divided the forms of the verb according to the principles I have mentioned above, he would have obtained only three types of conjugation: (1) by suffixing to the verbal root the subject, whatever it be, either noun or pronoun, or member of a phrase; (2) by preposing to it one or more auxiliaries; (3) by placing between the auxiliary and the verb a preposition which marks the direction of the action done or undergone by the subject. Most of the forms given by M. Brugsch, and many others in *M<sup>r</sup>K*, *H'Â*, *χ<sup>p</sup>R*, he has not given, would have been more naturally distributed in those three categories; perhaps he would have been induced by this division to take away several forms, the eleventh for instance, *ARÏ PÛ ARÏ-N-EW*, which are not, properly speaking, verbal forms, but syntactical combinations, or the third, *AR-N-EW*, which is a mere phonetic variation of the second, *AR-AN-EW*.

According to M. Brugsch, the Coptic futures in *ε* and *ve* are derived from the verbs *εÏ*, *to go*, and *AN*, *to bear, to come*; so that *εÏμε*, *εÏμε*, should be translated *I go, I come to love*, like the French *je vais aimer*. I would not insist upon this etymology but that it might, if allowed to pass, become a cause of great errors. The Coptic futures are not formed with the help of these two verbs: they are derived from

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 58.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The Editor cannot reply to questions from authors respecting the notice of their books.*

*The next number will be published on Friday, November 1, and Advertisements should be sent in by October 28.*

## General Literature.

## BUDDHIST FOLKLORE.

Ten *Jātakas*; the original Pali Text, with a Translation and Notes. By V. Fausbøll. Copenhagen: Hagerup. London: Trübner and Co.

IN this little volume M. Fausbøll has given us a new instalment of the Buddhist *Jātaka*, consisting of ten consecutive stories taken from the second great division called the *Duka Nipāta*, and forming a valuable addition to our stock of knowledge of this remarkable collection of ancient tales. The first of the ten *Jātakas* is entitled, "A Royal Admonition," and the story is briefly as follows. There was once a king of Benares named Brahmādatta, whose righteous administration of justice put an end to litigation in his kingdom, and left him time to turn his attention to his own faults, with a view to their correction. He accordingly questioned first his own retinue, then the public officials, then the citizens of Benares, then the suburban inhabitants, and lastly, mounting his chariot, he drove through the length and breadth of the land, begging all whom he met to tell him his faults. But all with one accord told him only of his virtues, and he was returning, baffled, from his expedition, when in a narrow defile his chariot met that of Mallika, king of Kosala, who was bound on a precisely similar mission. It at once became evident that one of the chariots must make way for the other, and the charioteers of the rival monarchs commenced a dispute for the precedence, which seemed hopeless when it was ascertained that neither could claim any advantage over the other in age, wealth, fame, or military power. At length, however, it was decided that the more virtuous should have the precedence, and the charioteer of king Mallika, challenged to describe the virtues of his royal master, replies as follows, "King Mallika overthrows the strong by strength, the mild by mildness, good he overcomes with good, and evil with evil." The other charioteer retorts, "If these are his virtues, what are his faults?" and thus sums up his own master's practice, "With meekness he conquers anger, he overcomes evil with good, he disarms avarice with liberality, and the liar with truth." These noble words have drawn from M. Fausbøll a well-merited panegyric; he points out that the teaching they convey is absolutely identical with that of Jesus, and he adds, "The more I learn to know Buddha the more I admire him, and the sooner all mankind shall have been made acquainted with his doctrines the better it will be, for he is certainly one of the heroes of humanity"—a sentiment which most of those who have given Buddhism more than a passing

VOL. III.—NO. 58.

study will heartily echo. The story ends by saying that Mallika and his charioteer instantly alight and draw aside their chariot, and the good king Brahmādatta, who is Çākya-muni in an anterior existence, returns to his capital, after giving Mallika some wise admonition. In the second *Jātaka*, the Bodhisattva is a lion who has six brothers and one sister. A jackal, the meanest of the animals, dares to lift his eyes to the young lioness and offer her marriage. Indignant at this affront put upon their family, the younger lions one after another rush hastily upon the jackal, who is snugly ensconced in the "Crystal Cave," and dash themselves to pieces upon the transparent adamant. But the Bodhisattva, warned by the fate of his brethren, noiselessly approaching the cave, sends forth a roar so terrific that the jackal's heart bursts with terror, and he dies a craven's death. The moral is, "Look before you leap," or, as the text says, "The hasty man is ruined by his own actions." The third is an amusing tale of a hog who fancies he has inspired a lion with fear, and challenges him to mortal combat. The lion fixes that day week for the duel, and the hog, scampering back to his herd, proudly declares that he is going to fight the lion. The announcement is received with terror, and the crestfallen hog takes the advice of his friends to roll in a dunghill before encountering his dreadful foe. Accordingly on the fateful day our hero presents himself before the lion armed in a panoply of filth, and the noble beast, scorning to touch so contemptible a foe, says, "If you want to fight, I leave you the victory." The story adds, with a dry humour, that the hog told his friends he had "conquered the lion!" I pass on to the fable of the lion and the jackal, which is the seventh of this series, and breathes the true spirit of Buddhism. A jackal having by his cunning extricated a lion from a position which threatened him with death, the two animals from that day became sworn friends. But after a time the lioness, jealous of the jackal's mate, did all she could to terrify her and her cubs, with a view to procuring the dismissal of the obnoxious family. The jackal went to the lion and humbly sued for permission to break off an intimacy which had become dangerous to him. But the lion, after enquiring into the circumstances of the dispute, nobly stood by his friend, and, rebuking his lioness with the words, "A steadfast friend, even if he be weak, is a relative and kinsman," for the first time told her the origin of his intimacy with a creature so low as a jackal. The story ends by saying that the two families lived happily together for seven generations. The *Suhamu Jātaka* relates how two exceedingly vicious horses, being let loose upon each other, exhibited, to the amazement of all beholders, every sign of satisfaction, and began licking each other affectionately. The moral is, "Birds of a feather flock together," or, as the tale expresses it, "the vicious Suhamu makes friends with every plunging, rearing, biting horse; the wicked with the wicked, the sinner with the sinner." The ninth story is entitled, "The Peacock," and is of very high interest. Once upon a time the Bodhisattva was born as a golden peacock, "beautiful and graceful, and variegated between his wings with bands of exquisite colour." Taking his stand on a Himalayan mountain-top, the radiant bird salutes the rising sun with this "sublime hymn," which he has composed to ward off evil during the day:—

"Rises the all-seeing universal king, who shines upon the earth with golden ray;  
Thee I revere, lord of the golden sheen; 'neath thy protection may we live this day."

"The saints whose knowledge doth all things transcend, theirs be my homage, may they me sustain;  
Praise to the Buddhas, praise to their truth sublime, praise to the holy freed from error's chain."

Again at sunset, gazing from his lofty post upon the vanishing orb, he breaks out into the song :—

"He sinks, the all-seeing universal king, the golden-hued who fills the earth with light :  
Thee I revere, lord of the golden sheen ; 'neath thy protection may we rest this night."

"The saints whose knowledge doth all things transcend, theirs be my homage, may they me sustain ;  
Praise to the Buddhas, praise to their truth sublime, praise to the holy freed from error's chain."

M. Fausböll has entirely altered the character of the second stanza of these invocations by taking *brāhmaṇa*\* in its ordinary sense of "a brahmin," and by rendering *buddhā* "the wise," and *bodhi* "wisdom." He justifies this course in the following words : "There are no grounds for interpreting the single words of this tale Buddhistically, nearly all the tales of the Jātaka-book are old folklore in common for all India without regard to religion, and many of them treat evidently of pre-Buddhistic brahmanical affairs, and have been made Buddhistic in their application only." But this does not really meet the question, which is whether a non-Buddhist would make use of such expressions as *nam' atthu buddhānam*, *nam' atthu bodhiyā*. I think not ; at any rate the subject is not one that can be summarily dismissed in a few lines : it is scarcely necessary to observe that the comment on the lines takes them in a strictly Buddhist sense. The story continues as follows. One night Khemā, the wife of Brahmadatta king of Benares, dreamt that she saw a golden peacock, and she entreated the king next morning to get the bird for her. A fowler was sent to snare the Bodhisattva, but owing to the efficacy of the charm repeated night and morning all his efforts were in vain, and at length the queen died without obtaining her wish. The king, bitterly complaining that the peacock had caused his wife's death, wrote on a gold plate the following inscription : "A golden peacock dwells in the Himalaya, whose flesh confers perpetual youth and immortality." The first five successors of Brahmadatta in turn read this inscription, and, eager to obtain eternal youth, sent fowlers to capture the wonderful bird, but in vain, the magic spell rendered all their snares unavailing. But at length the wiles of the fowler commissioned by the sixth king were successful, the peacock forgot to repeat his spell, and fell into the hands of the sportsman, who carried him in triumph to the king of Benares. The delighted monarch was rejoicing in the prospect of immortality when he received from the peacock a revelation which induced him to spare his captive's life. "I was once," says the Bodhisattva, "a universal monarch (cakravartin) in this city, and made all men obey the precepts of Buddhism. As the reward of my conduct I was re-born at my death in the Tāvātimsa heaven. But when I left that abode, owing to some misdeeds in a previous existence, I was re-born as a peacock,† but became golden-coloured as a reward for my piety while a universal monarch." The king rejoins, "You say your colour is owing to your having once been a pious cakravartin in this city, but how am I to believe this? have you a witness?" "I have," replies the Bodhisattva, "When I was king I travelled through the air in a jewelled chariot, and this chariot was buried in the royal pleasure tank, where you will find it." The king drains his pleasure tank, finds the chariot, becomes a convert to the Buddhist faith, and bestows royal honours on the peacock, who, after a brief sojourn, returns to his mountain home, with the parting injunction, "Make haste, great king, to work out your salvation." Such is the beautiful *Mora Jātaka*, a tale which

appears to me thoroughly Buddhist from beginning to end.\* M. Fausböll would be the first to admit that all except the peacock's invocation is Buddhistic, and his taking the invocation in a brahmanic sense involves the bold theory that the verses of some, at least, of the Jātaka tales can be dissociated from the story which contains them. M. Fausböll has nowhere stated such a theory, and it is scarcely within the bounds of possibility that it should be a true one. In his preface M. Fausböll has justly observed that the "framework" or preamble of each tale is no doubt less ancient than the tale itself, but this in no way bears on the connection between the tale and the verses which it contains. The moral of the tenth story is, "Pride goes before a fall." Once upon a time a golden swan, who lived in the deva world and had two sons as beautiful as himself, formed a connection with a crow who lived in the kingdom of Videha, near the capital Mithilā, and their offspring was a mongrel bird, to whom they gave the name of Dapple. The young swans, having ascertained the cause of their father's frequent visits to the world of men, begged him to let them bring their low-born brother to their own celestial world. They received permission to do so, and, perching Dapple upon a stick, seized each an end, and soared into the air above the city of Mithilā. It so happened that king Videha was at that moment driving round the city in his state chariot, drawn by four snow-white Scinde horses, and the base-born Dapple no sooner caught sight of the royal equipage than he exclaimed, "Why, I am every bit as grand as king Videha ; he has a chariot with white horses, and I have a chariot with golden swans." Indignant at his presumption, the swans were at first about to let him fall to the ground, but relented and carried him to their father. The latter, hearing the story, sent his unworthy offspring back to earth with these scornful words, "You tread on dangerous ground, my son, this place is too good for you ; go back to your village and your mother's home." And the crestfallen bird ended his days on his native dunghill.

In an appendix M. Fausböll has given the Pali text, without a translation, of two tales taken from a different part of the Jātaka-book. One of these has the same title as the first of the Ten Jātakas. It relates how a king Brahmadatta, wandering about in search of some one who will tell him of his faults, comes into a part of the Himavanta fairyland, in which everything he eats, even a banyan leaf, has a delicious taste. He is informed by a pious hermit (the Bodhisattva), who dwells there, that in this district everything tastes sweet to those who live virtuously, and bitter to those who live wickedly. To test the truth of this assertion, Brahmadatta goes back and rules unrighteously for a short while, after which he returns to Himavanta and finds the food bitter, as predicted. The hermit then recites some stanzas to the effect that as cattle in crossing a river follow their leader whether he goes straight or crookedly, so if a king goes wrong his people go wrong also, while if he rules well the people are happy. The king profits by the Bodhisattva's admonition, and returning to his kingdom reigns righteously ever afterwards. The remaining tale is called *Mahāmora Jātaka*, and up to a certain point follows the *Mora Jātaka* pretty closely, but ends differently, the peacock, when captured, converting the fowler, who sets him free. It is worthy of note that this tale presupposes a knowledge of the *Mora Jātaka*, of which, up to the capture of the peacock, it is little more than an amplification.

In editing these tales M. Fausböll has fully maintained the high standard of his *Five Jātakas* and his *Dasaratha*

\* I have elsewhere shown that *brāhmaṇa* in Pali is constantly used in the sense of an Arhat or Buddhist saint.

† The animal existence is one of the four states of punishment.

\* The peacock's invocation forms part of the *Pirit Pota* (or "Book of Spells against Evil Spirits"), translated by Gogerly.

*Jātaka*. The text is collated, and the variants are recorded, with a laborious care deserving of the highest praise, and the translation is scrupulously accurate throughout, indeed too accurate for elegance, the occasional use of the historical present, for instance, being a decided blot on an English version. I have noticed one or two slips, as at p. 80, where *pakkhānam antare* is inadvertently rendered, "among the birds," and at p. 47, where *te me namo* is rendered, "those I worship": it should be either, "they are (the objects of) my homage," or, as the comment takes it, "may they receive my homage." I may observe that *namo* in Pali seldom or never means "worship" in our sense.

The twenty pages of notes contain much interesting matter, but might, I think, have been shortened with advantage.\*

The appearance in rapid succession of the *Dasaratha Jātaka* and the *Ten Jātakas* is a pledge that M. Fausböll has returned to his labours in the field of Pali literature with all his old zest and energy; and we may hope that he will henceforth devote himself exclusively to the Buddhist folklore, a department which he has made so entirely his own. In concluding this notice of his latest work, I would venture to suggest that, instead of giving us from time to time detached fragments of the *Jātaka*-book, he should begin at the beginning and go regularly through it, issuing at stated intervals a volume containing either a certain number of tales or a certain number of pages. We should thus gradually get a clear idea of the book as a whole; and if the *Jātaka Niddāna* was made the first volume of the series, we should know what the Buddhists themselves have to say concerning the origin of the tales. By omitting notes and appendices (which do not interest the general student of folklore), M. Fausböll would greatly expedite his labours; and at the rate of thirty or forty *Jātakas* a year, he might well hope to accomplish in his lifetime the task of editing the entire *Jātaka*, a task worthy of one who divides with the illustrious Burroughs the fame of having created Pali scholarship.

R. C. CHILDERS.

### LITERARY NOTES.

In *Im Neuen Reich* (September 27) Dr. A. Dove, one of the *collaborateurs* in the *Life of Humboldt* recently published, sums up the results arrived at by his biographers. He took a serious interest in a variety of special studies, but before he had attained to real eminence in any one, he always left it for a fresh pursuit. His *Kosmos*, though a marvellous compilation, was only begun after his independent contributions to science had ceased. His reputation therefore was highest when he was doing least to deserve it, but if he is regarded as a representative of the scientific culture of his age, it will scarcely appear exaggerated.—In the same periodical, an article, "Blicke über Klostermauern," is chiefly remarkable as a picture of the comfortable worldliness of monastic life in the well-to-do orders in Germany.

We understand that a work on Dante, by Mr. J. A. Symonds, will shortly appear. It is intended to serve as an introduction to the study of Dante's poems as well as of his life.

The last of ten articles on "France and the French," by Karl Hillebrand (*Allgemeine Zeitung*, October 6), discusses the curious technical facility and *savoir-faire* which makes French mediocrity in literature and art more tolerable than the mediocrity of any other people. The writer traces it in part to the traditions of a high social cultivation, and touches on the opposite weak point of German literature by observing that Lessing, Göthe, and Schopenhauer are nearly the only German writers who were neither tutors nor professors.

A writer in the *Allgemeine Zeitung* (September 30) is reminded by the annexation of Alsace (including Saverne and the site of the furnace in which the godly knave Fridolin was *not* burnt) of some singular Welsh parallels to Schiller's *Der Gang nach dem Eisenhammer*. The lines—

"Dem lieben Gotte weich nicht aus,  
Findst du ihn auf dem Weg!"

are all that remains in the ballad pointing to a phase of the legend in which the faithful servant owes his escape to the observance of three rather oracular precepts. This is fully developed in a Welsh version of uncertain age, but ancient origin, which illustrates the proverb, "Envy consumes itself." The writer quotes from the same collection the story of a "Half-man," explained in the same allegorical manner as "the force of habit," which becomes irresistible if not wrestled with at once. Of course the primitive popular tale is always older than moral interpretations of this kind, but the latter are commoner than is generally known, and their comparative antiquity is a curious problem in folklore.

"Norwegian poetry since 1814" is so little known in England that Mr. Gosse's short account (in *Fraser*) of the chief modern Norwegian poets will be read with interest, though it is difficult, without more numerous translations, to give a really distinct representation of the quality and strength of their several claims to poetical eminence.

### Art.

*The Dream of Poliphilus*. [*Ueber den kunsthistorischen Werth der Hypnerotomachia Poliphili*: ein Beitrag zur Geschichte der Kunst-literatur in der Renaissance. Von Albert Ilg.] Wien: Braumüller.

THERE is no book, I think it may be said advisedly, in which a whole phase of human culture is reflected so fully and vividly, and from so many sides, as in the romantic vision of the Dominican father Francesco Colonna. And yet the name of Francesco Colonna is a name next to unknown, and his book of *Poliphilus* a book unknown beyond a narrow circle of collectors and the curious, who prize it only for its engraved embellishments, a small portion of its vast real significance. The present author does indeed (as we shall see by and by) underrate the amount of attention which has been paid to his subject by previous writers. But he rates very justly, and as no one else before him had done, the amount of attention which is its due. In fastening on the book of the *Hypnerotomachia* as the most concentrated, most comprehensive and many-sided expression of the early Italian Renaissance in its myriad enthusiastic modes at once, Dr. Ilg has shown a true sympathy with the spirit of the time; and he has sketched out what might grow into a contribution of the first value towards its spiritual history. Dr. Ilg is editor of several parts, published and projected, of the admirable Vienna series of *Quellenschriften für Kunstgeschichte und Kunsttechnik*. The piece before us was written as an essay for the degree of Doctor of Philosophy at Tübingen. Hence, upon some strictures presently to be made, it should be borne in mind that we are dealing with what professes to be no more than a sketch, and may accordingly be permitted in the shortcomings of a sketch, towards a subject of which the issues are without number.

In the year 1499 there came from the press of the elder Aldus at Venice a book in the vulgar tongue, bearing the following title in Latin: *Hypnerotomachia Poliphili, ubi humana omnia non nisi somnium esse docet atque obiter plurima scitu sane quam digna commemorat*. This title is arranged in an inverted cone, and followed by seven stars and a warning against piracy by any other printer within the Venetian dominions—one of the earliest declarations of copyright known. On the last page of the volume (234 pages folio) are the errata, and the printer's imprint, as follows:

\* For some philological criticisms, see *infra*, "Philology," p. 399.

*Venetis, mense decembris M.D. in aedibus Aldi Manutii.* The author's name is not expressly given. That the book had been composed by him thirty-two years before its publication, and at another place, is indicated by this subscription on the last page but one: *Tarvisiis cum decorissimis Poliae amore lorulis distineretur misellus Poliphilus, M.CCLXVII Calendis Maii.* Poliphilus means lover of Polia; the author means to tell us that he finished writing his book on the 1st of May in the year 1467, at Treviso, when he was enchained by the love of Polia in sweet and honourable bonds. And the tenor of his story is how once upon a time he thought himself enamoured of Polia in a morning dream, and how his dream led him, through strange adventures and ravishing sights and lessons in her company, to the very point of fruition, when sunrise broke upon his sleep, and the vision vanished away. The example of Dante has been in his mind. He represents himself as wandering in a wood in his dream, as drinking the waters of a brook, as terrified anon by a ravening monster, before whom he flees, presently to find himself within a world all enchantment and magnificence, with nymphs, as free and friendly as they are beautiful, to do him its honours. There he meets the lady of his love, at first without knowing her, and is by her accompanied, encouraged, and instructed in the meanings of all that he sees and admires. The love story is constantly subordinated or forgotten; the progress of events is clogged by an extraordinary profusion of descriptive details, that unite in a curious degree the most minute and fatiguing technical pedantry with the most enthusiastic and enjoying affection and poetical rapture. It is a more than childish facility of imagination, a more than Asiatic exuberance of gorgeous or mystic material imagery. And such a style!—a Lombard Italian larded with unheard-of forms which the writer has incorporated or invented from the Latin, Greek, and Hebrew. “*La mia abrodieta Polia*,” “*zacharissimamente*,” “*strophiosamente*,” “*enucleatamente*,” “*profuse lachrymule*,” “*mustulenti morsiunculi*,” “*limatissimo eloquio*,” these are the kind of flowery vocables with which his pages teem. According to a childish fashion of the Renaissance in more than one of the Romance literatures, every other epithet has either the superlative or the diminutive Latin form, and every other substantive the Latin diminutive, for expressing adequately the marvellous and delightful nature of the things which they describe. The effect of this language is grotesque, pedantic, and puerile in the last degree; it is an Italian both barbarised and effeminated, and could not be read but for the extraordinary warmth and richness of the imagination by which the scenes described in it have been bodied forth. It is the style stigmatised in Italian literature as *Fidentian* (according to the burlesque of Camillo Scrofa, published not many years later under the name Fidentio Glottochrysio). You get accustomed to it as you read, and find that you are in the company of one who possesses, and pours forth without stinting, all the jumbled and excited new knowledge of an age that has just struck the lost fountains of antiquity. It is the early Renaissance—drunk with antiquity: lifted up with the delights of marble and manuscript; a world rejoicing with the sense of new blood in its veins, new freedom for its thoughts, the lust of the eye and the pride of life made lawful and honourable again. You soon discover that you are reading an allegory, and that under the figure of Polia you are to understand the classic age, the antiquity of Greece and Rome; under the figure of the five nymphs, the five senses that conduct the lover of that antiquity with delight towards what he seeks. Poliphilus wooing Polia is the Renaissance wooing the past. And the passion of the age is by no means overstrained in that similitude. Indeed it is just the kind of similitude which

modern criticism, reflecting from a distance on the age's spirit, might have chosen to represent it under. The profound genuineness of the passion carries you, with a certain cordial amusement and sympathy, over even the most profuse and tedious pauses of its progress, the most lingering amplifications of antiquarian and artistic pedantry. The writer is a marvel of scholarship; he has Vitruvius and Pliny at his fingers' ends; half his book is taken up with technical descriptions of architecture, palaces, temples, mausoleums, baths, fountains, gardens, which he imagines and lays out with infinite detail according to the divine precepts of the ancients as he has understood them. He devises monuments, tombs, and urns, with funerary inscriptions in a sentimentalised Ciceronian, good enough to pass with some later scholars for original. He has an idea of his own as to what the hieroglyphs must have been, and describes a quantity of relief carvings, having the nature of a modern rebus, which he conceives to correspond to that word. He is full of connoisseurship about ancient gems and intaglios. He is steeped in classical fable and history, and cannot breathe a sigh to his mistress without sending after it a dozen learned reminiscences of ancient heroes in predicaments parallel to his own. He invents pageants and triumphs without end, and describes them with rapture—pageants, triumphs in the spirit of Mantegna, Priapic festivals, and sacrifices to Venus. And beside his knowledge and passion for art and the antique, he has a parallel passion for nature and what one ought to call science: he makes the most immense and affectionate exhibition of botany and herbal knowledge according to the lights of his day.

And all this, which makes of the text of his book so romantic and fantastic an encyclopaedia of his age, its eager acquisitions and aspirations, is illustrated with one hundred and seventy-two woodcuts—the prize of the collector and the curious—which are as interesting for the history of the art as they are beautiful in themselves. They are pure, almost bald, outline designs, some in illustration of the architectural and antiquarian imaginations of the book, some of its figure incidents, the adventures, pageants, spectacles, and love passages. And these latter are without their like in the history of woodcutting. They breathe the spirit of that delightful moment when the utmost of imaginative *naïveté* is combined with all that is needed of artistic accomplishment; and in their simplicity are, in the best instances, of a noble composition, a masculine firmness, a delicate vigour and grave tenderness in the midst of luxurious or even licentious fancy, which cannot be too much admired. They have that union of force and energy with a sober sweetness, beneath a last vestige of the primitive, which in the northern schools of Italy betokens the concurrent influence of the school of Mantegna and the school of Bellini.

Who is the learned linguist, architect, botanist, antiquarian, poet, the anonymous author of this wonderful and wonderfully embellished composition? The anonymousness is thin after all; for, in his riddling way, the author has revealed himself by the initial letters of his thirty-eight chapters. Put these together, and they read: *Poliam Frater Franciscus Columna peramavit*. Brother Francesco Colonna accordingly is the name of one who by this work comes down to us as one of the most variously gifted, one of the most poetical and encyclopaedic, of all the illustrious group of the early humanists in Italy. And yet his personage is by far the most obscure among them all. All that the learned Prosper Marchand, writing in the first half of the last century, could learn about him from the chroniclers of the Dominican order, was that he was a brother of that order, born at Venice, resident part of his life at Treviso, the author of a famous work of literature in the mother tongue,

and by and by buried at Venice in the Church of SS. Giovanni e Paolo. The later researches of Federici, as quoted by Marchese, prove him to have been born in 1433, to have already belonged to the Predicants so soon as 1455, to have resided at Treviso up till 1472 (and there, as we have seen, to have composed the *Hypnerotomachia* by his thirty-fourth year): to have professed rhetoric and languages at Treviso, and theology, subsequently to 1473, at Padua; to have been at Venice on a mission from his order in Padua in 1483; again, after a long gap, to have been in receipt of relief in food and fuel, on account of age and infirmity, from the convent of SS. Giovanni e Paolo; and finally to have died at that convent in the ninety-fourth year of his age, October 2nd, 1527. It has been inferred, rather than proved, that he must in his youth have been a great traveller in order to acquire the precocious mass of knowledge which places him in the front rank of the investigating students of his time, and which would have done honour to a Poggio or a Cyriaco. There is evidence of friendship between him and Ermolao Barbaro.

Another doubtful point is whether he really celebrates any earthly love under the allegoric figure of Polia. The early commentators unhesitatingly assumed that his heroine was a lady of Treviso, and called her, according to indications which they found in the text of the book, a Lelia Mauro, or a Lucrezia or Ippolita de' Poli. Later ones, and principally Father Marchese, whom Dr. Ilg follows, believe that there was no such lady, and that Polia is a personification only—as it were the Greek *παλιά*, the adorable and venerated antiquity. I think the opinion of Lamonnaye the more probable, according to which an abstract passion for antiquity and a concrete passion for a mortal lady would both be typified and blended together in the heroine. We have seen how Colonna has his eye upon Dante; and as Beatrice was for Dante a mortal lady sublimated into the Heavenly Wisdom and identified with it, so would Polia be for Colonna a mortal lady sublimated into and identified with the Antique Learning, the new wisdom and new spiritual passion of his time. The human nature of Italy and its fashion alike would make the fact of an earthly passion antecedently probable, even in a brother of the order of Dominic. If there were no such real passion in question, I cannot see any meaning in Polia's long description of herself at the beginning of the second book, pointing explicitly to a Christian name *Lucretia*, and to a family of Trevisan fame supposed to be descended from the Laelia gens; neither, if such a lady had not lived and died, could I see any sense in the epitaph to her which closes the second edition of the book.

The history of the *Hypnerotomachia* and its editions and fortunes is curious. The first edition had been put into the hands of the printer Aldus, not, as we see, by the author himself, but in his lifetime by Leonardo Crasso (a forgotten jurist of Verona) long after it had been composed; and it contains a preface to that effect. The second Italian edition was published, with corrections of errata and one or two other slight changes, by the younger Aldi in 1545. The next year a French translation appeared, printed by Kerven in Paris for Jan Martin, secretary of the Cardinal de Lenoncourt, who wrote a preface to it explaining how the translation, or free imitation rather, had been put into his hands by a friend. Here the affectations of the Italian style are pointed out and corrected; and the result is a fine specimen of sixteenth-century French prose. In 1554 another issue of this was called for; another in 1561, to which one Jacques Gohori wrote a preface, stating that the original French translator had been a knight of Malta, and he, Gohori, the friend who had put it into the hands of Martin. At the same time

Gohori gave a hint of its containing mysteries of price for the alchemist. This opinion grew, together with the superstitious respect founded upon it; the book, besides its enormous popularity as a romance and encyclopaedia of classic learning, got in France the fame of a treasure-house of hermetic science besides. Its next French editor (1600) was Beroald de Verville, a deep alchemist and Paracelsian, who made some trifling alterations in the text and the wording of the acrostich, and hinted ineffable things about the philosopher's stone being there for such as knew how to find it. Many students now take its fabricated inscriptions for genuine; but Isaac Casaubon, and one or two such heads, smile and say *they* are not to be taken in by "suaviludius ille" on this point. These French editions (I have not seen that of Beroald, and speak of the earlier) were adorned with engravings cut on wood by a native artist in imitation of the Italian. These, too, are excellent in their manner, so excellent as to have been attributed by modern criticism, without quite sufficient reason so far as I am aware, to either Jehan Cousin or Jehan Goujon, the great painter and great sculptor of the latter Valois reigns. Nothing is more interesting than to compare the designs one by one; the French artist takes the motive of the original faithfully enough, but transforms it according to his own spirit, puts in more motion and agitation, less grave grace and simplicity, a freer cast of draperies, a less disciplined drawing, a more elaborate and less simple—but in its way very admirable and powerful—mode of treating landscapes and flowers. About the same time an English version was published by S. Waterson. Then the popularity of the work dies out, and the notices of it get vague and muddled. It has got about that the designs are by Raphael forsooth. That mistake serves the value of the book, and is used in sale and library catalogues; it has been repeated into later times by Papillon. The author's name is even partly forgotten, in spite of the transparent nature of the acrostich in which it is conveyed. From Rabelais to Bayle, casual notices of *The Poliphilus* occur in French writers; but after Balzac and sound taste its contents have come to be solemnly denounced as "in the highest degree irregular," or more briefly to be dubbed *galimatias*; and there is a passage in which the great Despréaux is supposed to ridicule the style. Ménage has an allusion to the volume, and Lamonnaye, in his addenda to the Amsterdam edition of the *Ménagiana* (1726), collects a quantity of information relative to it, and starts the theory which I have quoted, of Polia being at the same time a real lady of flesh and blood, and an abstract ideal of the antiquarian mind. The Italian engineer and architectural writer Temanza, and the French Félibien, both discuss at length, in the early part of the eighteenth century, the attainments of the author in Vitruvius and in architecture generally. The posthumous *Dictionary* of Prosper Marchand (1758) contains a formidable mass of citations and authorities in connection with the work. In subsequent histories of literature, Colonna is slightly mentioned by Tiraboschi and Guinguéné. And finally, many readers are probably acquainted with the pleasant little romance (*Francesco Colonna*) into which Charles Nodier turned the somewhat slender knowledge and ample fancy which he possessed on the subject; as well as with M. Michelet's forcible allusions to *The Poliphilus* (in his twelfth volume) as the favourite and typical literary food of that France of the Renaissance into which the versions of it were published.

There are obviously a vast number of aspects in which this singular book has to be regarded by a writer undertaking to examine it as Dr. Ilg has done. First and most important, there is its general relation to the culture and ideas of its time. For that Dr. Ilg is admirable. His opening section on the peculiar character assumed by the Renaissance

in Venice, the different form which the humanistic impulse took there and, for example, in Florence, are full of instruction. Again, his ample general knowledge of technical art literature and its sources in the Renaissance age give the utmost weight to what he says of the importance of the *Hyperotomachia* from this point of view—if its artistic could be segregated from its romance portions—and of its relative place beside the treatises of Alberti, Serlio, Lionardo, Piero della Francesca, and the other great humanists, classicists, geometricians, encyclopaedic students of antiquity and of nature, pioneers of the modern humanity. In the course of this section Dr. Ilg has frequent sentences, which we regret that space makes it impossible to quote, touching his subject with a tact of appreciation which, over and above the remarkable force and grace of his style, mark him out for a writer of whom we may expect the utmost in the fields which he has chosen.

Then there is the side of the romantic contents and narrative movement of the *Hyperotomachia*, and these Dr. Ilg has set forth with great industry and spirit. He has travelled conscientiously through the book, and gives us a *précis* of each chapter, with a discriminating enlargement on all the more significant and characteristic episodes.

There is the side of its literary and linguistic interest, and on this Dr. Ilg is silent. He does not follow Tiraboschi and the other authorities into any discussion of the "Fidentian" or pedantesque style, which was adopted by some of the humanists who did not, like most of them, eschew the mother tongue altogether, and of which this is so memorable an example. But he has a conjecture of his own, which bears on the question of style. He points to the dedication of Poliphilus to Polia at the beginning of the book, in which Poliphilus says that he had for Polia's sake, and at her instance, abandoned *il principiato stile*, and translated (*traducto*) his work into its present form. Dr. Ilg is wrong in saying that he is the first to have noticed this point in the dedication. It was noticed by Lamonnaye, and understood by him, and by others after him, as meaning that Colonna had begun his work in the ordinary Italian vernacular, but afterwards, perhaps owing to pedantical tastes in the mortal Polia, changed it into the larded or Fidentian style. Dr. Ilg, on the other hand, remembering the rumour current among the older commentators of an original Latin version, supposes the work to have been composed, although never published, in Latin at the first date, 1467, and that then, for the sake of a more extended popularity (and thus, as it were, for the glory and at the instance of Polia herself), the author transferred or translated it into its present form for publication. That, I think, is acute, and would account for the kind of fundamental and quintessential Latinism which, in spite of Grecian and Chaldaic admixtures, is the note of the style, better than it can be accounted for by the hypothesis of unaided pedantry.

Then there is a whole fountain of interest in the comparison both of figure and ornamental subjects in the French and Italian editions—the comparison of human ideals and architectural ideals (for both artists treat the text with considerable freedom) in the Venice of the closing *quattrocento* and in the Paris of the latter Valois, half a century off. On this our author has nothing to say, being personally unacquainted, as we may gather, with the French editions.

There is also the side of bibliography and literary history: and here Dr. Ilg is rather weak. He says the number of writers who have mentioned the book is very small, and includes only Apostolo Zeno, in his *Life of the Aldi*; Leander, in his *Writers of the Preaching Orders*; Federici, in his *Memorials of Treviso*; Marchese, in his *Lives of the Dominican*

*Artists*; Cicognara, Selvatico, d'Agincourt, Zahn, Papillon, Passavant, and Nagler—generally, says he, with only a few words each. The very imperfect sketch we have ourselves run through above will show that, besides Félibien, Dr. Ilg here passes over the two capital and particular authorities, Lamonnaye and Marchand. And this leads him into a further error. He speaks of a few secondary Italian commentators in the seventeenth century as ignorant of their author's name, and then says that the truth was first found out, and the acrostich solved, by P. Pedrogalli and Apostolo Zeno. This comes of blindly following Marchese. I have not been able to refer to Apostolo Zeno's *Lives of the Aldi*, in which it seems he relates his discovery; neither do I know if the date of his solution can be earlier than Villani and Aprosio's *Discorso della Poesia Giocosa*, quoted by Marchand as explicitly giving the key to the riddle. But here is a chain of evidence to show that the key was held by some from the beginning, and in France at least can never have been lost. In the first place, the frequent half punning insistence upon the words *columna* and *colume* in the original text points to a very meagre desire in the author to keep his secret at all. In the next, Marchand quotes from the *Giornale dei Letterati d'Italia* the description of a copy of the first edition, in private possession, bearing on the title a MS. note dated 1512 and naming Francesco Colonna as the author. And I am able to add a curious unedited testimony of a similar kind. The Cambridge University Library possesses a copy of the first edition, on the title of which is written an eulogistic sonnet of unmistakable genuineness, in *versi sdruciolati*, as follows:—

"Libro degno di cedro et di memoria,  
Bello, dotto, gentil, ampio, decorulo,  
Disceso dallo Dio del sacro chorulo,  
Del Pegaseo liquor trionfo et gloria;  
In te chiudi ogni fabula ogni historia,  
Architetture da divin lavorulo,  
Hieroliphici, gefmo, argento, et orulo,  
Et dal fanciul cupido ogni vittoria.

"Francesco di virtu ferma colouula  
Ti scrisse in stil latin, greco, et hebraico,  
Lodando Muse, Apollo, et ogni gratia.  
Sin ch'è Febo et la candida Latonula  
Il cielo illustreran, serai duratico.  
Va dunq' in man d' ognun cò buona audacia  
Et li bei spirti facia  
Del soavo scritto tuo, tuo vago flosculo,  
Ch' assai più odora del fragrante mosculo."

This is signed by one of the house of Medici, as it seems—*Sixtus medices*—in the sixteenth year of his age, *anno dñi* 1518: and the writer with his mincing diminutives shows himself an apt pupil of his master. (The second line printed in italics suggests questions into which one cannot enter here; but it points probably rather to the semi-macaronic constitution of Colonna's language than to separate versions, which it is impossible to conceive, written by him in all three learned languages.) So that a countryman of the author's names him during his own lifetime in 1512, another in 1518. Then a Frenchman, Benoît de Court, names him in a Lyons book of 1533; then Jan Martin, in his preface to the translation of 1546, directly and elaborately gives his readers the acrostichal key, the system of initial letters having been carefully observed on purpose by the French paraphrast. So that it is misleading to talk of the mystery ever having been really complete or needed rediscovery.

Once more, the question of the artistic spirit and authorship of the designs is a most tempting and extensive one. Dr. Ilg is fairly satisfactory about this. He catalogues and describes the illustrations intelligently, one by one, and then makes suggestions as to their possible attribution. He rightly points to two hands (as indeed there may be more).

of unequal skill as being apparent in the work ; and finally fixes hypothetically on Bartolommeo and Benedetto Montagna. He is no doubt accurate in seeing here that blending of the solemn and tender Bellinesque and the robust and scientific Mantegnesque spirits which you find, and which is so delightful, in the secondary Lombard artists of the closing *quattrocento*, and especially in the Vicentine school—a Buonconsiglio, a Bartolommeo Montagna. But I should say it is more than doubtful if criticism in the matter will ever be able to go nearer than this. And Dr. Ilg ignores what seems to have been conclusively proved by Messrs. Crowe-Cavalcaselle : that Benedetto was not the brother of Bartolommeo Montagna, as had been supposed, but his son, whose career could not have begun at all till twenty years after the publication of the *Hypnerotomachia*. Again, our author writes of Squarcione, and the Paduan school of Squarcione, in a way that would have been more appropriate before the latest criticism had attenuated that name to little more than mythical proportions.

It will be seen, thus, that Dr. Ilg's spirited and elegant monograph has one or two shortcomings of a kind that are not quite to be permitted to it as being a sketch and no more. He has been led into one or two positive errors by want of acquaintance with French editions and French authorities, and one or two minor critical laxities besides. But these are in the least important sections of his work. Its most important sections, those that deal with the essential significance of his subject, spiritual and artistic, and with the elements amidst which it has its place, are all that can possibly be desired. And no one could better follow up than our author himself the task which he has here sketched out in relation to this fantastic, this colossal and pathetic memorial of learning happy in its blunders, of curiosity unembarrassed in its conjectures, of enthusiasm with its buoyant imagination and luxurious pictures—the memorial, and in part the parody, of an exuberant and unexhausted hour which we have learnt to envy in laughing, and to love even while we yawn. SIDNEY COLVIN.

#### ART NOTES.

Dr. Dove writes in the present number of *Im Neuen Reich* a paper in remembrance of Edward Magnus, whose death was recently announced in these pages (see *Academy*, vol. iii. p. 327). The paper in question ultimately resolves itself into a brief review of Magnus' last contribution to art literature, *Die Polychromie vom künstlerischen Standpunkte*. It is agreed by all that the unspotted freshness of a new material, be it what it may, is unpleasant to the eye. We all desire something of a patina. The patina bestowed by the hand of time on marble or bronze is seldom quite what we want, and we recur to the hope of discovering some means by which we may produce from the beginning a thoroughly satisfactory patina, softening, heightening, or enforcing those portions only which require such additional touches. Magnus recapitulates in his pamphlet the not unsuccessful attempts made by modern artists to bestow the desired surface on bronze ; as to marble, he is obliged to confess that the secret which he believes the Greeks to have possessed still remains a secret in their hands. The much debated *circumlitio* of Pliny, "*Hic est Nikias de quo dicebat Praxiteles interrogatus, quae maxime opera sua probaret in marmoribus: quibus Nikias manum admovisset; tantum circumlitioni eius tribuebat*" (35, 11, 134), was, Dr. Magnus ingeniously suggests, a carefully overlaid artificial patina, such as might be achieved by treating faults in the marble with rosin, &c., and at the same time adding a delicate and subdued tinting of details, borders on drapery, hair, and the like. In the palmy days of Greek art these modest limits were never overstepped, but as taste became corrupted, and Oriental influence made itself felt after the time of Alexander, Dr. Magnus thinks that variegated colour, what may be called

the waxwork style, which the people's art had in truth never renounced, again got the upper hand. Dr. Magnus concludes his essay with a word or two on the less complex question of colour as a means of architectural decoration. He is strongly of opinion that on the outside of a building it should never go beyond the variety afforded by the natural colours of the stones, marbles, &c. employed.

The Bishop of Augsburg is restoring the St. Ulrich's Church, which is one of the most important buildings in the town. The church derives peculiar interest from the fact that it is a very beautiful example of late Gothic, at the moment when late Gothic was developing into early Renaissance. The fittings of the interior are indeed all but pure Renaissance. The ordinary course of the modern restorer would be to remove these at once, as being out of keeping with the rest of the edifice. But the works at Augsburg seem to be conducted with the discretion which accompanies thorough knowledge. The restorers of the St. Ulrich's Church are not unmindful of the fact that the so-called industrial art of any given epoch is always in advance by some years of the style prevailing in those great main branches the study of which demands the acquisition of sound scientific knowledge. It is in the minor and more facile departments of internal fittings, furniture, and decorations that we must look for those germs of change which appear as pioneers breaking the way before the coming of a great new style. The fittings of the St. Ulrich's Church are therefore to remain in their places, and even the repainting and gilding is to be kept within modest limits. The high altar, which has been happily called a translation from the late Gothic into the Renaissance tongue, seems to have been originally somewhat over-gilt ; this defect has now disappeared through the action of time, and great care will be taken not to reproduce it. The fine ironwork which was formerly thrust into an unobserved portion of the building is to be brought into a suitable and prominent position ; and it is proposed to fill the empty windows with stained glass. St. Ulrich's, in short, will now reassume its rightful place, and take rank, after the cathedral, as the second great monument produced by Augsburg in the blossom-moment of the Renaissance.

Kaulbach's "Todtentanz," begun many years ago, is at last given to the public. In one portion figures Pio Nono, who, as the champion of Infallibility, triumphantly holds aloft the keys of St. Peter with which he has locked the doors behind him. In spite of all precautions, Death enters in the guise of a Garibaldian with the red cap on his head. In like manner throughout, the old motive is made to carry allusions to all the special questions of the day. The work is published by Hanfstängel at Munich.

Dr. Helbig writes from Rome to the *Zeitschrift für bildende Kunst* a letter which contains an account of some recent purchases made in that city by the direction of the Berlin Museum. In the first place comes a head of Marsyas in Greek marble, found about five years ago in the excavations at the baths of Caracalla undertaken under the auspices of the Papal government. Besides this, a fragment of a relief, also executed in Greek marble, has been obtained, which came to light when the pavement of the Piazza di Pescheria was taken up last February. The third object is a portrait head of a Roman patrician found near Palestrina, some two metres below a mosaic pavement. In addition to these sculptures, two fine vases, the product of the excavations carried on at Cervetri by the brothers Bocca, and last, but not least, a bowl signed Duris : the figures are in red, and those on the outside represent a school ; each branch of learning has its group of learners standing before a seated teacher ; on the other side a youth teaches the flute, but the significance of the next set of figures is doubtful ; we have again a youthful teacher, but whether he teaches writing or drawing, Dr. Helbig (who however inclines to suppose drawing) will not undertake positively to decide.

Dr. Julius Meyer, the author of *Die Geschichte der modernen französischen Malerei* and editor of the *Allgemeines Künstler-Lexikon*, has been named director of the picture galleries of the Royal Museum at Berlin. Dr. Meyer, who has hitherto resided at Munich, has not achieved a reputation for that urbanity of

manner which the public generally desiderates in official personages. It is indeed possible that Dr. Meyer has but occasionally given evidence of that just resentment which all workers feel when called upon to sacrifice their time in amusing the vacuity of those who have nothing to do. At any rate in point of knowledge and insight we may feel assured that this post, vacant since the death of Dr. Waagen, will now be worthily filled.

A course of lectures has been announced for the coming winter, which are to be given in the hall of the Austrian Museum for Art and Industry at Vienna. Amongst the names of intending lecturers we observe those of Professor Conze, "On Expression in Ancient Art;" Dr. Thausing, "On the German Art Movement of the Sixteenth Century;" Regierungsrath Falke, "On Benvenuto Cellini and the Goldsmith's Work of the Renaissance;" Custos Lippmann, "On the History of Engraving"; &c.

There have been one or two reports of late of attempts made to injure the paintings exhibited in certain German picture galleries by cutting them with a sharp instrument or otherwise disfiguring them. In one instance at least (that of Rössler's picture in the gallery at Wiesbaden) religious fanaticism seems to have instigated the mischief. We now learn that three paintings in the Berlin Museum have suffered the most serious and disgraceful injuries, *i. e.* "Bathsheba Bathing," by Cornelius von Haarlem, on canvas (Cat. No. 734); "Portrait of an Old Woman," by Gerhard Dow, on wood (Cat. No. 847)—in this instance the slash goes right across the face; finally, "Perseus and Andromeda," a well-known masterpiece of Rubens, on wood (Cat. No. 785), has been cruelly gashed, a deep cut going right across the lightest portion of the flesh painting in the figure of Andromeda. It is a surprising fact that such an act could have been dared and have escaped remark at the present time when the museum is constantly thronged with visitors.

The *Gazette des Beaux-Arts* for October contains "Eros, a Study on the Symbolism of Desire" (first article), by Louis Ménard. The writer suggests that Hermaphrodite, the symbol of the union of the two sexes in nature, was intended to represent, under a plastic form, the same function elevated by marriage to the dignity of a social law. In the most perfect and beautiful example of the type, the Hermaphrodite of the Berlin Museum, M. Ménard thinks it impossible to see anything but a personification of Hymen; the head is covered with the veil, the emblem of marriage, and the action of the hand suggests the torch.—M. René Ménard concludes his account of the South Kensington Museum: "The first impression of the visitor is that of wild confusion; thought is impossible in the midst of this mixture of all things, and the mind is wholly prevented from fixing itself on any point whatever."—M. Émile Galichon has a notice of "Les Estampes des petits Maîtres."—M. Henry Havard continues his lively notice of the gems of Dutch art exhibited at Amsterdam in 1872.—M. Eugène Muntz concludes his notice of London Exhibitions. In running the eye over the cuts of modern English jewellery which accompany the article, it is curious to observe how, with one or two exceptions, the beauties of every ornament are nullified by some little sin of omission or commission; some ends unseen, which are wanted to explain the whole; some knot untied where firm hitch is necessary; or some solid rod inserted where a slight chain only is required. The one or two exceptions come from the workshops of Howell and James; and the text explains the mystery by informing us that this firm has called to its aid no other than Mr. Leighton, whose eye for patterning spaces is marvellously quick and refined.—M. F. de Tal reviews M. Tancredé Abraham's etchings from Château Gontier and its environs.—M. Saint-Cyr de Rayssac, in a paper on the Lyons Exhibition, reclaims against the brutal idea, which emanated from England, of mixing up pictures and other works of art with the products of manufacturing industry in one heterogeneous pell-mell.—The number closes with a portion of M. Houdog's essay on "The Church of Brou and the Artists of the Renaissance in Flanders." The reproduction of an engraving of Hans-Sebald Beham, from a silver plaque in the collection of M. Adolphe Bouillat, is deserving of special attention.

### New Publications.

### Philosophy and Physical Science.

Jödl on the Life and Philosophy of David Hume. [*Leben und Philosophie David Hume's*. Dargestellt von Dr. Friedrich Jödl.]

THE plan of Dr. Jödl's prize-essay on Hume appears somewhat narrow and timid: but its execution is certainly meritorious. The criticisms which he offers of Hume's positions are slight and fragmentary: he modestly declares it to have been beyond his powers to undertake a thorough philosophical estimate of the system or a complete exhibition of its historical relations. But his exposition of Hume's doctrines is not only always clear and accurate, but often skilful and discriminating, where some little skill and discrimination were requisite to combine properly the results of several compositions, divergent in plan and published at different times. Especially careful and judicious is his account of Hume's religious opinions. With regard to these there is some difficulty in arriving at a definite conclusion. It is certain that he was not, as is often represented, an Atheist: and there seems no reason to doubt the sincerity of his affirmation (*Nat. Hist. of Relig.* § xv.) that "any one of good understanding must adopt the idea of some intelligent cause or author of the Universe," nor of the similar statements in the *Dialogues* published after his death. It is true that in this latter treatise he develops, with unsurpassed force and subtlety, the speculative difficulties involved in the adoption of Theistic conceptions: but he does not sum up in favour of atheism, or even suspense of judgment as regards the simple immediate inference from the ordered universe to an Ordering Mind. The avowed scope of his scepticism seems limited to showing that this inference of Natural Religion cannot be made sufficiently cogent and definite to afford a basis for Rational Theology: and if the negative argument has more effect than the positive, as he presents them, it is still quite in the spirit of Hume's later philosophy to give the victory nevertheless to common sense and ineradicable instinct. That atheism has been popularly attributed to him, is probably due to the affected concealment of view in his famous essays on Miracles and Providence. The frigid irony with which he excepts the "inspired penmen" from his theory of testimony, and proposes an alliance between the sceptical reason and "Faith," naturally led his readers to regard the statement "that the whole frame of Nature bespeaks an intelligent author" as merely a pinch of incense on the altar of orthodoxy. In truth Hume and his friends seem to have curiously miscalculated the respective effects of different modes of expression of his unpalatable opinions. The *Dialogues* which he suppressed during his life, and which his literary executor regarded as a most unwelcome legacy, would really offend even orthodox readers less than the essays which he thought fit to publish. In these latter the irony merely envenoms the strokes of argument: but in the *Dialogues* there is a strain of earnest sincerity which all must feel, and a reverence for truth and sense of mystery which were perhaps the best substitutes for piety and awe that a mind like Hume's could give.

In treating of Hume's system of philosophy, it is funda-

mentally important to determine the mutual relation of the two editions of it which he offered at different times to the public. Dr. Jödl considers the *Treatise on Human Nature* on the one hand, and the two *Inquiries* on the other, as substantially identical, and dovetails them together not unskillfully in his exposition. But without saying that this procedure involves any serious misrepresentation, I still think that a study of Hume should include a careful observation and explanation of the changes which Dr. Jödl overlooks: especially since the extent and nature of these changes are so different in different portions of the system. In recasting his metaphysics, Hume's aim seems to have been to suppress or throw into shade the more unpopular parts of his speculations. As these were generally just the most subtle and profound parts, the result is that the *Inquiry into the Human Understanding* is as inferior in substance to the earlier work as it is superior in style. The resolution of the Ego into a heap of perceptions is omitted: the sensationalist theory of Time, Space, and the objects of geometry, is merely hinted in a brief, sceptical suggestion of difficulties involved in current mathematical conceptions: and the critical comparison of the vulgar and philosophical views of the external world loses much in force and completeness. Hence no one really interested in Hume's metaphysics can consent to comply with his request that the later treatise "should alone be regarded as containing his philosophical sentiments and principles." The case is otherwise with the ethical *Inquiry*, which Hume justly looked on as his masterpiece. Here all the changes appear improvements. Not only are the different discussions better proportioned and compacted to produce conviction as to the general thesis that Utility is the essential object of moral approbation: but in the important chapter in which he discusses the titles to property recognised by positive law, his views in becoming less paradoxical have become sounder and truer. In both treatises he maintains that these titles are determined partly by perception of utility and partly by "habitual connection of ideas and smooth transition of the imagination": but in the earlier work he had obviously much exaggerated this latter element.

Granting, however, that the difference between the two publications was to be ignored, there seems little fault to be found with Dr. Jödl's exposition: except that he sometimes inclines to the common error of treating Hume as a dogmatic Empiricist rather than a Sceptic. Thus he assimilates his author's doctrine as to the external world too closely to Berkeley's: and gives too Kantian a colour to his account of causality, as (e.g.) in the following summary:—

"Der Gebrauch des Causalitätsverhältnisses ist zwar für unsere Erkenntniss innerhalb unseres Vorstellens und für unsern praktischen Gebrauch von unbestreitbarer Gültigkeit, soweit die Aufeinanderfolge zweier Objecte eine regelmässige ist: seine Anwendung auf das Sein an sich und ausserhalb unserer Erfahrung in seinem Vernunftgebrauche aber durchaus unsicher und unzulässig."

Now this distinction of "Sein an sich" and "Erfahrung" does not properly belong to Hume: and it is misleading to represent him as claiming "indisputable validity" for the use of the principle of causality even within the sphere of experience. He held that its application within that sphere was irresistibly prompted by Habit and imperatively imposed by Common Sense: but still not justifiable, on strictly rational grounds.

The few criticisms on which Dr. Jödl has ventured seem rather loose and superficial. Even where they are substantially well founded, they are wanting in the closeness which we may reasonably expect from a commentator: as Dr. Jödl generally fails to notice and meet the answers which Hume has made beforehand to his objections. For example, he argues (after Maine de Biran and others) that

the original "impression" from which our "idea" of cause is derived may be found in our inner experience: that "das freiwillige Hervorrufen von Erinnerungen, die Verstärkung von Gedanken, die Bewegung eines Gliedes von einem darauf gerichteten Willensakte aus," &c. afford us an "unmittelbare Wahrnehmung des Causalitätsverhältnisses." But if by "unmittelbar" it is implied that the perception is certain and infallible, Hume's refutation of this view (in § vii. of the *Inquiry into the Nature of the Understanding*) is surely complete. If however it be argued—as I should myself argue—that perfect clearness and certainty are to be found in no class of our empirical judgments, and therefore the Empiricist has no right to demand them in the apprehension of causation: then there seems no reason to deny "immediateness"—thus qualified—to our cognitions of the causal nexus in the case of familiar external phenomena.

H. SIDGWICK.

## Notes of Scientific Work.

### Geography.

**Arctic Regions.**—The sixty-seventh paper on the Geography and Exploration of the Polar Regions by Dr. Petermann, about to be published in the *Mittheilungen*, gives news of voyages made during this season, down to September. Two Norwegian steam-ship fishing expeditions, planned to penetrate the Siberian seas, have failed through the obstruction of heavy ice and damage of the vessels, and both were compelled to return early in the year; on the other hand, a scientific expedition from Norway next season is much spoken of at Tromsø.—The French expedition under Ambert and Mack has also been delayed, on account of the litigation which has arisen in Paris respecting the disposition of the legacy of Gustave Lambert, the originator of the scheme. M. Octave Pavy, it is believed, has at length started with his long-prepared expedition from San Francisco; he aims at reaching Wrangell Land, north of Siberia, in September, and to move thence northward over the ice till May 1873, about which time, it is anticipated, an open polar sea will be reached; this polynia he intends to navigate in a raft constructed mainly of india-rubber, crossing it to Smith Sound and North America, taking the North Pole by the way. Pavy's chosen companions for the enterprise are: Dr. Chesmure, an experienced traveller in Alaska; Captain Mikes, who a few years ago attempted a voyage from America to Europe in an india-rubber boat; Watkins, a Rocky Mountain hunter; and two sailors.—The latest authentic news of the American expedition under Hall comes from Tessiusak, in 73° 22' N., the furthest Danish colony of Greenland; and the report of the condition of the ice to northward, in August 1871, is favourable to the voyage. Very interesting letters despatched by Payer and Weyprecht, the leaders of the Austrian expedition, immediately before its departure from Tromsø in July, give full particulars of the outfit and plan of this scientific voyage; the supplementary expedition to this under Count Wittek left Tromsø on the 20th of June.—The Swedish government expedition in the iron steamer *Polhem* left Tromsø on the 20th of July, and on the 4th of August reached Green Island, on the west coast of Spitzbergen, on its way to the Parry Islands. Most interesting news is contained in a telegraphic message from Hammerfest, dated 24th of August: Captain Altmann, in a fishing vessel, sailed this summer along the whole east coast of Spitzbergen, as far as King Karl Land, which this voyager found to be a group of three larger and many smaller islands. The sea was quite free from ice.—Of interest in connection with this subject is an account of the finding of the relics of Barents' expedition of 1597 to Novaia Zemlia, by Captain Carlsen in 1871, prepared by M. de Jonge, and newly published under the auspices of the Dutch government at the Hague.\* The pamphlet contains the journal kept by Carlsen, and a minute description of the relics, accompanied by a photograph of these in a group, and charts comparing the Novaia Zemlia of Barents with the island as mapped from our present knowledge of it.

**Elevation of Eastern Siberia.**—An annotated list of the geographical positions and absolute height above the sea-level of several hundreds of places in Siberia, the north coast lands and Kamchatka alone excepted, prepared by Prince Krapotkin for the *Mittheilungen*, forms a most valuable contribution to exact geography. The name of the authority for each elevation is given, as well as the observatory to which it is referred, and the heights of the more important points are fully discussed in detail.

\* *Nova Zembla. De voorwerpen door de Nederlandsche overlanders na hante overwintering aldaar in 1597 achtergelaten en in 1871 door Kapitein Carlsen teruggevonden, beschreven en toegelicht door Mr. J. K. G. de Jonge; 's Gravenhage: Nijhoff.*

**Present Population of the Globe.**—*Ergänzungsheft* No. 33 of the *Mittheilungen* is devoted to an essay by Dr. Behm, the editor of the now standard *Geographisches Jahrbuch*, and Dr. Wagner, under whose care the statistical tables of the *Almanach de Gotha* are prepared, on the changes which have taken place in territory and population throughout the globe during 1869, 1870, and 1871. The untiring labours of these gentlemen in collecting accurate statistics of these subjects from all parts of the world, and the exceeding care which has been taken in comparing and selecting them, have made Gotha the head-quarters of information in this branch of science. The summation of the many special tables for each region gives the total population of the globe at present as thirteen hundred and seventy-seven millions of souls, which must be accepted as the nearest approach yet made to the true number.

### Physiology.

**Physiology of the Sphincter Vesicae.**—Dr. J. Kupressow, in an inaugural dissertation upon this subject in *Pflüger's Archiv*, states that his experiments have been conducted in a manner essentially similar to those of Heidenhain and Colberg, a tube being fastened into the ureter of rabbits, and water poured through it into the bladder till the pressure of the fluid overcame the resistance of the sphincter. He found that in the living rabbit the pressure required to produce a flow of water from the urethra varied from that of a column of water 36 centimetres in height to one of 58 centimetres. Sex did not appear to make any remarkable difference. After death the height of the column required to cause a flow was only from 8 to 16 centimetres. Division of the spinal cord opposite the fifth lumbar vertebra reduced the height of the column of fluid rather slowly to the latter amount, but division at the sixth reduced it immediately. Section between the first and fourth lumbar vertebra was without influence upon the height of the column. It appears clear then that the centre of innervation of the sphincter lies in the spinal cord opposite the fifth and sixth lumbar vertebrae. The question arises, what is to be included in the term *Sphincter vesicae*? is it to be limited to the circular fibres of the neck of the bladder, the so-called *Musculus sphincter vesicae internus* of Henle, or to the similarly running fibres which are found in the urethra, and especially in the *pars membranacea*? Kupressow's experiments have led him to the conclusion that both sets of fibres aid in effecting the closure of the bladder, though their relative importance varies with the sex of the animal; in males the circular muscular fibres of the urethra play a much more important part than in the female, for whilst in the former after slitting up the urethra the height of the expelling water column is reduced to one-half of its original amount, with females the same operation only reduces it one-fourth.

**Action of Tartar Emetic in producing Vomiting.**—There are two views regarding the nature of the action of this substance in producing vomiting. By some it is attributed to the action of this salt on a special nervous centre, whence proceed the impulses co-ordinating the muscles by which vomiting is effected. Others maintain that it results from the irritation of the peripheric extremities of the nerves of the stomach. Strong evidence in favour of this is afforded by the fact stated by Grimm, and recently substantiated by Kleimann and Simonowitsch (*Pflüger's Archiv*, p. 281), that a solution of tartar emetic acts more rapidly and energetically when introduced into the stomach than when injected into the veins. The following is one of their experiments. About two-thirds of a grain of tartarised antimony was injected into the stomach of a middle-sized dog; vomiting occurred in fifteen minutes. Two hours later half a grain more was given, and vomiting again occurred in two hours. On the following day half a grain was injected into the jugular vein, which caused no vomiting. Three days later a grain and a half was injected into the vein at 11 A.M.; vomiting occurred, but not until the evening. Analysis showed moreover that, after injection into the veins, tartarised antimony made its appearance in the first matters that were ejected from the stomach. The authors do not find any real opposition to their views in the fact that efforts at vomiting will still occur after the stomach has been excised from the body altogether, since there may still be nerve terminations in the oesophagus and intestines which occasion efforts at vomiting when irritated by tartar emetic.

**Effects of Compressed Air.**—At the Séance of the Académie des Sciences held 1st July, M. Bert communicated the results of his investigations regarding the influence of pressure upon animals. He has arrived at the conclusion that pressure is injurious, not *per se*, but because it leads to an increase or accumulation of the quantity of oxygen in the blood, consequent upon the respiration of the compressed air. He recommends therefore as likely to prove of use an artificial modification in the composition of the air supplied to divers.

### Zoology.

**The Sumatran Rhinoceros in London.**—We learn with regret that one of the two-horned rhinoceroses in the possession of the Zoological Society of London died about a fortnight ago. One was

captured at Chittagong, and the other, which is dead, in Malacca, both being thought at one time to belong to the Sumatran species described by Bell in the *Philos. Transactions* of 1793 under the name of *Rhinoceros sumatrensis*. When the two animals were compared side by side, no doubt could be entertained of their specific distinctness, and, consequently, Mr. Sclater, the secretary of the society, named the grey-coloured Chittagong specimen *Rhinoceros lasiotis* (the animal having a fringe of long hairs round the ears), retaining Bell's denomination for the black Malacca animal. Dr. Gray, after an examination of the published accounts of these animals, came to a different conclusion, viz. that the Chittagong specimen was the true *Rhinoceros sumatrensis*, and the other was most probably the animal to which the horn should be assigned, named by him, many years ago, *Rhinoceros crossii*. A third and different view is taken by Mr. Blyth, who points out that neither of the two examples can be referred with certainty to the Sumatran type; that the Chittagong animal is probably Gray's *Rhinoceros crossii*, and the Malacca animal a new species. It is not very likely that with the scanty materials in London the question will or can be satisfactorily settled at present, still it is not unimportant to have it finally solved. Abstractly from the point of view that we should ascertain as soon as possible everything respecting the big land creatures of the present period, a correct knowledge of them would prove of the greatest assistance in understanding the remains of their extinct congeners. Only a short time since the existence of a greater number of species than that generally adopted by zoologists was maintained by Dr. Gray, on apparently dubious osteological evidence, though this idea was entertained by very few zoologists, and ridiculed by others. Now it seems that of the type of two-horned Asiatic rhinoceroses, two months ago believed to be represented by a single species, three different kinds exist, and possibly four, if the Bornean rhinoceros, known by hearsay only, should prove to be distinct.

**Picus leuconotus in Great Britain.**—In the years 1861 and 1868 large flocks of a spotted woodpecker appeared in various parts of the Shetland Islands. They appear to have come from a considerable distance, and alighting in a locality ill adapted to their natural habits, they were compelled to seek their food along the shore; one specimen, on dissection, was found to have earthworms in its stomach. At first the birds were taken for the greater spotted woodpecker (*Picus major*) which had wandered from some other part of Great Britain; and in the account of this species the fact has already been recorded by Messrs. Sharpe and Dresser (*Birds of Europe*, vol. i.). Mr. Gould, however, who has obtained an example, is of the opinion that it is *Picus leuconotus*, a species whose home is Scandinavia and the North of Europe generally. If Mr. Gould's view be correct, and we have no doubt it is, these birds have immigrated, probably from Norway; and the white-backed woodpecker must now be added to the British Fauna.

**Vanessa antiopea in Great Britain.**—Nearly two hundred reports have been received from all parts of the country of the appearance of the rare and beautiful butterfly commonly known by the name of the "Camberwell Beauty." Entomologists are not agreed whether the specimens are genuine natives, or imported, or immigrants from the continent; some observers believe they have observed the recurrence of this species every seventh year. It has also been remarked that nearly all the specimens taken in Great Britain differ, to a perceptible extent, in colouring from the continental type, the border being creamy-white instead of buff-coloured. No conclusion regarding their origin, however, can be drawn from this circumstance, inasmuch as it is the general opinion of continental collectors that the buff or yellow border of the wing is the sexual characteristic of the male, while in the females this part is of a white colour. Nothing would be easier than for some person to introduce large numbers of this butterfly, as the caterpillar is gregarious, feeding on the willow; still the facts of the insect in the perfect state having been found in many districts, from the Channel Islands to Aberdeen, and that not a single instance of its having been discovered in the larval state is recorded, favour the opinion that this is a case of spontaneous immigration.

**Madeiran Spiders.**—Mr. F. Pollock has published some observations on Madeiran spiders in the *Ann. and Mag. Nat. Hist.* for the present month. Although the islands of Madeira, Porto Santo, and Deserta Grande, lie within a range of about fifty miles, each has its own peculiar spider of the genus *Lycosa*; and it is a remarkable fact that these spiders vary in size inversely with the magnitude of the island in which they are found—Madeira, the largest island, having the smallest species, and Deserta Grande, the smallest island, being inhabited by the largest (*Lycosa ingens*). The latter species is able to prey on lizards three inches long, which it devours; head, bones, claws, and all, the only remnant of the feast being a small ball, about  $\frac{1}{4}$  of an inch in diameter, which is cast aside at the bottom of the cage.

**Tortoises, Terrapins, and Turtles, drawn from Life.** By James de Carle Sowerby and Edward Lear.—This work contains sixty coloured lithographic plates, representing thirty-six species, drawn from living examples. They have been prepared under the superintendence of Mr. Th. Bell, to illustrate his *Monograph of the Testudinata*, a work the

publication of which was unfortunately interrupted many years ago. The unpublished plates were afterwards purchased by Mr. Sotheran, and Mr. Bell having declined to furnish descriptions of them, Dr. Gray consented to edit the work. In the notes of the editor the original name given by Bell to each species is retained, as well as the name used in the British Museum Catalogue, together with the references to a work in which the synonymy of the species is to be found. A few lines on the habits of the species are added from works of authors who have had the opportunity of observing them in their wild state. It would indeed have been a matter of regret if such beautiful plates, and the amount of work bestowed on them, had been lost to science.

**A Handbook of British Birds**, showing the Distribution of the Resident and Migratory Species in the British Islands, with an Index to the Records of the Rarer Visitants. By J. E. Harting.—This is an extremely useful and handy little volume. The author divides the real British birds into three groups:—1. *Residents*, or those species which rear their young annually in the British Islands, and are to be found in one part or other of the United Kingdom throughout the year; they are 130 in number. 2. *Periodical Migrants*, or those which visit us annually and regularly at particular seasons, and whose advent and departure may be foretold with precision; they are 100 in number. 3. *Annual Visitants*, that is, such as annually occur in some part of the British Islands, but in comparatively very limited numbers, and at irregular and uncertain intervals; only 30 belong to this division. In addition to this fauna are the *Rare and Accidental Visitants*, numbering 135, among which we notice 48 to be of European, 14 of Asiatic, 11 of African, and 42 of American origin, oceanic birds excluded. The author has conscientiously collected and critically examined all the instances of occurrence of birds of this class.

**On Recent Moa Remains in New Zealand**.—In the fourth volume of the *Transactions and Proceedings of the New Zealand Institute*, Dr. Hector gives an interesting description and figure of a moa's egg containing the bones of an embryo chick found at Cromwell in 1867, imbedded in sand; and he further records the recent discovery of the cervical vertebrae of a full-sized moa, with the skin partly covered by feathers still attached by the shrivelled muscles and ligaments. This interesting relic is from a cave at the foot of the Obelisk range of hills between Obelisk and Alexandra, Otago; into which it, as well as numerous other moa remains, had been washed. The colour of the barbs of the feathers, which have two equal plumes to each quill, is a chesnut red, the surface of the skin of a dirty red-brown colour roughened by numerous elevated conical papillae. The occurrence of this example, as well as that of some moa remains found by Mr. W. A. Low in 1871, in which portions of the bird's flesh "not the least fossilized, but simply well-dried, can be easily separated into fibres," affords strong evidence in favour of Dr. Hector's view that the moa must have existed at no very remote period in the province of Otago. Apropos of the comparatively recent discovery of large quantities of *Dinornis* remains, it is interesting to find that the natives most carefully preserved both the forests and the underwood as cover for the game upon which their subsistence depended. Since European settlers have occupied the islands, immense tracts have been disforested by fire and the undergrowth destroyed. The rains, formerly impeded in their eroding action by the vegetation, now cut deep ravines and wash the soil from the undulating surfaces of the country, and in this way first expose and then wash away and destroy the buried remains of the moa, which the vegetation had preserved since the extinction of this bird by the early ancestors of the present Maori race.

With the conclusion of the seventh volume, the publication of the *American Journal on Conchology* has ceased. It was issued under the auspices of the Academy of Natural Sciences of Philadelphia, in the *Journal and Proceedings* of which institution all future communications will appear.

### Botany.

**Genealogy of the Wellingtonias**.—The address by Professor Asa Gray, the retiring president of the American Association for the Advancement of Science, delivered at the meeting held in August last, at Dubuque, Iowa, was mainly occupied with an attempt to trace the history of the gigantic trees which form such a conspicuous feature of the vegetation of California. The only members of the tribe to which they belong at present existing are four in number, scattered over different quarters of the globe: the two species of Californian redwood, the *Sequoia* (*Wellingtonia gigantea*) of the Sierra, and *S. sempervirens* of the coast; the bald cypress (*Taxodium distichum*) of the Southern States, inhabiting swamps of the Atlantic coast from Maryland to Texas, and Mexico; and the *Glyptostrobus* of China. In its general features the vegetation of California is most strikingly unlike that of the Eastern United States; while, notwithstanding the attempt of Grisebach to prove the contrary, the relations between the floras of the Atlantic United States and Japan (including Northern China) are remarkably close. Fossil remains of a species of *Sequoia* almost identical with *S. sempervirens* have been found by Heer in the Miocene formation which extends over the whole of Northern Europe, and of an extremely similar

one by Hayden in the Rocky Mountains. There seems every reason to believe that at this period a nearly uniform flora overspread almost the whole of what are now the arctic and temperate regions of the northern hemispheres, of which the present floras of North-Eastern Asia and North-Eastern America are remnants. Of the three hypotheses which might be framed to account for the existence of these solitary detached representatives of the tribe—that they are the progenitors of a new form of vegetation, that they were created as we now find them, or that they are the last representatives of a race rapidly dying out—the above considerations leave us in no doubt to accept the last. The *Sequoia gigantea* now exists in numbers so limited that the separate groves may be reckoned on the fingers, and the trees of most of them have been counted, except near their southern limit, where they are said to be more abundant. A somewhat greater dryness of the climate, which must once have been much more moist than it is now, would probably bring about its speedy extinction.

**Luminosity of Fungi**.—The Rev. M. J. Berkeley records in the *Gardener's Chronicle* a very remarkable instance of luminosity in Fungi which has been observed in Northamptonshire. A quantity of wood, it is uncertain whether larch or spruce, being dragged along a road, was found to emit a bright light. The entire inner surface of the bark of the log was covered with a white byssoid mycelium of a peculiarly strong smell, and so luminous a character that it was almost possible to read the time on the face of a watch. This luminosity continued for three days. Rubbing the luminous part appeared to render the brightness more intense. The parts of the wood that were most luminous were not only deeply penetrated by the more delicate parts of the mycelium, but were also the most decomposed. Mr. W. G. Smith believes the mycelium to be that of *Polyporus annosus*, which is occasionally phosphorescent when found growing in the coal mines of Glamorgan-shire and Carmarthenshire.

**Fertilisation of the Yucca**.—At the last meeting of the American Association for the Advancement of Science, Mr. C. V. Riley read a paper on the Fertilisation of the American Yucca, showing that it is accomplished by a small moth, hitherto undescribed, which he called *Pronuba Yuccasella*, and which appears to be specially adapted for the purpose. The female only has the basal joint of the maxillary palpus wonderfully modified into a long prehensile-spined tentacle. With this tentacle she collects the pollen, thrusts it into the stigmatic tube, and having thus fertilised the flower, she consigns a few eggs to the young fruit, the seeds of which her larvae feed on. The yucca is said to be the only plant known which absolutely depends for fertilisation on a single species of insect. The plant and its fructifier are inseparable, under natural conditions, and the latter occurs throughout the native home of the flower. In the northern parts of the United States, and in Europe, where the yuccas have been introduced and are cultivated for their showy blossoms, the plant, being deprived of the good offices of this insect, produces no seed. The larva of the *Pronuba*, it should be mentioned, eats through the yucca capsule constituting its food, enters the ground, and hibernates there in an oval silken cocoon. It would no doubt be possible to introduce it in foreign countries, and thus secure the fertilisation of the yucca.

### Chemistry.

**Synthesis of Orcin**.—At the first meeting of the Association française pour l'Avancement des Sciences, held last month at Bordeaux, several important papers were laid before the chemical section over which M. Balard presided. One by M. Berthelot on the state of substances in solution is of great interest. In another (*Revue scientifique*, 12, 272), M. Henniger communicated the results of the endeavours of M. Vogt and himself to obtain orcin artificially, which they accomplished from toluene. They converted the chloride into the acid sulpho-conjugate by Wurtz's method, and by fusing this product with potash obtained orcin identical with that occurring in lichens. Orcin is a diphenol of the aromatic series,  $C_6H_3(CH_3)(OH)_2$ .

**Guadalcazarite**.—This name has been given by T. Petersen (*Jour. prakt. Chemie*, 6, 80) to a new mineral occurring with cinnabar, at Guadalcazar, in Mexico. It is compact, sub-crystalline, of an iron-black colour with a bluish streak, very brittle, and so soft that it may easily be crumbled between the fingers. It has a specific gravity of 7.15, and a composition indicated by the formula  $6HgS + ZnS$ , where some portion of the sulphur is replaced by selenium, and a still smaller quantity of the zinc by cadmium.

**Syngenite**.—At the forty-fifth Versammlung Deutscher Naturforscher held last month at Leipzig, Prof. v. Zepharovich (*Tageblatt*, 135) described a new mineral from the potash beds of the salt mines of Kalusz, in Galicia. It occurs with cubes of sylvine in colourless pellucid crystals that at first sight suggest selenite. Analysis proved them to have a composition corresponding with the formula  $CaSO_4 \cdot K_2SO_4 \cdot H_2O$ , showing it to be a substance nearly allied to polyhalite. The crystals are rhombic, and accord in every respect with the well-known laboratory product, except that they show a greater abundance of crystal faces. The hardness of this new mineral is 2.5, the specific gravity 2.73.

**Nitric Anhydride.**—At the same meeting, Prof. Weber described his method of forming the anhydrous acid by decomposing the most concentrated acid with phosphoric anhydride. This is added in small portions to the acid cooled in ice, and the mixture is then cautiously distilled. Two liquids pass over that are not miscible, the upper consisting for the most part of the anhydride, the other a new hydrate. From the former the anhydride is prepared by first gentle, then powerful cooling; hydrated compounds separate first, then the anhydride. The latter is without action on the majority of metallic substances, but reacts with great violence on the metalloids as well as on organic bodies. It is soluble to some extent in the strongest nitric acid, whence by cooling a crystallised hydrate evaporates, containing half the water of the monohydrate.—The author likewise exhibited crystallized phosphoric anhydride formed by sublimation.

### History.

**Tridentine Archives in Austria.** [*Zur Geschichte des Concils von Trient (1559-1563).* Actenstücke aus Oesterreichischen Archiven. Herausgegeben von Th. Sickel.] Wien: Gerold's Sohn.

It is partly, perhaps, to the Vatican Council that we may ascribe the increased interest felt of late in the history of the Council of Trent, but something is also due to the recent opening up of the Austrian archives to historical enquirers, which has for the first time given us access to many of the original documents. Thus, also, it has become possible to test the statements of the two great party Histories of Sarpi and Pallavicini. It is often said that by striking a mean between the opposite statements we arrive at the truth, but it is not so. The actual fact on which the two representations are based can seldom be reproduced exactly, in most cases we can only guess at it. It is a favourable instance when, after Sarpi stating that there was an actual treaty with France, and Pallavicini positively denying it, we find the fact to have been that there was a verbal agreement concluded. Sarpi's history has always been a favourite one in England, and we rather wonder at its not having been lately republished. Sarpi was so hostile to the Curia Romana (being a sort of "Old Catholic") that he could hardly venture to print his book in Italy. It was consequently first published in England by Antonio di Dominis, the famous archbishop of Spalatro (about whom we hear so much in James I.'s reign), under the patronage of Archbishop Abbot, who also induced Nathanael Brent, the warden of Merton College, to translate it, and the translation was published in 1620. Sarpi, who was born 1552, eleven years before the close of the Council, wrote soon after it, while it was still fresh in men's memory, and many who had been present were still alive, and he had the advantage of consulting many manuscript accounts. He says himself that

he had searched in "the writings of the prelates and others who were present in the Council, the records which they left behind them, and the suffrages or opinions delivered in public, preserved by the authors themselves or by others, and the letters of advice written from that city, whereby I have had the favour to see even a whole register of notes and letters of those persons who had a great part in those negotiations." He quotes, for instance (near the beginning of book ii.), "the register of the letters of the Cardinal of Monte." Pallavicini (*b.* 1607, *d.* 1667), on the other hand, wrote half a century later, and published his book 1664, when not a few of Sarpi's documents were no longer accessible. He had, however, the full use of the Vatican archives, and gives indispensable information, though sometimes omitting, and sometimes discrediting, genuine documents, *e. g.* the letters of Paul III. to the Emperor. On the whole, the papers published by Sickel confirm Sarpi in several of the disputed points, though a few of his dates appear to be wrong. (Even Pallavicini's dates are not always right.) A dozen years ago Sickel saw at Vienna a bundle of documents, containing, among other things, the preliminary rough draft of the "Articles of Reform" which the Emperor Ferdinand I. proposed to the Council, for the discovery of which Ranke, in his *History of the Popes*, expressed an earnest wish. At that time, however, the papers about the Council preserved at Vienna were purposely withheld from historical enquirers; now, under von Arneth's liberal management of the Record Office, things are very different, and Sickel has been enabled to treat the German documents on the plan which Dupuy adopted for those of France. His scheme combines an account of the proceedings relative to the Council with those relative to the whole intercourse between Pius IV. and Ferdinand I., though the materials have so grown on him that this volume only takes us down to the close of the Council in 1563. The discoveries at Vienna led him on to Innsbruck and Trent itself, where he found Professor Friedrich, of Munich, also engaged on making a catalogue of the materials for the history of the Council. Thence he went to Arco, in the Tyrol, where the correspondence of Prospero d'Arco is preserved, who was ambassador at Rome for Ferdinand I. and Maximilian II. from 1560 to 1572. Besides the original letters of the emperors and archdukes, there are many news-letters and some of "Pasquin's" satires from Rome (Sickel prints two of these as specimens). As his object is in the main to give only inedited matter, the editor has omitted all that is already printed in the great collection of Le Plat, in Döllinger's *Beiträge*, in Mendham's book, &c. (he does not mention the translation of some of Vargas' letters by Dr. Geddes). But the excellent notes often contain an abstract of these as well as of many inedited documents not worth giving *in extenso*. The book begins with July 1559, when the death of Paul IV. was expected. That pope had been a bitter enemy of the whole house of Austria; and, in fact, the quarrel between the papacy and the imperial power had contributed, perhaps more than any other external cause, to the establishment of Protestantism in Germany. The German ambassador had been even forced to leave Rome, and now the Emperor sends a despatch to his ambassador at Venice, ordering him to go to Rome the moment the news of Paul's death should arrive, and enclosing credentials for the Conclave and several friendly cardinals, one of whom, Morone, the statesman who afterwards successfully concluded the Council, had been actually imprisoned in St. Angelo. Paul died August 18, and the news reached Ferdinand at Munich by the 25th, but it had already reached the ambassador at Venice at four o'clock in the night of Sunday the 20th, and by the "24th hour of that day" he was on

shipboard for Rome, which he reached on the 28th. It is worth noting that the north post went out of Rome every Saturday, but special couriers were often despatched by the ambassadors. Once a letter reached Vienna in nine days, but usually it took a fortnight. Sometimes duplicate letters were sent by Venice and by Trent. The return post was much slower, and Arco is always complaining of it. The Emperor's letter of July 25 only reached him on August 22. At last the King of Poland established a post between Cracow and Venice, which rather improved matters for Vienna. Once Arco received nothing from the 28th of November 1560 to 28th January 1561, and then a whole bundle of despatches reached him together. The same difficulty of correspondence occurs between Spain and the Netherlands, and is not always enough allowed for by historians, e.g. as to the Spanish Armada. The Conclave of Cardinals received the ambassador gladly, and gave him his proper title and place, though Paul had up to his death refused to ratify the Emperor's election, on the ground of his consenting to the Peace of Passau, though it was rendered necessary owing to the defeat of Charles V. by Maurice of Saxony. Pius V., the new pope, was better disposed, and was even inclined to think the two concessions to the Protestants advised by the Emperor, viz. giving the cup to the laity, and the marriage of priests, which were not forbidden by God's law, but merely *juris positivi*, might be made. During the conclave itself the Cardinal of Augsburg was surprised at hearing him say so, and appeal to the concessions made to the Greek Church, and to those made by the Council of Constance to the Bohemians, and to Paul III.'s instructions to his legates in 1548. As to the question in dispute between Sarpi's and Pallavicini's accounts, whether it was the princes or the pope who first pressed for the assembly of a council, the documents do not quite settle the question. It is clear that Pius was urged on by the fear that Germany and France would summon national councils and perhaps settle the matter without him, as they threatened to do; but he was also himself anxious for a considerable reform, and behind both pope and princes there was the still greater power of the advancing tide of Catholic public opinion, which was rapidly hastening the counter-reformation. The Pope carried his point that it should not be a new council, but a resumption of the two previous meetings of the "Council of Trent," in 1545 and 1551, and this finally made a reconciliation with the Protestants hopeless. He also secured his legates the right of initiating measures, though Germans, French, and Spaniards, were united in opposition, but they were outvoted by the mass of Italian bishops, many of whom, being very poor, were partly maintained by the Pope. The whole details supply curious parallels to late events. Sickel gives a valuable note on the means employed to raise new taxes at this time in the Roman States, and the fruitless opposition of the municipal authorities. At last the Emperor despaired of gaining concessions for the Protestants from the Council, and the Great Powers consented to its close. It practically abandoned the claim of superiority to the papacy, put forth at the Council of Constance, and even asked Pius to make its decrees valid by ratifying them. The old view, however, survived in the Gallican Church, and the speech of the French envoy before the Council was very bold indeed. The Cardinal of Lorraine however was gained over, and Pius in general abandoning any open assertion of the old papal claims to rule over kings aimed rather at forming a close union with them, and especially with Philip of Spain. The speech of Lainez, the general of the Jesuits (reported p. 547), on the absolute power of the Pope and the uselessness of their discussions, gave excessive offence; but it showed practically how

things were going. It is questionable if a reconciliation with the Protestants was ever possible after Contarini's failure at Ratisbon, and the conduct of Paul III. and Paul IV. had allowed them time to strengthen themselves; but the Emperor was still powerful enough to maintain the religious peace in Germany, and was seconded in this by the Duke of Bavaria, though at Rome some were reviving the memory of Innocent III. and pressing for war, and the Pope would have liked to destroy "the sink of heresy at Geneva." The Thirty Years' War was not possible till Ferdinand II. of Austria and Maximilian of Bavaria succeeded, and through them the Jesuit influence became supreme. The germ of all these later events is to be traced in the documents before us, and there is a sense of reality in the vivid impressions of each moment as they are rapidly written down (the Emperor sometimes sent two or three successive letters the same day), which brings it all home to us far more than the best modern account, even that of Ranke, can do. And this is why the study of history cannot be profitably carried on without the use of original documents, since nothing else can reproduce for us the actual living men as they thought and spoke and lived, and surround us as it were with the atmosphere of the time. Pius IV. is especially well described to us as the pope of the transition. If there had been a pope of Hildebrand's ability, with the power to see that it was time to resign the dictatorship so long entrusted by Europe to the Italian see, the hopes attached to the assembly of a General Council which should be "free and oecumenical" might have been realised; but the system based on the false decretals was perhaps developed too thoroughly to admit of change; as in so many cases its past history determined its permanent course in one direction. There are a number of striking despatches given at length, such as Ferdinand's answer to the charges of Paul IV., his proposals of reform, two which describe the state of Bohemia, one on the state of Catholic Germany. The Emperor laments the want of able and moderate German theologians; the best were now on the side of the Protestants; there was no name to show like that of Melancthon. Canisius and Staphylus were of some service, and Gienger wrote a series of theological notes for the Emperor. Bavaria, too, sent Paumgartner to the Council. On all these there are excellent notices given. Some interesting despatches from Rome are sent by Cusano to Maximilian, who was then trying to secure his election as King of the Romans, but was suspected at Rome of being inclined to the Lutherans. Cusano sends all the gossip and the reports current in society, and Ferdinand is sometimes annoyed that his son hears of things before he does. So Arco finds it necessary to make his reports longer and give all the news, though often obliged to state its untrustworthy character. The ambassadors at Trent gradually began to see that their task was hopeless, and they and the Emperor became tired of the work. They complain (and the complaint occurs often enough in the contemporary despatches of English ambassadors) that their salaries were not paid, and at last they were so much in debt as to be almost unable to leave Trent. They repeatedly notice the objection of the bishops and wealthy clergy to have residence enforced, for then, as at a later time in England, non-residence was most common in the case of the rich livings, two or more of which were held by some influential person who did not reside on either. But the rising Catholic spirit proved too strong for them, and the disciplinary decrees of the Council enabled Cardinal Carlo Borromeo (Pius IV.'s nephew) and others to carry out the reform. There was great need to begin with the cardinals themselves, as Pius IV. showed by executing for his crimes Paul IV.'s nephew, Cardinal Caraffa. One leading complaint was that they were appointed too

young. Leo X. was made cardinal at fourteen, and men despaired of reform from Paul III. after they saw him appoint his two grandchildren—the one at the age of fourteen, the other sixteen—to the cardinalate. Pius IV. broke up the old Nepotism; and when it revived afterwards, it was in another form.

We cannot close the book without expressing our satisfaction with the almost perfect way in which it is edited. The notes and illustrations are everything that could be wished, and such as we should expect from the editor of the *Carolingian Charters*. Sickel has also published *Die Geschäftsordnung des Concil von Trient, aus einer Handschrift des vaticanischen Archives*, by the secretary of the Council, A. Massarelli, Bishop of Telesia. Nor can we omit a word of praise for the beautiful printing of the Roman type, both large and small, which some German publishers are now substituting for the old black letter which other nations have given up long ago. Of English affairs there is naturally only slight mention in the book. Ferdinand advised against the excommunication of Elizabeth, and interceded with her for the Catholic bishops: there is mention of a petition signed by the Bishop of St. Asaph. Of Russia there are several notices. The Pope wished to invite the Duke of Russia ("Moschus") and the Prince of Transylvania to the Council. The Emperor objected to both, the latter being a rebel and allied with the Turks against him in Hungary, while the former was ravaging Livonia and oppressing the German inhabitants there. It is curious that the Germans in Livonia are at this very time complaining of Russian oppression and appealing to the Fatherland—an appeal in which some see the germ of the next great European war. The whole book abounds with interesting matter. We trust that Sickel may be soon able to publish the remaining documents to the close of Ferdinand's reign and show us the first results of the decrees of the Great Council.

C. W. BOASE.

**Reports on the Discovery of Peru.**—I. Report of Francisco de Xeres, Secretary to Francisco Pizarro; II. Report of Miguel de Astete on the Expedition to Pachacamac; III. Letter of Hernando Pizarro to the Royal Audience of Santo Domingo; IV. Report of Pedro Sancho on the Partition of the Ransom of Atahualpa. Translated and edited with Notes and an Introduction by Clements R. Markham, C.B. London: printed for the Hakluyt Society.

OF the three (or four) reports contained in this volume, the more developed and interesting is certainly Xeres' narrative. Francisco de Xeres, the secretary of Pizarro, wrote his work in 1534, when sent in Spain to convey the first load of gold and silver that ever went from newly discovered Peru into the land of the conquerors.

As was very natural in a man suddenly thrown into an entirely new country, and understanding nothing or little of its native tongue, Xeres frequently commits blunders when speaking of things he did not know by eyesight, but only from hearsay. I am not astonished very much at minor improprieties of words, such as calling the Peruvian temples *mosques*, in which error Hernando Pizarro also concurs; their doing so was insomuch the more obvious that, as Mr. Markham justly observes, "the fathers of the Spanish conquerors had served in the campaign of Granada, and their minds were full of the things relating to the Moorish infidels." But there are mistakes of a more serious nature. Speaking of Atahualpa and Huascar, Xeres gives of their origin the most extraordinary account. He begins by calling their common father old Cuzco, Huascar being named all through young Cuzco, for distinction sake; and, in order that no one

may consider that as a mere slip of the memory and doubt his "mistaking the Piroeos for a man," he affirms that old Cuzco, our Huayna-Kapak,

"was a native of a province called Quito; but as he found the land where he was encamped to be pleasant, fertile, and rich, he settled there, and gave the name to a great city, where he lived, which was called the city of Cuzco. . . . It is eight years since he died, and he left as his heir a son of the same name as his own. He was a son of his legitimate wife. They call the principal wife, who is most loved by her husband, legitimate. This son was older than Atabaliba. The old Cuzco separated the province of Quito from the rest of the kingdom and left it to Atabaliba. The body of the Cuzco is in the province of Quito, where he died, and his head was conveyed to the city of Cuzco, where they hold it in great veneration, adorning it with gold and silver."

Now, there are almost as many blunders as there are phrases in this passage. Huayna-Kapak was not born at Quito, but conquered it, and took to his illegitimate wife the daughter of the Quiteño king, into whom he begat Atahualpa. The legitimate wife was not that whom her husband loved better, but must be the sister, or, at least, the first cousin, of the Ynca, of pure Ynca blood. As for Huayna-Kapak's dying at Quito and being mutilated after his death, in order that his head could be sent to Cuzco, the fact is that he died at Tumipampa, and was thence taken to Cuzco, where his body was discovered by the licentiate Polo in the year 1559.

Due allowance being made for these deficiencies, Xeres' narrative of the conquest is exceedingly interesting. Although it relate briefly Pizarro's early adventures and first tentative to conquer Peru, it really begins in the year 1530, when the author joined the decisive expedition, and became a witness with his eyes to the deeds he narrates so well:—

"Some portions of the story, here and there, are told in more detail by Herrera and other compilers, but in reading their versions we miss the feeling that the author was an actor in the deeds he narrates; and thus in Xeres there is a freshness and reality which no other published account of the conquest can impart."

The tale of Atahualpa's judgment and death will show to the reader the fitness of this appreciation, at the same time giving a good specimen of Mr. Markham's manner of translating.

"Then the governor, with the concurrence of the officers of his Majesty, and of the captains and persons of experience, sentenced Atabaliba to death. His sentence was that, for the treason he had committed, he should die by burning, unless he became a Christian; and this execution was for the security of the Christians, the good of the whole land, and to secure its conquest and pacification. For on the death of Atabaliba all his troops would presently disperse, and would not have the courage to attack us or to obey his orders."

"They brought out Atabaliba to execution; and when he came into the square, he said he would become a Christian. The governor was informed, and ordered him to be baptized. The ceremony was performed by the very reverend father Friar Vicente de Valverde. The governor then ordered that he should not be burnt, but that he should be fastened to a pole in the open space and strangled. This was done, and the body was left until the morning of the next day, when the monks, with the governor and other Spaniards, conveyed it into the church, where he was interred with much solemnity, and with all the honours that could be shown it. Such was the end of this man who had been so cruel. He died with great fortitude, and without showing any feeling, saying that he entrusted his children to the governor. When they took his body to be buried, there was loud mourning among the women and servants of his household. He died on Saturday, at the same hour that he was taken prisoner and defeated. Some said that it was for his sins that he died on the day and hour that he was seized. Thus he was punished for the great evils and cruelties that he had inflicted upon his vassals; for all, with one voice, declare that he was the greatest and most cruel butcher that had been seen among men; that for a very slight cause he would destroy a village, such as some trivial fault committed by a single man; and that he killed ten thousand persons, and held all the country by tyranny, so that he was heartily detested by all the inhabitants. . . ."

"Now I wish to mention a notable thing. It is that twenty days before that happened, and before there were any tidings of the army that Atabaliba had ordered to be assembled, it happened that Atabaliba was one night very cheerful with some Spaniards with whom he

was conversing. Suddenly there appeared a sign in the heavens, in the direction of Cuzco, like a fiery comet, which lasted during the greater part of the night. When Atabaliba saw this sign, he said that a great lord would very soon have to die in this land."

Xeres had embodied in his work Miguel Estete's report of "The Journey made by el Señor Captain Hernando Pizarro, by order of the Governor, his Brother, from the City of Caxamalca to Paricama, and thence to Xauxa." Don Miguel Estete, or Astete, de Santiago, the inspector, was the man who pulled the *Uautu* from the head of Atahualpa when he was dragged out of his litter. His narrative is precious especially when compared with the letter directed by Hernando Pizarro himself "To the Magnificent Lords, the Judges of the Royal Audience of His Majesty, who reside in the City of Santo Domingo." It was in Caxamalca, a few days after Atahualpa's capture, that Pizarro's brother "received permission from the governor to go to a *mosque* of which he had intelligence, which was a hundred leagues away on the sea-coast in a town called Pachacamá." Pizarro's expedition had no less an object than the famous temple of Pachacamac, described afterwards by Cieza de Leon and Garcilasso de la Vega. In his appreciation of the Pachacamac worship, Mr. Markham differs entirely from the commonly received opinion. He sees no adequate authority for such theories as make Pachacamac, "Creator of the World," a divinity older than the time of the Yncas, and whose worship the Peruvians of Cuzco adopted from another people.

"The inhabitants of the Peruvian coast called *Yncas* by their Ynca conquerors were an entirely distinct race from the people of the Andes, with a language differing both in its vocabulary and grammatical construction. . . . Their gods were made to give out oracles, and the shrines became rich and important in proportion to the credit they attained in forecasting events. Thus, there was a famous oracle in the valley, thence called *Rimac*, or "The Speaker," by the Ynca conquerors; and a still more renowned one was the fish-god in the city, afterwards called by the Yncas *Pachacamac*, to which pilgrims resorted from all parts of the coast. But this fish-god was not Pachacamac, nor was the word Pachacamac known to the people of the coast before they were conquered by the Yncas. It is an Ynca word, and is wholly foreign to, and unconnected with, the coast language. . . . The conclusions I have formed are that the worship of Pachacamac, the Creator of the World, was a part of the Ynca religious belief, and that it was wholly unconnected with the coast Indians; that there never was any temple to Pachacamac at the place on the coast to which the Yncas gave that name, for some reason now forgotten; that the natives worshipped a fish-god there under a name now lost, which became famous as an oracle and attracted pilgrims; and that, when the Yncas conquered the place, they raised a temple to the sun on the summit of the hill commanding the city of the fish-god, whence the glorious luminary could be seen to descend behind the distant horizon, and bathe the ocean in floods of light."

The fourth document in the volume is a mere piece of comptability, being a "Report on the Distribution of the Ransom of Atahualpa, certified by the Notary Pedro Sancho." It had been printed already in the *Vidas de Españoles célebres*, por Don Miguel José Quintana; but the notes Mr. Markham has appended to his translation give it a vast amount of interest. It has the nominal list of all the conquerors present in the town of Caxamalca on the 18th of June of the year of 1533, with the gold and silver that each one received, in different columns, beginning with the "Church, 90 marks of silver, 2220 pesos of gold; and the Lord Governor, for his person, his interpreters, and horse, 2350 marks of silver, 57,220 pesos of gold," down to Cristobal de Sosa, who got only 135 marks of silver and 3330 pesos of gold. Mr. Markham has tried to show what became of the men named in the document, and has succeeded in tracing the fortunes of some of them to the moment of their death. They were killed for the most part during the civil wars which broke soon over the newly conquered kingdom and troubled its early days so much.

G. MASPERO.

### Intelligence.

The death is announced of M. Roget, Baron de Belloguet, author of an *Ethnogenie gauloise*, which we shall soon review. Born in the year 1796, in the department of Haut-Rhin, M. de Belloguet was the son of a cavalry officer who became general under the first Napoleon; and he himself made, as a volunteer, the campaign of France (1815), during which he was, for his gallant behaviour, made Chevalier of the Legion of Honour, being only nineteen years of age. He remained in the army until 1834, when he retired from military service with the rank of chef d'escadron, to devote himself entirely to historical studies. His first works treated of some obscure points in the provincial history of Burgundy, and gold medals were awarded to them by the French Institute. In his later years M. de Belloguet directed his researches to the vexed question of Gaulish origins, and the result was his *Ethnogenie gauloise*, to which the "grand prix Gobert" was awarded by the Académie des Inscriptions et Belles-Lettres. M. de Belloguet died at Nice, the 3rd of August.

Clermont-Ganneau communicates to the Académie des Inscriptions three inscriptions, found at Jerusalem, of the Legio X Fretensis, famous for the share it took in Titus' siege, the last of which is ingeniously restored, but he makes a forced application of it to illustrate the dispute as to the site of the Holy Sepulchre. He would correct the text of the *Notitia Dignitatum*, which speaks of "Praefectus Legionis decimae Fretensis Ailae" (= Elath, on the Red Sea) by reading *Aeliae*, i.e. Jerusalem, then called by the Romans *Aelia Capitolina*.

K. Klüpfel's *Geschichte der deutschen Einheitsbestrebungen bis zu ihrer Erfüllung*, 1848-1871 (erster Band; Berlin, 1872), is an excellent continuation of a very good book by the same author: *Die deutschen Einheitsbestrebungen in ihrem geschichtlichen Zusammenhang* (Leipzig, 1853). The author, who, in his South German position, has been for many years a staunch and faithful supporter of German unity, hails the present fulfilment of the ideal of his youth from the bottom of his heart. He has taken up the work once more with the year 1848, being able to give a much fuller and riper account of the exploded, yet nevertheless fruitful, endeavours of that stormy period of German politics. Klüpfel is a master of lucid arrangement and sober judgment, disdaining all unnecessary trammels and matters of minor importance in a book chiefly destined for political instruction. His work proves again how much a sound and honest literature in favour of an indivisible German government has obtained the upper hand over the scared defenders of the sovereignty of the single states and their lame and loose confederation. Foreigners who wish to inform themselves in the history of the national mind within the last twenty or thirty years will not easily meet with a better guide.

The newest volume of Ranke's Collected Works, viz. vol. xxiv., offers the first instalment of dissertations and essays, either originally written for a periodical, which the author edited for a short time about forty years ago, or read in the Royal Academy at Berlin. The greater portion of these essays deal with Prussian history, the memoirs of Baron de Pölnitz, and the Marchioness Wilhelmina of Bayreuth, with one of the historical works and the correspondence of Frederic the Great with William IV., Prince of Orange, and his wife, a daughter of George II. Two essays, however, are of a more general bearing, especially the first, treating about the great powers, France, England, Austria, Russia, and Prussia, in their relation to the French revolution—a consummate and highly finished sketch by a master hand. The second discusses the chief political theories of modern ages, those of the Jesuits as well as the doctrine of absolute sovereignty of temporal government. In the appendix is found a clever speech in Latin: "De historiae et politicae cognitione atque discrimine Oratio," delivered by Ranke in 1836, when taking possession of his chair in the university of Berlin.

At the annual meeting of the historical commission at Munich progress was reported of several of the society's publications. The most important of them for the ensuing year will be the beginning of a *Biographia Germanica*, a biographical cyclopaedia for Germany, of which a couple of volumes, containing letters A and B, are ready for the press, thanks to their indefatigable editor, Dr. von Liliencron, to whom the great collection of the historical poems of Germany had been entrusted by the commission some years ago.

### Philology.

Dr. Volkmann's Greek and Roman Rhetoric. [*Die Rhetorik der Griechen und Römer*. In systematischer Uebersicht dargestellt von Dr. Richard Volkmann, Gymnasial-Director in Jauer.] Berlin : H. Ebeling and C. Plahn.

THE very importance of Technical Rhetoric for the ancients has in one way interfered with modern appreciation of their work in that field. For at least six centuries after Aristotle the theory of Rhetoric went on being elaborated or refined. Its place in a liberal education and its bearing on practical life not only drew to it a host of special students, but led men who took all knowledge for their province to feel at least a condescending interest in its development. "It is base to be silent, and let Isokrates talk." A few leading principles of Rhetoric were early seen, and the ground-plan of an art was laid down; but, when this had been done, an enormous amount of ingenuity and acuteness continued to be spent in stating and re-stating these principles from new points of view, in dividing and subdividing the ground according to new schemes, in devising new and more subtle terminologies. "The ancient Rhetoric," says Dr. Volkmann, "is no capricious medley of unmeaning, pedantic rules, but a system in the highest degree simple and convenient, . . . clear, and easy to survey." This is true in the sense that a few general conceptions may be traced in different forms through all the technical writings, and that (as Dr. Volkmann's book proves) it is possible to give the net result of these writings in a compact shape. But on the other hand it can hardly be denied that the principles of ancient Rhetoric came to be overlaid by a mass of rules and technicalities which may fairly be called pedantic—the result of ingenuity accumulated where exactness was impossible. Ernesti's lexicons, books on special periods such as Spengel's *Συναγωγή Τεχνῶν*, or commentaries on individual technicians, have hitherto been the chief helps for students of the subject. Following up his work published in 1865, *Hermagoras; or the Elements of Rhetoric*, Dr. Volkmann gives in his present book a complete digest of Greek and Roman Rhetoric.

He has not brought into special prominence any one authority or group of authorities, or any one period, but has sought to reduce under certain heads the entire lore of the subject. He takes like account (for instance) of Anaximenes and Aristotle in the earlier age, of Cicero and Quintilian in the middle, of Hermogenes and Apsines in the later. His book is a handbook, serving two purposes—the interpretation of the technicians and the illustration of the orators.

The difficulty of such an attempt consists first of all in this, that the systems of different writers vary not merely in details but also in the manner of viewing or applying principles and in the partition of the whole field of Rhetoric. For instance, Aristotle made the provinces of Rhetoric to be Invention, Expression, and Arrangement. Theophrastus added Delivery (*ὑπόκρισις*). Mnemonics come in as a fifth part in later systems. The doctrine of the *στάσεις* is limited by some writers to "causes" (*ὑποθέσεις*), extended by others to theses; the general topics of the enthymeme are classified on several radically different plans. Dr. Volkmann's method in such cases is to give a prefatory notice of the various different arrangements, and then to take for closer treatment and illustration the arrangement which he thinks best. His book, then, is much more than a compilation: it is an effort to bring out of systems differing in more or less important respects the ground-ideas common to all; to set these in the clearest light; and to illustrate them by examples. He disposes his materials under five heads: 1. Invention; 2. Arrangement; 3. Expression; 4. Memory; 5. Delivery—the province of Invention being subdivided as it concerns Forensic, Deliberative, or Epideictic speaking.

The first special point to be noticed in Dr. Volkmann's book is his explanation and analysis of the *στάσεις* (pp. 23-63). His original and peculiar merit here consists in the clearness with which he points out the one great source of confusions and discrepancies in the technical writers on this subject. The elements of the *στάσεις*, the *constitutio* or *status causae*, are an affirmation and a denial: the *στάσις* is the question at issue as it arises on the first conflict of opposite assumptions. Hence it is only a forensic speech which can properly be said to have a *status*, and this *status* is always determined by the accused, never by the accuser. A deliberative or epideictic speech cannot properly be said to have a *status*, since there is no need to "constitute" at the outset the question under discussion. Most of the ancient writers on Rhetoric missed this distinction. Cicero and Quintilian give a *status* to every *quaestio civilis*, deliberative or epideictic as well as forensic, and so Hermogenes to his *πολιτικά ζητήματα*. Again, Dr. Volkmann shows very well how the classification of *στάσεις* is not a barren pedantry, but has a direct practical use for the criticism of oratory. By way of example, he defines the *στάσις στοχαστική* in the speech of Demosthenes *De Falsa Legatione*; and then, applying this definition, estimates the comparative merits of the speech as an argument and as a work of art.

His account of the rhetorical syllogism and of the technical terms connected with it is another instance of clear and concise statement. "Enthymeme," as he says, was originally the general name for the rhetorical syllogism, whether formally complete (*i.e.* consisting of three propositions) or incomplete; but as the rhetorical syllogism is often incomplete, the enthymeme came, after Aristotle's time, to be defined simply as a shortened syllogism (*e.g.* Quint. v. 10, § 3); and then "epicheireme" became the term for the complete, as opposed to the incomplete, rhetorical syllogism. It might have been worth while, in illustration of this, to have referred to Aristotle's statement (*Rhet.* i. 2) that the enthymeme is a syllogism *ἐξ ὀλίγων τε καὶ πολλῶν*—*ἐξ ὀλίγων*

τόνων ἢ ἐξ ὧν ὁ πρῶτος συλλογισμός. The *πολλάκις* here seems often to have puzzled commentators who had in mind the *later* definition of the enthymeme as a shortened syllogism. This may be seen by looking at a note on the passage in Parsons' commentary (Oxford, 1836), where it is suggested that *ἐλαττώων* possibly refers to the *number of words* in which the enthymeme is stated.

In the second division of his book, Dr. Volkmann notices the comparative neglect of Arrangement by the technicians. Invention or Expression were at first the only recognised provinces; and even Aristotle, though professing to treat Arrangement separately (*Rh.* iii. cc. 13-19), virtually leaves the province of Invention only in one part of c. 17. Dr. Volkmann takes the *οἰκονομία* of Dionysius as the basis of this part of his work, and examines it under its three subdivisions—(a) *τάξις* proper—general rules about the marshalling of arguments; (b) *διαίρεσις*,—a minute analysis of the varieties of each *status causae*; (c) *ἐξεργασία*—the elaboration of proofs, for which Dr. Volkmann refers back to the sections on the *ἔντεχνοι πίστεως* (pp. 207, f.).

In the third division of the book—that relating to Expression—Dr. Volkmann has achieved the formidable task of defining and illustrating the principal tropes and figures known to ancient Rhetoric; and has stated clearly the essential difference, often overlooked, between *τρόπος* and *σχῆμα*: the trope is concerned with particular words used in an abnormal sense; the figure is concerned with groups of words used in their normal sense for the artificial expression of a thought: so that—according to a neat saying quoted by Dr. Volkmann from one of the late rhetoricians—a trope is to a figure as a barbarism to a solecism.

The special difficulty of Dr. Volkmann's task lay in its first part, the topic of Invention: it is here that his grasp of the whole subject is best seen, and that the help which he gives is worth most. But the other parts have been worked out with no less care and thoroughness. The book is what it aims at being, and what did not exist before—a complete handbook of Greek and Roman Rhetoric.

R. C. JEBB.

Conington's *Persius*. [*Persius*; with a Translation and Commentary by Conington.] Edited by H. Nettleship. Oxford: Clarendon Press Series.

IN some respects this posthumous volume is even more delightful than the great edition of Vergil. The charm of that was the way in which the anxious delicacy of the editor reflected one whole side of Vergil which had never been adequately brought out before. But Vergil and the Vergilian literature are too extensive a subject to be presented as a whole at the present day, especially by a scholar so scrupulously thorough as Mr. Conington, who could never leave a line of investigation without exhausting it. *Persius* is not too vast to be studied on all sides, and Mr. Conington had enough in common with him to appreciate him, while his uniform suavity and sanity form a complementary contrast to the terse obscurities and the abrupt refinements of the poet of Volaterrae.

The introductory lecture on the life and writings of *Persius* brings together very pleasantly what is known of the satirist, with many ingenious *aperçus* on the origin and development of Roman satire. It may be a question whether, as *Persius* always writes in the tone of a man perfectly at ease under the imperial system, it was worth while to repeat *à propos* of *Persius*' stoicism the usual unsoft commonplaces about the antagonism of the porch to the empire; and—though it is undeniably plausible and

suggestive to compare Roman satire as an advance upon Greek comedy with the great progress achieved in general literature when prose detached itself from poetry—we could have wished the suggestion accompanied by an explicit acknowledgment that there are no grounds aesthetic or historical for placing Roman satire, or any other satire, on a level with Greek comedy; that the greater richness of content in comedy always must outweigh anything that has been gained in force in satire. Still the point is an interesting one, and Latin literature is so generally depreciated that it may have been better not to encumber the suggestion with reserves. Another suggestion which we hope to see carried further is that *Persius* was a deliberate and direct imitator not only of *Horace*, but of *Lucilius*.

The translation is simply admirable. Mr. Conington has kept all *Persius*' point and condensation, all his dry humour and his chastened geniality. He is sufficiently like him to give a triumphant answer to the question whether he is worth reading apart from his difficulties; and where he is unlike him, it is because he improves upon him, and attains to the uniform level of poignant refinement which *Persius* pursued through so much quaintness and affectation. Of course neither the translation nor the commentary are to be taken as representing the final views of the author, though the first thoughts of Professor Conington were riper than the third thoughts of many men. Perhaps the most ingenious new interpretations are on i. 85, which is connected with *Hor.* i. s. 10, 28, as follows: "Even the eloquence of the bar, to which *Horace* would point as a genuine unaffected thing, has caught the taint; even our *Pedias*es talk like schoolboys and pedants;" and vi. 11: "So says *Ennius*' brain when he had been roused from dreaming himself *Maeonides Quintus* developed out of *Pythagoras*' peacock," as if *Ennius* called himself *Homer* in addition to his own name *Quintus*; as Mr. Conington points out, if the traditional explanation that *Ennius* was five transmigrations off the peacock were correct, we ought to have had *ab* instead of *ex*. The comment on i. 124, *Pallere Eupolidem*, which is explained as "*pallere pallorem Eupolideum*," is certainly ingenious; but we hardly see why the analogy of *sabbata palles*, v. 184, should have been so emphatically rejected. Nor is the difficult passage, ii. 18-20, quite satisfactorily treated. The traditional reading and explanation were quite satisfactory from a literary point of view. "What is your view of *Jupiter*? Should you care now to put him above anybody?"—"Above whom?"—"Well, above *Staius*; why bear you any doubt about it? which of them is the most desirable judge, and the fittest guardian for a lot of orphan boys?" If this is rejected on the grounds that there is more MS. authority for "*cuinam*?"—"Cuinam?" than for "*cuiquam*?"—"Cuinam," and that no Roman poet could have used "*quis*" with a comparative for "which of the two;" it would surely be better to give v. 20 to the interlocutor that the connection might be, "Can you hesitate about putting *Jupiter* first?"—"Why, *Staius* is a most respectable man; who more so?"—"Well, then, if you have much confidence in him, go and tell him what you've just told *Jupiter*." On iii. 25, it is at least a question worth discussing whether *purum et sine labe salinum* is not to be compared with *Juvenal*, x. 19, *Pauca licet portes argenti vascula puri*, so that the sense would be, "You've a tidy little stock of corn and a tidy little salt-cellar, no chasing on it and no stain either." v. 33, *jam candidus umbo*, is translated, "the yet unsullied shield of my gown;" of course the *yet* is a license, not an oversight, but as the translation was in prose, it is to be wished that the commentary had indicated the fact for the benefit of tyros. vi. 64, *minui mihi* is not quite clearly explained in the commentary, and over-explained in the translation; the

sense surely is not, "I have robbed myself for myself," but, "the diminution only affects me"—[not you, who never possessed the undiminished total]. It is curious that none of the commentators have quoted from Aeschylus, Fr. 371, *οἱ τε στέναγμοι τῶν πόνων ἐρείσματα*, which is almost certainly directly or indirectly the original of i. 78, *Antiope acrumnis cor luctificabile fulta*.

It may seem ungracious to criticise what has evidently been a labour of love, but it is to be wished that in a second edition some errors of the press may be corrected, and one or two obvious incompletenesses either supplied or removed; e. g. vi. 11, we have the following: "Homer's revelations, however, turned on the doctrine of metempsychosis, he having been a peacock at one stage of the process (note on Prol. 3)"; where there is not a word about peacocks. Is it barely possible that Mr. Conington suspected an allusion to the fable of the daw and peacock at Prol. 13?

G. A. SIMCOX.

**Vocabulary and Handbook of the Chinese Language.** Romanised in the Mandarin Dialect. In Two Volumes. By Rev. Justus Doolittle. Vol. I. Foochow.

IF the frequent appearance of Chinese dictionaries, vocabularies, and grammars be a proof of an increasing interest among European students in the language of China, it is certain that the taste must be fast developing. A few years ago the number of Chinese-English or Chinese-French dictionaries in existence might have been counted on the fingers of one hand; now as many are published each year. Some of these, as may be supposed, might, for all the practical good they are likely to be to students, as well have remained unpublished, but from most there is something new to be learned, and these will at least form valuable aids to the future compiler of the dictionary which will be to the students of the future what Morrison's great work has been to the past generation of learners. The work before us is undoubtedly entitled to a place in the latter category. The information it contains is considerable, and though exception might be taken to the somewhat loose style in which the materials are put together in its pages, it will doubtless prove itself to be of valuable assistance to beginners in Chinese. Its author has availed himself of the results of the labours of former workers in the same field, and has been able to supplement the matter furnished by them by a careful personal study of the language extending over many years. Mr. Doolittle divides his work into three parts. The first, the only one which is now before us, consists of the vocabulary proper, and is complete in itself. Its author tells us that it contains more than 175,000 Chinese characters in over 66,000 expressions from which all local phrases have been strictly excluded. The second part contains a number of clauses and phrases alphabetically arranged, relating to a large variety of subjects, among which are to be found many popular proverbial and classical expressions. And in the third part are collected lists and tables of terms and phrases contributed in answer to the invitation of the author by members of the consular and customs services, and missionaries, resident in China. Of this last part we can speak only from the information conveyed to us in the preface to his present volume, and if the plan there proposed be carefully carried out, the result will doubtless prove a great gain to students of the language. One great stumbling-block in the way of every learner of Chinese is the difficulty of acquiring a knowledge of the numerous varieties of style and expressions peculiar to the different branches of the literature. For instance, a student who had devoted his attention entirely to the Buddhist works of China would be sorely puzzled were he asked to translate

a passage from the writings of a classical author, and in like manner one conversant only with the latter style would be quite unqualified to render, at the moment, the meaning of a document written in the modern epistolary style. The advantage therefore of having a vocabulary which shall embrace terms and phrases variously common to the different styles is obvious.

The nature of the contents of this part of Mr. Doolittle's work will of necessity preserve it from one fault which, were we inclined to carp, we should find with the present volume; we mean the extreme redundancy of the common Chinese equivalents of the English words. For instance, under the heading "Day" and "Days," he gives us no fewer than twenty-two phrases, most of which might have been left to the intelligence of students enlightened by other pages of the vocabulary. This fault, however, is one of which beginners are not likely to complain.

ROBERT K. DOUGLAS.

### Intelligence.

University College, London, has recently set an example which certain venerable but inert institutions in this country would do well to follow. The brochure (of 17 pages) before us contains three "Professorial Dissertations for 1871-72," written on the model of the German "Programmes," to which all serious students are so deeply indebted. The mathematical contribution of Professor Henrici, "On the Construction of Cardboard Models of Surfaces of the Second Order," cannot be more than mentioned here. Professor Robinson Ellis examines sundry passages in Propertius, and criticizes at some length the couplet ii. 2, 11-12: "*Mercurio satis fertur Boebeiis undis Virgineum Brimo conposuisse latus*"—where he pronounces the reading *satis* both metrically and historically defensible, though the harshness of the asyndeton leads him to conjecture *satiis*. Professor Key's discussion "On Latin Words commencing with an *F*, especially *ferrumen*, *ferruminare*, as standing in Lexicons," involves the interesting result that *ferumen* (for this seems to be the true orthography) is immediately related to *fermentum*, as *legumen* is to *legmen*; and that the word was first used of the effervescent mass seen in the slaking of lime for the purpose of making mortar, and so came eventually to signify mortar. Let us add that some valuable remarks on Plautus are incidentally introduced.

In a meeting held some time ago by the leading Greeks of London under the presidency of Sir Peter Armeni Braila, the Greek ambassador, a considerable sum was subscribed towards the realisation of a plan highly honourable to the Greek nation. Committees have been formed at Marseilles and Paris for the purpose of conveying the remains of Adamantios Koraës, the founder of the present literary dialect of Greece, from Paris to the native soil of Hellas, and of reprinting and distributing his editions and works (which have now become very scarce). We consider the first part of this plan as an act of piety deserving of the greatest praise, but are even more rejoiced at the second part, which will be a benefit to the nation at large. We, however, wish that the committee should appoint a number of scholars, qualified to superintend the reprints of Koraës' editions, and that the results of modern criticism should be made available for these reprints. It would be an illusion to assume that the Koraës' editions of Isocrates, Strabo, and Plutarch, were absolutely perfect; nay, admirable as the notes are, the texts of these editions leave very much to be desired. It would not be wise to put into the hands of young studious Greeks antiquated texts of some of their best writers. The text of Koraës' original editions might be kept, but the deviations of the best critical editions of our time should be added in foot-notes, and brief discussions might elucidate the reasons and different merits of each reading. We hope that the committee will take this point into consideration, otherwise they will not be acting in the spirit of Koraës himself, who was a true scholar and critic, and who, could he return to the *ἄνω νεκροί* (as Aristophanes has it), would not claim for his works the halo of infallibility.

Mr. E. Legrand has recently added to his *Monuments pour servir à l'Étude de la Langue néohellénique* the "editio princeps" of the curious poem, *περὶ τοῦ γέροντος τοῦ φρονίμου Μουτζοκουρμένου*, in 384 trochaic lines, with a beginning in iambic lines. The notes are excellent, and contain some valuable contributions by that excellent scholar Mr. George Wyndham, to whom we owe also a learned commentary on M. Legrand's second edition of the *Ἱστορία Ταγματίρα*.

M. C. Sathas' *Μεσαιωνική Βιβλιοθήκη* has now progressed to the third volume. It will also contain a large mediæval epic poem recently discovered at Trapezunt, and of which the poem entitled *Ἡ Ἀναγνώρισις*

(Wagner's *Mediaeval Texts*, i. p. xxii, sqq.) turns out to be merely a fragment. The new discovery promises to be very important, the poem amounting to something like 3000 lines. M. Büdinger's conjecture as to the hero of the poem 'H' *Avayvápias*, can be shown to be quite unfounded.

**Sanskrit Manuscripts.**—Dr. G. Bühler has issued, for the Bombay Government, the second and third fasciculi of his *Catalogue of Sanskrit MSS.* from the private libraries of Gujarāt, the former including 1339, the later 728, separate MSS. Of those of No. 2, 214 belong to the *Purāṇas*, among which appear the following new names: *Aditya*, *Aṅganaśa*, *Kalki*, *Kāpila*, *Chandīya*, *Durvasasa*, *Pārthara*, *Puruṣottama*, *Mānava*, *Māhevara*, *Varuṇa*, *Sarasvatī*, *Sāmba* and *Saura Purāṇas*. Next come 238 MSS. belonging to 78 different *Māhātmyas*, many of which Dr. Bühler thinks will be useful for the student of the geography of Gujarāt. The heading, "*Rāmāyana* and *Mahābhārata*," includes 137 MSS.; "Artificial Poems," 252 MSS. The last-mentioned division includes many works made known for the first time by this list; though Dr. Bühler doubts whether any of the new discoveries will prove to be of any great importance, as they seem worthy to belong to the modern sectarian and court poets of Gujarāt and the adjacent provinces. The chief value of the list, he thinks, will consist in the numerous old and very good MSS. of the great classical works, and of their commentaries. A complete exploration of the Jaina libraries may perhaps furnish some of the older poetical works which are now only known by name. A recovery of this kind was that of Bāṇa's *Chandīkātaka*, noticed by Dr. Bühler in the *Indian Antiquary* of April last. The next division, "Dramatic Poetry," contains 125 MSS. of 36 different works; that of "Fables and Tales" includes 10 works in 39 MSS. Finally, there are 29 MSS. under the heading "Historical Poems and Pieces," among which Bāṇa's *Śrīharṣacharita* is important. The MS. breaks off in the eighth or last canto of the poem. The third part contains, on grammar, 139 MSS., including copies on most of the standard works, several works on *paribhāṣā*, Hemachandra's *Dhātupāṭya*, &c.; 49 MSS. of *kośas* and their commentaries; 89 MSS. on rhetoric; 32 MSS. on metrics; and finally, 419 MSS. on Hindu law. We hope that the plan of more detailed notices of these MSS. to be published as soon as the survey is concluded, has not been abandoned by the Bombay authorities.

Bābū Rājendralāla Mitra has likewise printed, for the Bengal Government, a new number, the fourth, of his *Notices of Sanskrit MSS.* Of *Vaidic* works, it includes accounts of MSS. of the *Māyaka Kalpa Sūtra* of the *Sāmaveda* (No. 654), with the greater part of a comment by *Varadarāja* (No. 664); a commentary, by Anartīya, on the *Sāṅkhyaṇa Kalpa Sūtra* (No. 665); the *Baudhāyana* and *Āpastamba Śulvasūtras* (Nos. 655 and 657), the former with a gloss by Dvārkanātha (No. 656); Kātyāyana's *Grihyasūtra* (No. 658), and an *Āpastambīya Gārhyakarmaprayoga* (No. 662);—on rhetoric, Jayadeva's *Chandrāloka* (No. 605), and Nyāyavāgīṣa's *Kavyachandrikā* (No. 639);—further, a MS. of the *Rājāvālī* (No. 559), and an incomplete one of a *Prākṛit Grammar* (No. 551), different from those hitherto known;—also Kamalākaraḥṭṭa's *Sūtradharmatattva* (No. 607), and Halāyudha's *Brāhmaṇasvarva* (No. 652).

Mr. Childers supplements his review of M. Fausböll's *Ten Jātakas* (*supra*, pp. 381–383) with the following philological remarks:—Some of M. Fausböll's notes are, I think, open to criticism. Thus he seems to have misunderstood the phrase *chandādivasena agantvā* (see p. 88), which as it stands is correct and offers no difficulty. By *chandādi* are meant the four *agatī's*, *chhanda*, *dosa*, *moha*, *bhaya*; and *chhanādivasena agantvā* merely means, "not walking under the influence of the four evil passions, desire, anger, error, and fear." M. Fausböll finds fault with my identification of *attha*, "a lawsuit," with *अथै*: he observes that *अथै* usually becomes *attha*, and asks why the aspiration has been dropped. But there is really nothing singular in this: *अथै* becomes *attha* when it means "thing" or "cause," and *attha* when it means "lawsuit;" just in the same way that *वर्तते* becomes *vattati* when it means "to be," and *vattati* when it means "to behave," or that *अन्यत्र* becomes *aññattha* when it means "elsewhere," and *aññattra* when it means "except." As to the loss of the aspirate, it has numerous analogies, as, for instance, *nandī* = नन्दी, *loddā* = लोद्ध, *majjhato* = मध्यस्थ. My explanation of *bhane* (p. 100) does not admit of any doubt, and so far from being in any way equivalent to *bhante*, it is a familiar expression generally used by a superior to an inferior. The only possible objection to my identification of *chhāta* with *च्यत* (p. 96) is the difference of meaning, and this has little weight when we consider the innumerable cases in which a word has a different meaning in Sanskrit and in Pali. M. Fausböll

would refer *chhāta* to *च्य*; and in an elaborate note he denies the identity of *च्यति* with *jhāyati*, "to waste away, to be consumed, to burn," and traces *jhāyati* and *jhāpeti* to *दह*; through the supposed causative forms *d(a)hyayati* and *d(a)hyāpayati*. But, in the first place, the Pali *jhāyati* is not a causative, since it means "to be consumed;" secondly, *dhayayati*, as M. Fausböll admits, does not account for the long *d*; and, thirdly, the fact that *jhāma* = *ज्जाम* is the participle of the perfect passive from *jhāyati* conclusively proves that Bollensen is right in referring *jhāyati* to *ज्ज*. The causative *jhāpeti* is clearly identical with the Sanskrit *चापयति*, from *चा* or *चि*. The objection that it would be the only instance of *ज्ज* becoming *jh* in Pali is not really a serious one, for we know that an initial *ज्ज* always becomes *s* in Pali except in the two words *ज्जव* and *ज्जव*, which become *chhava* and *chhāpa* respectively. Finally, I may observe that the pres. pass. *दहते* is in common use in Pali under the form *dayhati*, and that the original meaning of *jhāyati* is "to waste away," as will be seen from *Dhammapada*, verse 155. The note on *tappeti*, "to scorch" (p. 94), is interesting, and the explanation I believe to be correct: parallel instances are found in the coexistence of the forms *jānu* and *jannu*, *kapāla* and *kapalla*, &c. The form *ninnāda* = *निनाद* (p. 94) is explained by the fact that the prepositions *नि* and *निस्* are to a certain extent interchangeable in Pali: compare *nibbuddha* = *नियुद्ध*. *Naṅguṭṭha* (p. 99) undoubtedly represents the Sanskrit *लाङ्गुल*, but with a termination *स्य* instead of *ल*: compare *चङ्गल* with *चङ्गुल*. *Sindhava* (p. 106) is certainly *सिन्धव*; in Pali *vṛiddhi* is frequently omitted before a double consonant: compare *maṇḍappa* = *माण्डप*, *suttika* = *सौत्तिक*, *buddha* = *बौद्ध*, *muggarika* = *मौहरिक*.

Sig. Lasinio, of Pisa, is bringing out an accurate edition of the "middle comment" of Averroes on the *Poetics* of Aristotle. The Hebrew translation, by Tōdrōs Tōdrōsā (fourteenth century), forming the second part, has already appeared. The first part is to contain the Arabic original; the third, the general introduction, the two Latin translations, and an Italian one by the editor. It seems that the quotations from the Hebrew given by Eichhorn in his *Bibliothek*, vol. vii., were full of inaccuracies.

### Contents of the Journals.

**The Indian Antiquary**, part vii. (July).—Popular Tamil Poetry; by R. C. Caldwell. Second paper. [Kamban's version of the *Rāmāyana*, which Beschi so successfully imitated in his *Tembāvani*, is perhaps the most popular poem with Tamilians, although, when sung to a crowd in bazaars by wandering minstrels, it requires a running commentary to explain the meaning of the verses as they are recited. The works of the great poetess Auveiyar (probably in the tenth century) contain perhaps the oldest specimens of Tamil popular poetry extant, and they are written in clear pure Tamil. She is chiefly noted for her unrivalled collection of brief moral aphorisms. Another poem, the *Mudurei*, occupies a foremost place in Tamil literature. It has been assigned to Auveiyar but for one, may be spurious, stanza, in which the turkey is mentioned, a bird introduced into India by the Portuguese about three hundred years ago. Some of Pattanattu Pillai's writings rise to the level of Sivavakkiyar, but as a whole they are characterized more by melodious verbiage than striking thought. The *Sūttar* (Siddha) school, the poetical quietists of the Tamil country, have furnished some pretty poems. Another favourite poem, especially with women, is the *Vīreka Chintāmani*, a comparatively modern production.]—On the Gauli Raj in Khandesh and the Central Provinces; by W. F. Sinclair. [The writer conjectures that Gauli was the surname of a family of princes (and not of a nation) of Aryan race, who established themselves in the valleys of the Tapti and Narmadā during the great migration southward, which ended in the colonization of the Dekhan by the Aryan Marathas.]—An Inscription at Sālotgi in the Kālādgi District, dated Saka 867, or A.D. 945, with Remarks; by Shankar Pandurang Pandit. [This inscription, of which a facsimile is given, is in Devanāgarī, engraved on three sides of a stone pillar. Beneath the Sanskrit inscription there is another independent inscription in the Hale Canarese, likewise recording a grant of land by a Mahāmaṇḍalesvara. The village lies south of the Bhīmā and Solapur. The grant was issued during the reign of the Rāshtrakūṭa king Krishnarāja, surnamed Akālavarsha, son of Amoghavarsha, residing at Mānyakheta. The writer identifies

this king with the twelfth king in the list recorded on the Kardâ plate, and refutes Wilson's suggestion as to there having been two collateral branches of the Râshtrakûta Yâdavas.]—Folklore of Orissa; by J. Beames. [Continued. A spell for snakes.]—Legend of the Origin of the Tungabhadra River; by V. N. N. [From the *Bhavishyottara Purâna*.]—The Sacred Fire of the Pârsis at Udwaîlâ; by W. Ramsay. [Account of the old Dastur or chief priest of the place as to how the sacred flame was first set up by the Pârsis after their flight from their country to the Konkan. Also a translation of sixteen Sanskrit shlokas, in which their Mobeds are said to have explained their religion to the Râjâ when they landed in the kingdom of Sanjân, in the early part of the eighth century.]—Notes on the Rasakallôla, an ancient Oriya poem; by J. Beames. [This poem, the most popular in Orissa, was composed by Din Krishna Dâs, a Vaishnava at the great temple of Jagannâth at Puri, who probably lived in the latter part of the fifteenth century. The poem consists of 32 cantos, or about 4000 lines, each beginning with the letter *k*, and treats of Krishna's life and adventures.]—Bengali Folklore; by G. H. Damant. [Continued. Legends from Dinajpur.]—Rock Inscription in Ganjam District. [From the *Proceedings* of the Madras Government, with a note by R. G. Bhandarkar.]—Asiatic Societies.—Review (favourable) of the Rev. A. Bouteloup's *Philosophia Indica Expositio*, Bangalori, 1868.—Miscellanea, &c. [Tipera and Chittagong Kukis.—The Triviyar Festival.—Note on the root "tap"; by J. Beames.—Derivation of "elephant" from Dravidian *âne* or *âle*, the elephant, and Sanskrit *airâvata*; by F. Kittel.]—Part viii. (August).—The Oldest known South Indian Alphabet; by A. C. Burnell. [The alphabet referred to is that used in three Tamil-Malayalam copper inscriptions in possession of the Jews and Syrians at Cochin. The two oldest are those by which these two communities were originally established. That of the Syrians Mr. Burnell supposes to be engraved in A.D. 774; none of the three being probably later than the early part of the ninth century. This alphabet is said to have once been used throughout the Tamil and Malayalam country, but chiefly in the extreme south. Mr. Burnell derives it from Egypt through the Phœnicians, and maintains the Pâli alphabet of Aśoka's edicts to be nothing more than an extension of this alphabet.]—Sketches of Mathurâ; by F. S. Growse. [Continued. Account of Gobardhan, a famous place of Hindu pilgrimage, fifteen miles to the west of Mathurâ.]—On the Dravidian Element in Sanskrit Dictionaries; by the Rev. F. Kittel. [List of supposed Dravidian words that occur in Sanskrit dictionaries under the letters *a* and *â*.]—On the *Râmâyana*; translated, from the German of A. Weber, by the Rev. D. C. Boyd. [Continued. The essay endeavours to show that the plot underlying the *Iliad* was known to the author of the Sanskrit epic.]—Archæology in Bombay Presidency; extract from the Administration Report for 1870–71.—Asiatic Societies.—Correspondence. [Age of Indian Caves and Temples.—Note on the Gauli Râj.—The Khajûna language.]

Journal of the American Oriental Society, vol. x. No. 1.—Vocabulary of the Ponape Dialect, Ponape-English and English-Ponape, with a Grammatical Sketch; by Rev. L. H. Gulick. [Ponape, also called Ascension Island, is one of the Caroline or West Micronesian Islands. Its population in 1856 was supposed to be about 5000, and is divided into five tribes: Metalanin, Kiti, Wanega, Nut, and Jekoij. The language is said to have decided affinities with those of islands to the west.]—Thirteen Inedited Letters from Sir William Jones to Mr. (afterwards Sir) Charles Wilkins; communicated by F. Hall.—Brief Grammar and Vocabulary of the Kurdish Language of the Hakari District; by the late Rev. S. A. Rhea. [Rhea arrived in Kurdistan as missionary in 1851, and established himself among the Nestorians of the Kurdish mountains at Memikan, a village of the mountain-plain of Gawar, where he remained till April 1859, when ill-health drove him home. On his return to the Nestorian country in October 1860, he remained at Orûmiah, where he died in September 1865. The dialect here treated is that of Hakari, or of the tribes which formed the late principality of Julemerk, the southern portion of the present pashalik of Van. The Kurds of this district may number about 200,000, and are divided into a variety of tribes. Besides, nearly all the Nestorians know the language. The Harput dialect being the western, and the Senna the south-eastern, that of Hakari is the central and probably the one least adulterated with foreign elements.]—Collation of a Second MS. of the *Atharva-veda Prâtihkhyâ*; by W. D. Whitney. [This important work was published by Professor Whitney in 1862, from a single somewhat defective and very incorrect MS. The new MS. now collated has recently been acquired for the Bombay Government by Dr. G. Bühler.]—On a Karen Inscription Plate; by Rev. A. Bunker. [The writer visited Karenee from Toungoo, accompanied by the Rev. J. B. Vinton, of the Rangoon mission, in 1868, especially for the purpose of seeing, and, if possible, copying, the famous plate. This feat they accomplished, though the plate was anxiously guarded by the chief, and even worshipped by the people. As they were not allowed to take wax impressions, they copied it each for himself. A lithographed copy is here given. The writer has not been able to decipher the inscription.]—The Pâli Language from a Burmese point of view; by Rev. F. Mason. [Endeavours to prove that, for a correct knowledge of Pâli and especially

the spelling of Pâli words, Burmese MSS. are no less, perhaps even more, valuable than Singalese. Though Pâli is studied by the scholars of Ceylon almost as their native tongue, still Ceylon has been dependent for the last two centuries on Burmah for the best Pâli MSS., as is proved by Ceylonese scholars themselves, and several important works which were not to be found in Ceylon have been rescued from Burmese MSS.]—Traces of Glacial Action on the Flank of Mount Lebanon; by Rev. W. M. Thomson.—On the Comparative Antiquity of the Sinaitic and Vatican MSS. of the Greek Bible; by E. Abbot (see *Academy*, vol. iii. p. 351).—Proceedings.

Zeitschrift der deutsch. morgenländ. Gesellschaft (vol. xxvi. Nos. 1 and 2).—The Assyrio-Babylonian Cuneiform Inscriptions; by E. Schrader. [Contains not only an elaborate summary and justification of the method and results of Assyriology, but a short grammar of the language.]—New Moabitish discoveries and enigmas; by K. Schlottmann. [A description of the curious clay-vessels, &c., said to have been found in Moab, on the authority of the sketches and copies of Herr Weser, pastor at Jerusalem, with discussion of the inscriptions. Schlottmann inclines to believe in their authenticity.]

Gött. gel. Anz., No. 33.—Enting's *Punic Stories*; rev. by Nöldeke. —No. 37.—Driver's edition of Ben Shêsheth on Jeremiah and Ezekiel; by H. E. —No. 40.—Transactions of the Society of Biblical Archaeology; by H. E. [Draws especial attention to the valuable papers of Dr. Birch on a hieroglyphic tablet of Alexander, son of Alexander the Great, and of Messrs. Lang and Smith on Cypriote inscriptions.]

Zeitschr. f. Völkerpsychologie und Sprachwissenschaft, vol. vii. No. 4.—Recent History of the Science of Language; by G. Lefmann. [I. Leibnitz. II. Dutch and German schools of philologists. III. The question of the origin of language.]—Syntactic Gleanings from the Classical Old Indian; by F. Misteli.—The Dual in Semitic; by Th. Nöldeke. [The Hebrew use of the dual, to denote things which go in pairs, more original than the Arabic.]—On *bona fides*, according to the Roman and Prussian law of land; by Baron.—Reviews: Gerber's *Die Sprache als Kunst*; by Tobler.—Lübbert's *Die Syntax von quom*; by Holzmänn. [The best part of the book, the examination of the temporal clauses in Plautus.]—Zschokke's *Arabic Grammar*; by Wetzstein. [A favourable review, with many facts of interest to the student of dialects.]—Brücke's *On the Physiological Basis of the Modern High-German Verse*; by Steinthal.—Steub's *Die oberdeutschen Familiennamen*; by Steinthal.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 59.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The Editor cannot reply to questions from authors respecting the notice of their books.*

*The next number will be published on Friday, November 15, and Advertisements should be sent in by November 11.*

## General Literature.

**Memoir of Count de Montalembert.** By Mrs. Oliphant. Two Volumes. Blackwood and Sons.

THE Romantic movement had many sides; but perhaps its permanent significance is best expressed by saying that it was the idealisation of the growing-pains of a single generation. The young men who entered life when the storms of the revolutionary wars were clearing away had some excuse for believing, what all young men wish to believe, that the tiresome routine of existence was come to an end at last, that, after the world had passed through such an astounding series of crises, it never could settle down into the old ruts again, and jog along at the old humdrum rate. As the appalling fact became plain that life was going to be much the same as it always had been, as they found the world was too heavy to be lifted up to ideal heights on their shoulders, they had really no alternative (unless they would submit to be commonplace themselves) except to cry for the moon and the middle ages. *Le mal de René* became a fashionable complaint for the same reasons that René had become a fashionable hero. Society was weaker than in the eighteenth century, when it was still strong enough to turn at least one cold shoulder to Rousseau, and it was only the weakness of a corrupt society that made it possible for Rousseau, with his diseased craving for emotions, to become a power at all. The society of the restoration was purer than the society of the *ancien régime*, but this was not enough to compensate for the strength of traditions still unbroken; and there was another source of weakness which perhaps has not been sufficiently noticed. Napoleon, with all his hatred of *idéologues*, had rendered them an inestimable service by organizing all the higher education of France upon an uniform, systematic, compendious plan. A person who has been through such a course of instruction feels that he has exhausted the world as it is when he is still upon the threshold of actual life. He has had a summary of everything, and has nothing to wait for before making up his mind whether he will despair of it all or undertake to regenerate it upon any principle which happens to commend itself to him. Montalembert elected to regenerate the world instead of despairing of it; he was free from the diseased personality which coloured the pessimism of Rousseau, and in a lesser degree of Chateaubriand and Lamartine. His career might be taken as a model of healthy romanticism, or, if healthy romanticism is a contradiction in terms, it must be admitted that he lived a life of wholesome and deserved prosperity, though he tried men and things by a standard which no generation could have attained, and though his own generation came short of any standard by which an honourable

VOL. III.—NO. 59.

man could consent to try his contemporaries or to be tried himself.

His early life was passed in England under the care of his maternal grandfather, who consoled his declining years by expanding his Oriental memoirs into many folio volumes for the future edification of the young Montalembert, who seems to have been a model boy of the Miss Edgeworth type, with a very exalted estimate of the value of knowledge and a strong desire to reward his elders for their benefits by deserving their approbation. He seems to have been less comfortable when reclaimed by his own father, who interrupted his studies to take him to all manner of sights and ceremonies, of which his precocious gravity exaggerated the inanity. At the age of twelve he made his brother, aged ten, swear everlasting fidelity to the charter of poor Louis XVIII.; one year later he gravely observed in his journal that the heroic fortitude of that monarch under his painful and lingering illness was worthy of the august author of the *Charte constitutionnelle*. At the Lycée of Sainte-Barbe, at the age of fifteen, he recorded his conviction, finally determined by the perusal of a work upon law, that England was the first country in the world; at seventeen, he and his friend, Cornudet, solemnly pledged themselves to one another to devote their lives thenceforward to God and their country. Montalembert was already exercised by the problem how he was to reconcile his ardent faith with his equally ardent patriotism. He left the *lycée* to his regret without a prize, apparently he had read too much and too widely to be able to produce anything empty enough to be finished. Immediately afterwards he had to join his father, who was ambassador in Sweden, and to enter into the gaieties, such as they were, of the society of Stockholm. His experience was not favourable. He concluded that society could only be amusing to those who were famous. A lady of his circle pronounced him *altier et pédant*, and it is probable that at least one-half the charge was not ill-founded. At this period he imagined that his serious mission in life, which these vexatious frivolities so unaccountably delayed, was to sit at the feet of O'Connell, the solitary Catholic patriot of the period, and write an immortal work upon Ireland. These plans were interrupted by the necessity of escorting his sister to a warmer climate, but to his great remorse she died upon the journey. On his return to Paris he published two articles on Sweden and Ireland; he seems never quite to have forgiven M. Guizot, then editor of the *Revue française*, for mutilating the former after he had consented to abridge it, though perhaps editors may sympathize with a *confrère* who shrank from publishing a sarcastic account of a king, by the son of an ambassador resident at his court.

Montalembert set off on the Irish expedition just in time to miss the fighting in July; he hurried back at once to serve his country; but his father felt that such enthusiasm was rather likely to compromise the family, and sent him back to complete his tour. He was enchanted with the Irish peasantry, and did poetical justice to the charms of Irish scenery; the only drawbacks to his enjoyment were that he could not settle which of Lord Donoughmore's daughters to fall in love with, and that he was disappointed in the Liberator, who, instead of fooling the young enthusiast to the top of his bent, turned him into a miscellaneous drawing-room to find his level and, as he naturally supposed, enjoy himself.

Mrs. Oliphant is probably right in supposing that in spite of this disenchantment the visit to Ireland determined Montalembert's career. The discovery that priests could act as demagogues among a fervently Catholic population seemed the entire solution of all difficulties as to how ardent Catholicism was to be reconciled with ardent patriotism. The solution might have been less satisfactory

if Montalembert had understood the harangues of the tribunes whom he venerated, and if his own patriotism had not been as aimless as it was ardent. He seems to have been sincerely under the impression that the principles of 1789 provided for all the legitimate needs of humanity, that the charter of 1814 was an adequate, though perhaps perfectible, embodiment of those principles (whence it followed that any infringement of the charter was to be regarded from a very transcendental point of view), that the consent of Parisian newspapers and *à fortiori* a successful insurrection in the streets of Paris were unmistakable declarations of the will of France, and that any government which a few resolute and dexterous men could manage to impose upon the insurgents was consecrated by the national choice. Perhaps one reason why parliamentary government has succeeded better in England than in France is that in England the series of fictions on which it reposes have been assumed without being stated, while in France those fictions have formed the favourite topics of parliamentary amplification and the favourite arena of parliamentary contests. Montalembert attempted to account for the difference in another way; he imagined that public men in France had only to imitate their neighbours and practise the parliamentary virtues for two or three centuries: and imagined that this would compensate in the long run for the disadvantage of France in not possessing a secure and respected aristocracy. The fact is that in England the majority of the people have never been in such a bad condition as the majority of the French before 1789: the material relief, with its legal conditions, which the people then gained partly through the fears of the government and the privileged classes and partly through their own violence was the one permanent result of the revolution. This is the reason why the majority of English electors are credulous and excitable and loyal, while the majority of French electors are jealous, sceptical, and apathetic, and the section which is not apathetic keeps the rest of society in a constant alarm by the irrepressible pretension to have the revolution established *en permanence* till it shall have accomplished as much for the floating population of the towns as for the settled population of the country. With the passions of this section Montalembert had not the slightest sympathy. He was quite sincere in his enthusiasm for liberty, partly because he liked to be left alone, partly because he had a haughty dislike for the seamy side of politics, for all the shabby and arbitrary things which it is necessary for a government to do that wishes to be strong in France, and, perhaps, in other countries. He was too generous not to exult in the abolition of all the tangible privileges which had once been so oppressively felt; but he was neither too logical nor too imaginative to be surprised that anybody should find it difficult to accept the social inequalities which were the effects of those privileges, and had simply survived their causes, as a natural, not to say a beneficent, arrangement. Liberty and liberalism are large words; and Montalembert was not alone in supposing that the particular side of a complex movement which aroused his individual enthusiasm was the side which ought to triumph; and that nothing but blindness and prejudice could keep intelligent contemporaries from seeing the necessity of recognising this side as a preliminary to successfully repressing or suppressing the rest. It may be doubted, indeed, though he loved both liberalism and Catholicism ardently, whether he loved either quite disinterestedly as an end in itself; whether both with him were not means and conditions of his ideal life. He was sufficiently attached to the liberty of the press to defend it when it menaced a dynasty, but he called for measures of repression when it had begun to threaten property. He desired

a liberty both of action and of teaching for the Catholic clergy which was utterly incompatible with the doctrinaire traditions of centralised administration; but he never seems to have realised that the triumph of Catholicism implies the suppression of liberty of opinion; he would sooner have seen other religions coexist for ever with his own than have exposed any respectable religionist to the slightest pressure of the secular arm. He never repented of the fundamental mistake of the *Avenir*, which was to suppose that Catholicism could ever unite itself to any system of temporal politics, and thereby give up the right of trading upon all in turn according to its own discretion and its own preferences.

When the *Avenir* was condemned, he submitted to the extent of believing, or at least of acting as if he believed, that its propaganda had been so rash as to be mischievous; but his personal attachment to Lamennais, which Lacordaire seems not to have shared, made it difficult for him to disentangle himself from the last struggles of that imperious thinker, who at bottom disliked Catholicism too much to accept it himself when he could no longer impose it upon others by his own dialectic. The years that followed this collapse were pleasantly and fruitfully occupied, partly by his marriage and settlement at La Roche-en-Brény, partly by some amusingly eager protests against the vandalism which was destroying the ancient monuments which the revolution had spared, and partly by the romantic *Histoire de Sainte-Élisabeth*. This last is delightful in its fresh picturesque fervour, and has none of the unsatisfactory compromises with commonsense which we find in the *Monks of the West*, where the writer seems afraid of hazarding his personal belief beyond the point up to which it is required in the interests of his narrative. It is unnecessary to add that even from the author's theological standpoint the *History of St. Elizabeth* is at least as uncritical as the old chronicles of which the headings of the chapters indicate an ineffectual ambition to assimilate the form. On his return to public life he distinguished himself by impressive and impassioned pleadings on behalf of Poland, the Sonderbund (whose untimely extinction he attributed to the intrigues of Lord Palmerston), and by a persistent and ingenious agitation against the monopoly of the university in the higher education. He was never able to convince the majority of his own supporters of the importance of his subject; and it may be doubted whether he did not fall to some extent into the mistake of confounding symptoms with causes. The teaching of religion at Oxford, forty years ago, was as perfunctory as it can have been in French *lycées*, but a young man's faith incurred no peril whatever by his passing through an university education, for the consent of educated opinion was still orthodox. Educated opinion in France has never really been reconverted since the days of Voltaire, himself a pupil of the Jesuits. Of course the claim to be educated outside the main current of educated opinion was perfectly legitimate, as such opinion did not claim to be infallible. Of course, also, the monopoly of the university helped to confine thought to a series of sterile oscillations between Condillac and Descartes. It is doubtful, however, whether much was really gained for Catholicism by disqualifying some hundreds or some thousands of young men for entering with sympathy into any profession but that of Papal Zouaves, or by passing as many Parisian *gamins* as possible through the hands of religious congregations, with no very perceptible effect in diminishing the ranks of the Commune.

After the revolution Montalembert occupied a position of considerable practical importance in the two reactionary assemblies which the peasantry sent up to punish Paris for

surprising them into a republic. He voted for all the repressive measures that were carried, and for some, like the proposal to establish a second chamber, which were not; towards the close of the republic he lost the confidence of his own party by showing a desire to conciliate rather than humiliate the doctrinaire section of the conservatives in the settlement of the education question. It is possible that M. Veuillot may have been wrong in his estimate of Montalembert's policy; but his polemical instinct did not betray him in his estimate of the temper of the fellow-labourer he disowned. Perhaps the irresponsible isolation into which Montalembert was thrown by the settlement of the question to which he had devoted himself may have had something to do with the naïve pertinacity with which he clung, even after the *coup d'état*, to the belief that the prince-president was the tool of the party of order, and had no desire to make the party of order his tool. When he was finally undeceived by the confiscation of the Orleans property, he naturally became the most bitter and disdainful of the anti-imperialists; and he had a magnificent opportunity of insulting the government in a dignified way when it made the mistake of prosecuting him for his exaggerated panegyric on our method of managing Indian affairs. After this he appeared twice in public: once as the advocate of Poland, and once at Malines to inculcate the fascinating and unmeaning formula of a "Free Church in a Free State." But the greater part of his later years were spent in carrying on his colossal work on Monasticism, amid increasing physical infirmities. The preparations for the Vatican Council alarmed and disgusted him as well as other Catholics, who had hoped too much from their schemes of reforming the world on Catholic principles, to be quite ready to sacrifice this world to the next; but it appears, from some naïve expressions in his last illness, which Mrs. Oliphant has recorded, that, when the definition came, he would have made the same half-submission as he did in the case of the *Avenir*, and with the same boyish good faith.

Mrs. Oliphant has been too anxious to explain her hero to exhibit him quite so fully as might be wished; we cannot help thinking that even at some expense to his dignity, in the earlier part of the life, he might have been allowed to speak more for himself, and regretting that the time has not yet come for biographers to speak of the idyll of his marriage. Still, with these drawbacks, she has given a fairly complete and highly interesting picture of a high-souled and accomplished gentleman, whose eloquence, earnestness, and unselfishness, gave him a much higher rank in his own country than they would have given him in ours, which he envied and admired so much.

G. A. SIMCOX.

**Wergeland's Selected Works.** [*Udvalgte Skrifter af Henrik Wergeland.* Udgivne af H. Lassen.] Copenhagen: Gad.

MR. LASSEN deserves the thanks of all Norwegian students for this convenient selection in one compact volume. Hitherto Wergeland has only been accessible in the great standard edition of his poetical and dramatic works, nine ponderous tomes, and his prose writings have never been collected at all. Of the present work the first 350 pages are occupied with the poet's best verses, and it is only with these that we care to deal. Wergeland's pamphlets and histories, novels and biographies, can scarcely be read out of Christiania. This man combined in himself the characteristics of a divine poet and a local stump orator, and his achievements in the latter line were apt to be deplorable.

The book begins with an ode, *Til Norges Frihed* ("To Norway's Freedom"), in very bad sapphics, published, when the writer was sixteen, in the omnivorous journal

*Morgenbladet*, now a most respectable and even venerable newspaper, but in those days, 1826, still very young and silly. "Norway's Freedom" itself was very young, and Christiania had not yet settled into a capital of Europe at all decidedly. "The wonder was not yet quite gone" from her so long provincial eyes, albeit her day had counted as ten years. It was so new, so strange to be the centre of an independent kingdom; who can doubt that Dublin would receive metropolitan honours with long-continuing agitation? and Christiania had been the Dublin of the Danish dominions. Everybody went mad over the new liberty, and the journalism of the first fifteen years of independence is quite a curiosity of literature. A new kind of poetry was invented to form a safety-valve for so much excitement, *Syttendemaipoesi*, or poetry for the 17th of May, the anniversary of the crowning of King Christian by the Storting, and Wergeland's ode is a beautiful specimen of this sort of composition. Hardly anything so tawdry, so wearisome, so unreal, has ever been foisted on human attention as the pamphlets and poems of Norwegian independence. A sketch of this literature would form a curious chapter for Dr. Forbes Winslow's celebrated work on the *Obscure Diseases of the Brain*.

Wergeland was an emanation from the very centre of this society. Born in 1808, he was six years old when his father went to Eidsvold to be a member of the infant Storting, and he must have fed upon brochures, as other baby-poets feed on fairy-tales and folk-songs. In him the *Syttendemaipoesi* culminated, and, before his death, decayed and disappeared. It is impossible to help thinking that Mr. Hartvig Lassen might have given us less of this rubbish; there are a great many verses in the earlier part of the volume that have nothing but their fine versification to put forward as a claim to immortality. The best of them are those which have reference to republican leaders and dogmas in foreign countries, to Liberty in England and France. Perhaps the very best is an ode, dated 1836, on the death of Rouget de l'Isle, who embraced the virginal muse but once, and begat a god. The sonorous march of the verse in this elegy is worthy of the men who went singing through the land that they might die for Liberty. But most of the political poems of Wergeland are turbid and shallow, and his ideas reach no farther than Rousseau; he wrote in 1840 like a Girondin of 1792; his whole life was an anachronism.

Wergeland was a much better poet than Southey; he was a much worse poet than Shelley, but he combined several characteristics of these two men. He surpassed the former in copiousness, if that be possible, and he had the same fondness for strange and unwieldy themes; he was consumed, too, with the desire of writing epics. On the Shelleyan side of his genius, he was a fantastic and original lyricist, republican, unpractical, unworldly, desirous of solving the world's enigma in choral dramas. He had the same love for ghastly objects, the same rather morbid fondness for the horrible, that Shelley had. There is a poem in this volume, *Pigen paa Anatomikammeret*, ("The Girl in the Dissecting-room"), that would have delighted the author of the last part of the *Sensitive Plant*. But Shelley in his happier moments was as ethereal, as white as the translucent air of morning, while Wergeland, even where he shows most power, is always lurid and distorted, and of the colour of a thunder-cloud. He is the most English of all Scandinavian poets; not only does he exhibit, in a hundred places, a fondness for English thoughts and habits that amounts to Anglomania, but his style and the character of his writing is more allied to our own than that of any other Northern poet. The Scandinavian scalds eschew metaphysics, but Wergeland

constantly weaves together profound thoughts in his own wild way; instead, too, of the limpid flow of fancy that the Norwegians are accustomed to, this poet festoons his poems with rich and redundant imagery, like an Italian or an Englishman of the more florid order.

When he was twenty-two, Wergeland wrote a drama that covered 700 pages with closely printed verse. This production he designed to be "an epic of the human race and a Bible to republicans." It takes the same place in his literary history that *Queen Mab* does in Shelley's. In a late work by the editor of this selection, *H. Wergeland og hans Samtid* ("Wergeland and his Contemporaries"), we have some curious letters and thoughts belonging to this period, that show how completely uncritical and unsound the author's views on poetry were. There must be something very wrong with a poet's mind when he writes an epic of the human race in 20,000 verses; and had not Wergeland by singular good-fortune met with a sharp and unshrinking volley of criticism, it seems very doubtful whether he would have left anything worth reading behind him. However, in his contemporary, the poet Welhaven, he met with an antagonistic critic, whose words were like rapier-thrusts, sharply dividing the good from the bad. The story of their long quarrel and controversy is among the most amusing episodes of Northern literary history, but it chiefly concerns us here to notice the beneficial effect on Wergeland of Welhaven's polished taste and artistic instinct. Conscious that his absurdities would be ridiculed, he set himself to be absurd no longer, and the last five years of his life (he died young, in 1845) are represented by noble works, full of power and melody, and displaying a greater reticence and a more chastened taste. Mr. Lassen has very wisely given his four greatest works in full, rightly considering that they are too excellent to be mutilated by selection. Two of these, *Jan van Huysum's Blomsterstykke* ("J. v. Huysum's Flower-piece") and *Svalen* ("The Swallow"), are lyrical romances, or rhapsodies, exquisite in fancy and sentiment and splendid in execution; another, *Jøden* ("The Jew"), is a protest, nobly worded, against the expulsion of the Jews from Norway, a remnant of barbarism since exploded; the last, *Den engelske Lods* ("The English Pilot"), is the latest and most finished of his writings, and, though surpassed, perhaps, in parts by the magnificent strophes of *Svalen*, is, on the whole, the finest work he left behind him.

*Den engelske Lods* begins with a description of the longing after land, the straining of the eyes that watch the horizon towards the end of a long voyage. The poem is written in short, irregularly rhyming trochees, with songs here and there. Presently the white cliffs of Dover glimmer on the horizon, and the sailors join in a Wergelandesque song to England, as the home of freedom:—

"What a glory  
For a man  
Here to live and love and labour!  
What a glory  
To live safe  
In the old oak's shelter!"

We are then taken along the southern coast of our island; everything is minutely and vividly described, scenery and inhabitants, ships and towns, till we reach Portsmouth, where the pilot is introduced. He is the hero of the poem, and in the eighth canto he begins to tell his story, and in the end comes with the whole party back to Norway, to settle there with his old love, Mary Ann. The last two cantos, describing the scenery and life in Hardanger, where they come to live, have especial beauty and tenderness.

A strange quiet gathers round the record of a very stormy life. Remembering how completely his many-sided public

reputation has all slipped from him since his death, leaving him only a poet, into what a silentness all the thundering noises that sounded in his ears have fallen, how different the Christiania of to-day is from the city as he knew it, one recalls his own words sung over the grave of the poet Bjerregaard (I am forced to sacrifice rhyme in translation that I may preserve the order of the words and rhythm):—

"Bring your laurel-garlands here,  
Now the poet's brows are heavy,  
Cold and white!  
Golden rain from leaves of laurel  
Now no more can drop down poison!  
On his grave  
Pour them, till its sombre edges  
Vanish, hidden by green leaves."

The versification of Wergeland is original and happy. He especially delighted in adapting his thought to the measure of old songs. It is strange that our poets have not availed themselves of the metrical discoveries of the Scandinavians. Mr. O'Shaughnessy seems to have borrowed something of the liquid numbers of the Swedes, but no other recognised English writer has availed himself of these, or of the bolder Danish metres. EDMUND W. GOSSE.

**Septimius: a Romance of Immortality.** By Nathaniel Hawthorne.  
Henry King and Co.

A POSTHUMOUS publication is always a trial to the reputation of the author concerned, and it might have been thought that the polish and elaboration of Hawthorne's style would make the ordeal peculiarly severe. But, on the other hand, the weirdly paradoxical effects at which he aimed may sometimes be almost as successfully produced by an unfinished outline, in which the salient points are hinted at and the rest left to imagination, as in a picture with every detail complete, so that it is impossible to ignore the incongruities which make, and yet are always on the point of marring, the fascination of the whole. Of all Hawthorne's works, *Septimius* has most in common with his greatest, *Transformation*. The common realities of earth are made to mingle, in about the same proportion, with the story of a spiritual life, passed partly under altogether unearthly conditions. The actual is not opposed to the ideal, for Hawthorne, with true artistic reticence, never set his characters to carry out his own schemes of excellence; and this was fortunate, for, after all, his ideas were commonplace and circumscribed within the limits common to well-intentioned citizens of his age and country. It is opposed to, or rather artfully intermingled with, the imaginary: a world of visions of what might have been, of things morally possible though physically untrue. He persuades us to half believe the wonders he half asserts, because he never tires our credulity nor exhausts his own credit by an unnecessary demand or a quite unqualified fiction. After his wildest flights of fancy a sudden touch of realism will bring us down to modern American earth, and by these intermittent glimpses of the soberest sanity, he tempts us to reflect for a moment seriously whether perhaps there may not be some sense, spiritual or material, in which his legends may be understood to convey a truth. And this is all the triumph he aims at, for a brief shock to the normal scepticism of his intelligent contemporaries bears stronger testimony to the power of his imagination than the blind inconvenient faith of an enthusiastic mystic, who after accepting everything would wish to know what next. It is his want of purpose that constitutes Hawthorne's great superiority to the fantastic romance of Germany and to the romantic illuminism which at one time spread also into France and England, in which the mysteriousness was of incident, not of character, and

was always more or less explained away at last by a system of trap-doors and secret societies.

In *Transformation* the author's work seemed to be half done for him by the atmosphere of Rome, laden, in historical truth, with the inherited conflicting mysteries of innumerable ages. In *Septimius* there is no such accidental help, in fact the age and country in which Hawthorne has placed his hero seem chosen on purpose to bring the unreality of his quest into the stronger relief. A New England youth during the War of Independence slays a British officer of his own age, and remote common descent, from whom he receives an obscure ancient recipe for preparing the elixir of life; there is Indian blood in his veins, and he has already heard of the legend of an Indian ancestor of his who possessed such a secret; also, like other unpractical dreamers, who, because they do not know how to extract from life the pleasures it is said to afford, blame life rather than their own dull or misdirected senses, Septimius crowns his unreasoning complaints by settling that only the shortness of life is in fault, not its emptiness. The pursuit in which he sacrifices happiness and almost life is described with Hawthorne's usual skill, and it may be that he refrained from using the obvious mediaeval *cadre* because he distrusted his power of giving it all the reality necessary for the kind of illusion he desired. The only other reason for the choice is that it is part of the plot for Septimius to kill his relation, in all innocence, as a preliminary to profiting by his bequest, and that this can best be managed by a war between different branches of the same race. In the first half of the romance as it now stands, Septimius is the lover of a good and pretty girl, from whom he is gradually withdrawn by his absorbing pursuit and its chilling, hardening effect on his character; in the second half Rose is turned into his sister, and is peaceably betrothed to Robert Hagburn, the Werner of the tale, a rustic who volunteers for the war like a man, and, according to the first scheme, was the rival who would have consoled Rose for Septimius' infidelity. It is not clear what substitute could have been made for the passages where Septimius is gradually alienated from his betrothed, but the character of Sybil Dacy, which was evidently meant to be second in importance to that of Septimius, is very imperfectly worked out, and the author may have intended to transfer the account of his struggles between love and a diseased ambition to the earlier part of his intercourse with and passion for Sybil. We are not sure that anything is really lost by the story being thus cut into two halves which do not fit on to each other exactly, for each half is evidently written so as to do most justice to its leading motive, and something would have had to be sacrificed before complete structural unity could be attained. Besides this, Sybil is almost too artificial to be interesting; Septimius is at least half real, but she is invented for the plot's sake, and the features which are indicated in the work as we have it suggest that the author might not have avoided the danger of mannerism in completing them. On the other hand, the memoranda of ideas and fancies to be worked out, which are very rightly reproduced in the printed edition, seem to show that Hawthorne meant to develop in detail some of the more perplexing experiences to which a modern wandering Jew might be exposed, such as the natural antagonism between the mortal and the immortal, and the tediousness of infinite leisure, which proposes to spend a century upon every experiment of a new mode of life; there was to be a long conversation between Sybil and Septimius on this subject before they drank the magic draught which, the latter fancied, would make them immortal together. Septimius hesitatingly suggests after a good many philanthropic and ambitious schemes that for one hundred years he would try

what being wicked was like, and his embarrassment when Sybil unhesitatingly replies, "And I too," is humorously conceived. The catastrophe is more effective as a situation than the end of *Transformation*, but the melodramatic element in it rather interferes with the tranquil manifestation of the spiritual truths of the conclusion. The material future of Miriam and Donatello is scarcely indicated, but we know that as long as they lived their penance must have been tempered by the consciousness of a union of soul the more perfect in proportion as it was dearly bought. Sybil, on the contrary, has to be violently removed from the scene on which she only appeared to execute a mysterious vengeance, and Septimius, we feel, is disappointed rather than disillusioned. The elixir of life is left to rank as an unattainable possibility, and though this is just how Hawthorne wishes to persuade his readers to regard it—for an hour or two—it does not seem fitting that an actor in the romance should be brought to exactly the same standing-point as the spectators. On the whole, in *Septimius* Hawthorne is sometimes at his best, and never betrays anything that can be confidently taken for a sign of failing powers, and for this reason it is doubly welcome to us; it is pleasant that the last words of a writer whom it is impossible not to esteem, and easy to admire, should be worthy of himself, and the Note-books and Journals which were so abundantly bestowed upon the public were distinctly not worthy. They seemed to represent the childish docility of the man of original invention and creative fancy in the passive hours when he was living for himself, not for the world, and having brought back from the land of dreams no prejudices in favour of one way of living rather than another, he tried with good-natured indolence to live the life and think the thoughts of the many. Or, perhaps, a better explanation of how he could write so like a schoolboy, about scenes and paintings from which his fancy is proved to have derived much wholesome nourishment, is to be found in the peculiarity of his intellect, which was powerful and ingenious enough while only applied to objects of his own invention, but had so little sympathy with unadulterated reality that its judgments had to be either conventional or false; and of the two alternatives his modesty preferred the first.

H. LAWRENNY.

#### LITERARY NOTES.

"An Admirer of Keats" writes to the *Athenaeum* to give a version of his sonnet "To Sleep," which differs considerably from the one published by Lord Houghton in his *Life and Letters*. It is apparently a first draft, and was found written in the margin of a copy of Milton which had been lent to the poet. After the third line it continues, instead of "Enshaded in forgetfulness divine"—

"As wearisome as darkness is divine;  
O soothest Sleep! if so it please thee, close  
Mine willing eyes in midst of this thine hymn,  
Or wait the amen, ere thy poppy throws  
Its sweet-dart-dews o'er every pulse and limb;  
Then shut the hushed casket of my soul,  
And turn the key round in the oiled wards,  
And let it rest until the morn."

The next line contains various corrections, and the end of the sonnet is wanting. The writer also quotes a few of Keats' prose annotations in the same volume, which was in the possession of the late Mr. Dilke: they are different in some respects from those reprinted by Lord Houghton from the *American Dial*.

A new book by David Strauss is announced, *The Old and the New Faith: a Confession*. It is in four sections, headed—I. Are we still Christians? II. Have we any Religion? III. How do we conceive the World? IV. How do we direct our lives? Two supplements, "Concerning our Great Poets," and "Con-

cerning our Great Musicians," would seem to contain the gleanings of the author's critical commonplace books.

The Royal Bavarian Academy of Sciences has just received the report of the Historical Commission on its thirteenth general meeting; most of the works announced are in continuation of previous undertakings, but it is said that the *Universal German Biography*, begun at Ranke's suggestion, will have one volume, containing the letter A, ready for publication by the new year. More than 200 contributors, including all the principal German historians, are mentioned as interested in the work.

*Le Royaume d'Yvetot*, which in most people's minds stands on a level with *le pays de Cocagne*, has just received the honours of an historical monograph. The rights and privileges of the king of Yvetot were quite real. Louis XI. and Henri IV. treated the miniature sovereigns with respect, and though a legend which dates the independence of the fief from Clovis is untrustworthy, a *roi d'Yvetot* seems to have reigned as early as the twelfth century. The kingdom was sold—like the Roman empire or the principality of Monaco—in the fifteenth century, and fetched 1400 gold crowns.

Mr. Fr. Frommann, of Jena, has in the press another Greek comedy by Professor Julius Richter, called *Chelidones* ("The Swallows"), in which, with Aristophanic humour, he characterises the Ultramontanes and Communists as bad citizens of one and the same species.

M. Luzel has just published, in a pamphlet form (*De l'Authenticité des Chants du Barzaz-Breiz de M. de la Villemarqué*; Paris: Franck), the lecture he delivered at Saint-Brieuc, last July (cf. *Academy*, vol. iii. p. 260, where, by the bye, the name of M. Mowat has been misprinted Morvat). His subject was the authenticity, or rather the want of authenticity, of the would-be popular Breton ballads published by M. de la Villemarqué under the name of *Barzaz-Breiz* (lit. "The Bardism of Brittany"). M. de la Villemarqué had given his name to deliver a lecture at the "Congrès" on some archaeological question, but when he heard of the intended lecture of M. Luzel, he deliberately declined to go. No objections were made to M. Luzel when he had done reading; but friends of M. de la Villemarqué were not ashamed to ask that, contrary to the custom, no mention would be made of M. Luzel's lecture in the *procès-verbaux* of the day; such exception, said they, was made necessary by the personal question introduced into the debate. And M. de la Villemarqué had been purposely absent! That suggestion, however, was objected to by eminent members of the "Congrès," amongst whom was one of the patrons of Breton literature, the worthy bishop of Saint-Brieuc, Mgr. David. Such impediments in the research of historical truth make M. Luzel's merits greater. The question treated by him had already been the subject of several articles, here and there, by M. d'Arbois de Jubainville, by M. Liebrecht, by M. Le Men, and by M. Luzel himself, and had ceased to raise doubts in the minds of scholars; but the matter is altogether settled by this last pamphlet of M. Luzel, the candid and careful collector of Breton lays, legends, and tales, who has a special competence in the question. It is to be regretted that M. de la Villemarqué so obstinately gives, as actually sung by the people, ballads which are either arranged and embellished or altogether forged. Would he candidly confess that, when he published his *Barzaz-Breiz* for the first time (nearly forty years ago), criticism was not very strict with editors of popular poetry, and that he thought himself permitted, by the example of Walter Scott and others, to arrange popular materials, or even to make fictitious ballads, every one would readily forgive him that, and remember only the real services he has conferred on Breton literature by his various publications. But by unwisely pleading "not guilty," when the evidence brought against him is so strong, he has succeeded only in making his case worse.

Théophile Gautier, the patriarch of the second generation of Romanticists, died at Paris on Wednesday, the 23rd ult. We hope to speak more fully of the place he filled and the blank he leaves in an early number.

## The Drama and Art.

### PARISIAN THEATRES.

MOST of the theatres are now open for the winter season: and some have already mounted new pieces. At the Français *Le Cid* of Corneille is being given, in order to enable M. Mounet-Sully to appear in the part of Rodrigue. The play is performed, almost for the first time, as Corneille wrote it, without the usual omission of the part of the Infanta. Appropriate scenery and dresses have been provided, so that the masterpiece of the older drama is presented to the public with due magnificence and care. But the actors? Let us take Mounet-Sully first. The part of Rodrigue is a very arduous one for any actor, and for a novice in his art almost impossible. It is all in one key. Called upon by his own father, Don Diègue, to avenge an insult inflicted on him by Chimène's father, Don Gormas, he has to choose at once between his father and his mistress. It is the old conflict of love and duty. He kills Don Gormas, and for the rest of the piece has to deplore his sufferings from the implacable enmity of Chimène. This series of lamentations is interrupted only by one splendid burst of eloquence—the speech in which he recounts the surprise and defeat of the Moorish army in a night-attack on Seville. The first qualities Rodrigue should possess are dignity and repose. It can scarcely be said that Mounet-Sully possesses either. He is violent and passionate: his gestures are extravagant, and want variety. There is no light and shade in his performance. He chants the verses in one key, as if they were the utterances of another person, and not the expression of his own thoughts and feelings. He is at his best in the delivery of the stanzas at the end of the first act, when he determines to challenge Don Gormas: but his whole conception of the part is so uncertain and inartistic as to destroy almost entirely that hope of future excellence to which his Orestes in *Andromaque* had given rise. On the other hand, nothing could be better than the Don Diègue of Maubant. His distress when his sword falls from his enfeebled hand, his passionate appeal to his son, "Rodrigue, as-tu du cœur?" and his pride in his success, are alike admirable. Mlle Rousseil, too, did her best with the thankless part of Chimène; and certainly delivered the famous line, when she appeals to Rodrigue to defeat her champion,

"Sors vainqueur d'un combat dont Chimène est le prix,"

with a passionate intensity that went to the heart of the audience. The rest of the actors speak the lines allotted to them with correctness and propriety. They have nothing else to do.

A new piece has been brought out at this theatre under the title of *Les Enfants*, by M. George Richard. It might be called in English, "What's to be done with the Children?" and deals with the oft-debated question of the position of those young people whose parents have declined to submit to the ceremony of marriage. But though, as I heard one gentleman say to another after the piece was over, "C'est une belle thèse"; M. Richard has done little towards the solution of the problem he proposes. The play is admirably acted, but is too slight to have a long existence. The best thing in it is a wonderfully graceful game of romps between the two children, impersonated by M. Boucher and Mlle Reichenberg.

At the Vaudeville, *L'Arlesienne*, by Alphonse Daudet, has not met with the success that was expected. The author is a man of letters and a poet, but has never been successful as a dramatist. His present play is a prose idyll rather than a drama; and taken as such is extremely beautiful. Each act shows a true picture of peasant life in Provence, made more exquisitely real by lovely scenery: but despite these attractions, and the simple poetic language, and the magnificent impersonation of a mother by Mlle Fargueil, the fatal defect of want of action wears the audience and ruins the piece.

The Odéon has reopened with a so-called "comedy" by Édouard Plouvier, a writer of great repute, to which he has given the odd title *La Salamandre*. It deals with the fortunes of a young lady, who, placed by no fault of her own in a position that compromises her, comes out of the ordeal with unblemished reputation. The idea is ingenious, and might possibly, in abler hands, have been made the groundwork of a really fine play: but, as it stands, the great situation is repulsive, and the characters, when not contemptibly weak, are odiously disagreeable.

The Châtelet has just reproduced *Patrie*, with a very good cast and splendid appointments.—The Ambigu is about to play a new drama, *Le Centenaire*, with the veteran Lafont in the principal part.—The Gymnase has reproduced that evergreen *Le Fils de Famille*, surely as graceful a piece of witty and harmless badinage as was ever played on any stage. How charming, too, is the music! and how delightful nowadays to have the opportunity of enjoying a piece in which the songs form a part of the dialogue, instead of a tiresome interruption to it. London playgoers may recollect it years ago, under the title of *The Lancers*; or, *The Gentleman's Son*.

The Français—after certain *reprises* of well-known plays—proposes to bring out the *Helène* of Pailleron, author of *Les Faux Ménages*. After this *Marion Delorme* is promised, with Mounet-Sully as Didier: an announcement that would be rather depressing, were it not that an antidote is provided in the fact that all the best actors will appear in the other parts.

J. W. CLARK.

### ART NOTES.

English art has had a heavy loss in the death of Mr. George Mason, Associate of the Royal Academy. Mr. Mason's health had for years been such as to cause anxious apprehension to his friends; he suffered very severely in the course of last winter, and has died on the approach of this (October 22, *act.* 54). Since Gainsborough there has not been a more poetical and refined painter of English landscape and country figures than Mr. Mason. His place among contemporaries was rather by the side of the French pastoral painters, M. F. J. Millet or M. Jules Breton, than by that of any of his fellow-countrymen. A singular elevation and harmony, a singular and pathetic sweetness of feeling, have given to all his later work a charm and dignity which are very rare in the English painting of the hour. Mr. Mason's instincts were equally fine and true in colour and design; although, in both, his work might occasionally show a little of the hesitation and incompleteness of amateurship—for it was late in life that he began the professional practice of art—as well as of ill health. Mr. Mason was resident in Italy from 1844 to 1858, and a few of his pictures represent Italian scenes. But the great bulk of his contributions to the Royal Academy, for the last dozen years, have been small compositions of English midland landscape with village figures and field labour, in quiet colour and of an exquisite grace and tenderness. There are only three of his pictures, the "Evening Hymn," the "Girls Dancing," and the "Harvest Moon," of this year, which his physical powers enabled him to complete on a scale sufficient to do full justice to his original, harmonious, and delightful genius. (For some more particular observations, see *Portfolio*, August, 1871; *Athenæum*, October 26, and *Pall Mall Gazette*, October 28, 1872.)

In addressing the Cortes concerning the fire which took place at the Escorial on the night of October 1, the minister of finance, Ruiz Gomez, said, "Not a book has been burnt, nor a paper lost. It is a question of time and money, that is all." The area burnt is large, including the whole of the upper floors of the Colegio and the two towers known as the Colegio Tower and the Tower of Lucerne. The *Times* correspondent, writing on October 7, gives a vivid description of the ravages of the fire, but confirms substantially the reassuring words of the minister; he differs from him, indeed, as to the amount of damage done to the edifice, which he estimates as likely to come to twice the amount (40,000*l.*) officially stated as the probable cost of reparation. Besides the Hebrew and Arabic MSS., of which catalogues exist, and other valuable MSS. and books, amounting in all to 14,661, the library contained original sketch-books by Michel Angelo, Raphael, Titian, Albrecht Dürer, and other great masters. Great fears were entertained for the ceiling, which is one of the most magnificent pieces of decorative work in the whole building, but the rubbish which had fallen on it from the floors consumed above having been carefully removed, it has been found to have sustained none but trifling and easily reparable injuries. The heroic exertions of the inhabitants, and the fact that the architect of the enormous pile employed no wood in its construction where he could possibly use stone, prevented the conflagration from

spreading to the palace or church, and confined its ravages entirely to the Colegio end.

Fresh fruits are reported from various excavations on the classical sites of Asia Minor. Mr. Wood has just discovered several more fragments of sculpture in relief at the temple of Diana of Ephesus. Of these he writes that the most remarkable is a portion of the same frieze in vigorous projection of which a corner-piece, representing an Amazonomachia, is set up (labelled "Pilaster?") in the Mausoleum room at the British Museum.—The undertaking of Dr. Henry Schliemann is a less known and even a more colossal one than that of Mr. Wood (see *Academy*, vol. iii. pp. 26, 68). Dr. Schliemann is an archaeologist entertaining some eccentric views, but deserving the utmost credit for the zeal which has led him to spend time and fortune in searching for the ruins of ancient Troy. It would seem that Dr. Schliemann has really hit upon the Lysimachian temple of Athene at Ilium Novum. He has courteously promised to the British Museum the cast of a sculptured metope, complete between two triglyphs, from this building. This, judging by the photograph, must be a fragment of a very high value indeed. It represents Helios (with the radiating crown as on the coins of Rhodes) driving a *quadriga*, and is in the highest finish. The horses are extremely vigorous in design and action, and the flying draperies of the figure have a remarkable resemblance to those of the well-known "Niobid" of the Chiaramonti gallery in the Vatican. Generally it is an animated and picturesque style, recalling that of other sculptures belonging to the end of the fourth century B.C. Dr. Schliemann announces the publication of the fragment, together with an inscription found on the same site, in the Berlin *Archæologische Zeitung*.—In addition to these discoveries, Dr. Schliemann, clearing the circumjacent ground to the depth of 50 feet, with a gang of workmen 150 strong, has disclosed a prodigious structure of masonry sloping at an angle of 30°, which he would have to be part of the substructure of the Trojan Palladium itself. But the publication of Dr. Schliemann's projected *Prachtwerk* on Troy must be awaited before any exact judgment can be formed as to these latter discoveries.

The commission named, half by the Italian government and half by the municipality of Florence, for the conservation of the "David" of Michel Angelo has determined on the plan to be recommended. A pavilion is to be erected in the Academy of Arts to receive the colossus at the cost of about 72,000 lire; the cost of transport is reckoned at about 20,000 lire, and the removal is to be accomplished by means of an ingenious invention of Signor Francisco Porra.

We learn from Paris that the cabinet of medals and antiques in the National Library was reopened to the public on October 1. Monday, Wednesday, and Friday are to be held sacred to students; Saturday is reserved for the work of the catalogue, and Tuesday remains for visitors. The new gallery of sculpture which is being arranged in the Louvre, between the pavilions Mollien and Daru, is to receive the statues from the various imperial châteaux, and those already in the Louvre which have been judged the most important. At the end of the gallery is to stand the statue by Michel Angelo, which has remained for years forgotten at Chenonceaux. This new gallery is to be called the *Salle Michel-Ange*, and will be opened to the public as soon as the decorative paintings which ornament it are finished. This work has been entrusted to M. Birouin.

In the course of the present year the South Kensington Museum has restored to the people of Bayeux the morsel missing from the celebrated tapestry preserved in that town. The thief was no other than the wife of Stothard the artist, who went to Bayeux in 1830 in order to execute his well-known copy of the work in question. Mrs. Stothard profited by the courteous facilities granted to her husband for the purposes of his painting to cut with her scissors a piece about as big as a hand from one of the sides of the embroidered cloth. At the death of Mrs. Stothard, some years back, the museum of South Kensington became possessed of the stolen piece, together with an account written by Mr. Stothard, of the circumstances under which his wife committed the disgraceful theft. The directors of the South

Kensington Museum, when sending over this summer some artists to photograph the tapestry, announced their coming in a letter containing the relic, which has been gratefully received, and found to agree thread for thread with the original.

The *Nordische Presse* reports with reservations a rumour current to the effect that amongst the art treasures at St. Petersburg, purchased by the empress Catherine II., a piece of sculpture from the hand of Raphael has been recently discovered. The subject is a Child resting on a Dolphin. The same authority adds that the original of this work was known to exist in Paris up to 1770, and that there are many reproductions of the design both in plaster and engraved. The rumour is perfectly correct. This group, attributed to Raphael both by Förster and Passavant, has been recently exhibited to the public in the Hermitage palace. It was acquired by M. de Berteuil in Rome in 1768, and afterwards lost sight of. M. Guédéonoff, the active director for the Fine Arts at St. Petersburg, has found in an inventory of the time of Catherine II. proofs of the acquisition of the group.

A magnificent collection of etchings by Dutch painters was sold by auction, on the 5th of October, by Lepke, at Berlin. They were brought together by Baron Heinrich von Mecklenburg, who died in 1862. The catalogue was written by Herr Amsler, and it is hardly possible to cite any examples, as, out of the entire number, not one middling impression was to be found.—On the 14th of October, Boerner brought to the hammer at Leipzig the collection of Ferdinand Kern, the fruit of sixty-six years of diligent search. The principal gems were the numerous and rare engravings by Italian masters of the sixteenth century.—But on the 24th of October, a collection, surpassing, perhaps, in peculiar interest, either of the two above mentioned, was sold at Munich, viz. the very remarkable collection of the works of the so-called *petits maîtres* and goldsmiths which belonged to Dr. Posonyi, of Vienna.

The death of Count Schlieck took place recently at Paris, where he had resided for some time past. He enjoyed a great reputation especially in the Northern courts of Europe, acquired by his designs for sumptuous articles of plate, and his general elegance of taste in ornamental design. He lived at one time in Pompeii directing excavations, making casts from objects found, and copies from the frescoes in tempera. He has been lately engaged in the arrangement of his collections, which were very considerable, intending to sell them *en masse*. It is said that he leaves no heirs, and in that case the whole of his art-treasures will go to the state of Denmark, of which he was a native.

In the *Times* of October 9, Mr. Stuart A. Moore draws attention to the fact that exact calculations based on the entries of the Fabric Rolls of Exeter Cathedral (made in the year 1317-18, when the Lady Chapel appears to have been re-decorated and the four side windows glazed) show that even in the Lady Chapel, where glass is generally supposed to be the richest, the proportion of coloured to white glass was only a little over one-fourth. Thus, he says, in no case did the glass resemble the gorgeously stained abominations of the modern school.

Herr Jordan gives in *Im Neuen Reich* a particular account of the statue to Lionardo da Vinci which was unveiled at Milan on September 4. Signor Pietro Magni is the sculptor, and in spite of certain grave defects, Herr Jordan pronounces that he has on the whole achieved a work of distinguished monumental character. The figure stands sunk in meditation, and is very simply treated; at the corners are placed statues of his principal scholars, Cesare da Sesto, Marco d' Oggiono, Beltraffio, and Andrea Solario. These figures are well worked out; a little stiff indeed, but the serious matter is that they do not incorporate well with the whole. The high octagonal pedestal is very well designed. The loan exhibition in the Brera afforded a rare and magnificent opportunity of seeing the works of the great master; something like three hundred paintings by his hand had been collected from the palaces of the nobles in which they are usually hidden from public gaze. As to the modern paintings, Herr Jordan remarks the triumph of "fare da se," but confesses that as to technic it had not yet come to the shamelessness of Paris. He concludes his paper by drawing attention

to the desirability of at once printing and so securing to posterity the wealth of MSS. which Lionardo left behind him. The principal part of the treasure was removed in 1796 from the Brera to Paris, and with the exception of a stray paper or two the commissaries of 1815 left it undisturbed. A few papers are in England. Herr Jordan proposes that a society should be formed for the publication of the whole.

### Physical Science.

**The Beginnings of Life.** By H. Charlton Bastian, M.A., M.D., F.R.S. Macmillan and Co.

THIS book of Dr. Bastian's may be regarded as representing the final result of his long series of experiments and observations which have already partly been published in his well-known papers in *Nature* and in his smaller work on the *Origin of Lowest Organisms*.

The present work is divided into three parts: I. The Nature and Source of the Vital Forces and of Organizable Matter; II. Archebiosis; III. Heterogenesis.

Part I. is intended, according to the preface, "to show the general reader more especially that the logical consequences of the now commonly accepted doctrines concerning conservation of energy and the correlation of the vital and physical forces are wholly favourable to the possibility of the independent origin of living matter." That the evolution of organic matter by the action of physical forces took place in the remote past follows of necessity from the general hypothesis of evolution, but Dr. Bastian fails to see how it can be that this evolution of organic matter, having once taken place, should not constantly have recurred and indeed be continually occurring at the present time. But that such an opinion may logically be maintained by those who hold the theory of evolution will be seen from the following considerations.

Complex organic compounds are formed by the chemist in the laboratory by a gradual process. Thus by exposing certain inorganic substances to suitable conditions, a comparatively simple organic body, A, is obtained; A exposed to different conditions yields a more complex body, B; B yields C, and so on. Now this is the only method, as far as is known, by which complex organic bodies are formed apart from the influence of living matter, and thus it is conceived that the original evolution of organic matter took place in a like manner by a series of steps. The chemist has not nearly attained to the formation of bodies so complex as the protein-compounds which are the invariable concomitants of the exhibition of the phenomena of life, but it may well be concluded that, if ever the synthesis of such bodies

be attained, it will be by a long series of steps, say A-Z. As the organic bodies forming the successive steps are more or less unstable, it is necessary that the conditions requisite to raise each body one step should occur before disturbing influences, which would change the constitution of that body, have come into operation. Thus, in nature, compounds A, B, C might often be formed without leading at all to the formation of Z. Further, at the remote period in the earth's history at which the evolution in question is supposed to have taken place, the conditions of atmosphere, temperature, &c. were very different from what they now are. So that it would appear that, if it be admitted that the evolution of organic matter must necessarily be a gradual process such as that described, it may quite logically be held that the process, having occurred once, is not likely ever to recur, and the case is paralleled by that of certain minerals which are extremely local in their occurrence, and the conditions for the formation of which must have been brought together on very rare occasions. The Latin language was formed by a process of evolution, but it is almost inconceivable that the complex conditions requisite for its production should recur. At all events, the hypothesis that organic matter was thus evolved by a series of gradations brought about by a succession of complex conditions is in accordance with known chemical processes, and is therefore an explanation of the phenomenon; whilst the rapid formation of such matter in saline solutions which Dr. Bastian's experiments would seem to show is entirely unparalleled in the laboratory.

Another argument in favour of an *à priori* probability of the occurrence of the formation of living things at the present time brought forward by Dr. Bastian is that, unless this is the case, it is impossible to account for the present existence of such low organisms as the Monera, which are mere (and apparently homogeneous) masses of protoplasm, since these bodies must necessarily have become modified and have reached a higher state of organization during the lapse of ages. Professor Haeckel (*Biologische Studien*, p. 182) lays considerable stress on this point, and concludes that the moneron Bathybius at least is constantly coming into being *de novo* at the present day. Surely, however, Bathybius, inhabiting as it does the bottom of the deepest oceans, must exist under circumstances almost invariable, and, in the absence of any inherent tendency to take on a higher form, which tendency the evolution theory cannot admit, but which Dr. Bastian, in order to account for his results, is obliged to postulate, may have so existed from the very earliest times. From time to time some portion of the region inhabited by this Moneron may have been elevated, and being thus brought under the influence of varying conditions in shallow water, Bathybius may have become differentiated on the confines of the area occupied by it, may have formed a constant source of the Monera of sea-shores and fresh water, whilst the main bulk of its simple protoplasm may have always occupied the deepest seas and there reproduced itself unchanged. Surely this may well be considered a possible case of survival, and is no more difficult to explain than, *e.g.*, the survival of savages at the present day.

The latter portion of part i. is occupied by some account of the nature of low organisms. Amongst these are described Professor Haeckel's Monera, which, as before explained, are mere minute masses of structureless protoplasm, the lowest of them having no definite form at any period of its existence, but one which is constantly undergoing change. Now it is bodies such as these which, according to Professor Haeckel and Mr. Herbert Spencer, must have been originally evolved from inorganic matter, and have been the source of all higher organisms, and their forms

are such as protein-compounds may readily be conceived to have taken under the action of their known physical properties and the influence of immediate surrounding conditions. Hence the discovery of the Monera was regarded as of the utmost importance to the evolutionary theory as supplying a lost link between the lowest organic beings until then known and matter not living, and it was considered that, if by experimental means the evolution of living from not living matters could be brought about, the first form which they would be expected to assume would resemble that of the simplest Moneron. The living things obtained, however, by Dr. Bastian in his experiments are not found to have the indefinite form of the Moneron, but are bodies which have very definite shapes, in many cases obviously adapted to their special mode of existence or progression, and more or less heterogeneity of structure, some of them very considerable heterogeneity. The forms are Bacteria, Vibriones, Torulae, Moulds, &c.

Part ii. contains the pith of the evidence derived from observation and experiment which Dr. Bastian has to offer in favour of archebiosis, as he terms the origin of life *de novo*. The observations consist in the investigation with a high power of the microscope of the visible changes which take place in solutions in which the development of living things is proceeding. There seems very little doubt that Bacteria develop in solutions in which no particles whatever can be observed with the microscope. This is Professor Burdon Sanderson's conclusion, and according to his observations these bodies first make their appearance as indefinitely minute spheroidal particles which subsequently develop into Bacteria, and it is possible that other low forms of life, though certainly not fungus spores, may appear in the same manner. To suppose that these forms spring from invisible germs is to make an hypothesis which is in harmony with our knowledge concerning the origin of other living things. There is no reason why the germs of Bacteria should be visible; and, as Dr. Burdon Sanderson remarks, "there is an immense preponderance of evidence that microzymes do not spring into existence of themselves in the media where they grow."\* There is, moreover, no inconsistency in postulating the existence of invisible germs in the case of living things, and not postulating invisible crystalline germs in the very different case of the appearance of crystals in solutions where the facts necessitate a different explanation.

The experimental methods employed to determine whether living things arise *de novo* are all more or less alike. A fluid known to be capable of supporting the life of low organisms is put into a glass vessel. The vessel is then heated, the fluid is boiled, and the mouth of the vessel hermetically sealed, plugged with wool, or twisted up and down with the intention of the prevention of the access of germs to the fluid. It is admitted now on all hands that prolonged exposure to the action of boiling water destroys all life in solutions; hence, if undoubtedly living things be found in solutions treated as above, from which germs have certainly been excluded, the only possible explanation of the phenomena is that the living things have been evolved *de novo*. Pasteur's experiments made in this manner are well known, and his results were confirmed by Professor Lister and others. Pasteur showed that in a large number of solutions capable of supporting life, when these had been boiled, and proper precautions had been taken to prevent the access of germs, no living things whatever developed themselves. Pasteur attributed the development of all forms of life observed in ordinary exposed solutions to germs almost universally

\* "Second Report of Researches concerning the Intimate Pathology of Contagion," reprinted in *Quart. Journal of Microscop. Science*, No. xlv. p. 315.

present in the air; but Dr. Burdon Sanderson has recently shown that in the case of Bacteria this view can no longer be maintained. His experiments prove that the germs of Bacteria can only be conveyed by water. A solution eminently adapted to the support of Bacteria may remain exposed to the air for any length of time and yet not a single Bacterium will develop in it, whereas the addition of the smallest drop of water will produce Bacteria in abundance. It is very probable that the germs of other low organisms which have hitherto been supposed to reach solutions by means of the air may be found to be communicable like Bacteria only in the wet state. This discovery of Professor Sanderson's is certainly the most important one in this line of research which has been made of late years. Fungi, on the other hand, Professor Sanderson shows, develop in these solutions in quantities directly proportionate to the amount of their exposure to the air, and from these and other considerations concludes that the developmental connection supposed to exist between Bacteria and Fungi, and which, it will be remembered, was maintained by Professor Huxley, can no longer be upheld.

M. Pasteur's well-known experiment of catching the germs from the air on cotton wool, sowing them in solutions devoid of life, and thus causing these solutions to teem with living things, is explained by Dr. Bastian by means of an all-pervading ferment in the air capable of setting up chemical changes in boiled solutions which lead to the development of organisms *de novo*. Dr. Burdon Sanderson's experiments, it would appear from a note (vol. ii. p. 14), are to be similarly explained by an hypothetically all-pervading ferment in water. An all-pervading germ hypothesis is undoubtedly much better than this, and indeed in the case of Dr. Sanderson's experiments the ferment hypothesis will not apply, for the ferment would not be destroyed by mere desiccation without heat. Further experiments of Dr. Sanderson resembling those of Pasteur showed that the development of living things *de novo* does not take place in serum of blood, white of egg, or Pasteur's solution, after they have been heated sufficiently to destroy germs, and also that diminution of atmospheric pressure does not affect the result. There is thus abundance of evidence that living things do not develop in a large number of solutions which are well adapted to their support, and are such as they might therefore be expected to develop in *de novo*, if that event were probable at all; but Dr. Bastian assures us that he obtains the same results with these same solutions, or that in those instances in which his results are different that difference is caused by a modification in the conditions of the experiment, that is to say, a diminution of atmospheric pressure, which Dr. Bastian alleges to be necessary for the production of living things *de novo* in some solutions, while he considers it *favourable* to the attainment of that result in all. Dr. Bastian seals the flasks with which he is experimenting during ebullition of the contained fluid, and by this means, when the apparatus has become cool, a partial vacuum is formed in the vessel. Experiments were made in this manner with hay and turnip infusions, in which every possible precaution appears to have been taken to exclude or destroy germs. In nearly all cases after the lapse of some time the solutions became turbid, or exhibited a scum, and microscopic examination showed the existence of organic bodies in the fluids, and in some cases of Bacteria in active motion.

Now the only possible answer to be made to experiments such as these is that the turbidity or scum in the solutions was not caused by a development of organisms, but by some coagulation or similar alteration in the fluid, and that the bodies seen in the solutions were not living, but dead,

and had been there all the time. It must be noted that it is not stated how long the solutions were kept after filtration before being made use of, and that samples of the solutions do not appear to have been carefully examined beforehand. Other experiments were made with saline solutions, such as ammoniac tartrate with sodic phosphate, in some instances heated after enclosure in the tubes up to 295°–307° F., and maintained at that temperature for four hours.

It is obvious that only experiments with saline solutions bear directly on the question of the original evolution of life. In one such experiment (Expt. g, p. 464) the tube was opened in Professor Sharpey's presence. There was found in it a body, of which a drawing is given, resembling a tuft of Penicillium, and a quantity of similar fungus matter, "in which the remains of the filaments were seen in the form of more or less irregular rows of brownish granules." The disintegration and browning are attributed here to decomposition, but it seems far more probable that they were due to the action of heat. It is further to be noted that tufts of Penicillium spores, such as that here depicted, are believed by botanists to be developed only in the air on the surface of liquids or matrices, whereas this is supposed to have been developed *de novo* entirely beneath the surface of the liquid; and the only authority which Dr. Bastian can give us for the submerged growth of such bodies is M. Pouchet. Moreover, from Dr. Bastian's own observations, it is almost certain that the crystals of ammoniac tartrate employed to make the solution here experimented with contained plenty of fungus matter just like that which was observed (vol. ii. Appendix B, p. xviii), and that therefore such bodies must almost certainly have been originally present in the solution. Further, the filament attached to the tuft of spores has, according to the drawing, its contents coagulated into irregular masses, as if by heat. In a comparative experiment, in which a similar fungus was similarly treated, the plant, though disintegrated, had still sufficient structure remaining in it to allow the easy recognition of mycelium and spores. Most probably, had the experiment been repeated, less alteration in structure might have been observed. There is little doubt that all the Fungi obtained in saline solutions were derived from the crystals employed. Some of the Fungi figured appear to show the action of heat more plainly than in the one we have just considered (*e.g.* fig. 29, c, vol. i.).

It might easily have been determined whether the spores in the experiment were alive or no by placing the mass under the microscope in a suitable fluid, fixing in the field of view one particular spore, which undoubtedly belonged to the mass, and observing whether this spore developed or not. Such an observation would have been crucial; but it was not made in any case. The only attempt made to determine whether the organisms observed in the solutions were living or not was in the case of Expt. 4, vol. i. p. 368. Here *Torulae* obtained from a solution were mounted in glycerine and carbolic acid, and are said to have been found increased in size and number after the lapse of two weeks. But the fluid here employed most probably contained plenty of living *Torulae*, and the whole increase observed may have been due to the multiplication of these. Such is the nature of the evidence which Dr. Bastian thinks it worth while to offer in a work of such pretensions as the present.

The simple faith with which Dr. Bastian looks forward to the conversion of Mr. Herbert Spencer (vol. ii. p. 603) to archebiosis and heterogenesis (this latter in Dr. Bastian's sense), and to the general revolution in science to be brought about by his work, cannot but impress the reader with the firm belief which the author has in his own results. But the absurd statements concerning heterogenesis which

are made in the third part of the book under consideration must tend to render the faith of biologists in Dr. Bastian's powers as an observer extremely small. Three great authorities, Professor Huxley, Dr. Sharpey, and Mr. Berkeley, have been shown by Dr. Bastian the result of some of his experiments. That Professor Huxley was not convinced, but believed that none of the bodies exhibited to him were alive, is well known to all. The opinion of Dr. Sharpey and Mr. Berkeley has unfortunately not been published, but surely, if it were favourable to Dr. Bastian's view, he would not fail to say so. The fact that Dr. Burdon Sanderson gets a negative result in experiments with blood serum, whereas, under the same conditions, Dr. Bastian gets a positive result with solution of beef, an extremely similar substance, cannot fail to generate scepticism concerning Dr. Bastian's operations with other solutions. At all events, in a question of such importance as the present, judgment must be withheld until Dr. Bastian's results are tested by some observer whose name will carry weight with it. This might appear likely to be a long and arduous undertaking, since (significant fact) Dr. Bastian tells us that nothing is easier than to get negative results; but fortunately there is one solution which gives, in 999 cases out of 1000, positive results. And Dr. Bastian appears to be willing to stake the question of archebiosis on this one experiment. The solution is a strong infusion of turnip with a fragment of cheese in it under diminished pressure. It is to be hoped that some one will try this experiment, following Dr. Bastian's methods exactly, with, perhaps, it may be suggested, the further precautions that the flasks employed should be strongly heated just before they are used, and that the observer should, as a preliminary measure, make himself thoroughly acquainted with the appearances presented under the microscope by a fresh strong solution of turnip, in which cheese has been boiled.

It is very difficult to believe that a diminution in atmospheric pressure can have much influence on the formation of organic matter in solutions, and considering, on the one hand, the *à priori* improbability of the formation of Bacteria, &c. *de novo* with the great weight and high value of the evidence already adduced against its occurrence, and estimating, on the other, the value of the evidence here put forth, it seems very unlikely that Dr. Bastian's results will be confirmed.

Part iii. treats of heterogenesis, which term is defined to mean a process whereby the matter of already existing living things gives birth to other living units wholly different from themselves, and having no tendency to revert to the paternal type. That is to say, the spore of an alga can, instead of giving birth to a similar alga, produce a worm. This very process Dr. Bastian affirms actually to occur. It is needless to say that statements such as this are opposed to all the accepted facts and theories of biological science, which are grounded on the laborious investigations of a long series of trustworthy observers, and will not lightly be overthrown on such utterly inconclusive evidence as that here brought forward. That the spores of Algae do not develop into Worms or Rotifers or Tardigrades, but in a very different manner, is the conclusion of botanists who have spent their lives in watching the development and studying the habits of these plants. The supposition of heterogenesis is no new one; it has been raised several times by superficial observers without ever having gained the least ground; but there will probably always be found persons ready to rake it up just as there is always some one to be found ready to square the circle, prove that the earth is flat, deny the persistence of energy, or maintain the existence of psychic force, and to accuse critics of immorality (vol. ii.

p. 435) because they refuse to renounce the fundamental inductions of their respective sciences. There is not space here to notice more than one of Dr. Bastian's observations described as demonstrating the occurrence of heterogenesis. The whole of the evidence brought forward which bears on what would, if proved to occur, be cases of real heterogenesis, for heterogenesis (mixed up in a hopeless manner by the author with alternation of generations) rests on evidence derived from the supposed existence of every gradation between one form and another, than which nothing is more misleading. The case of the supposed development of a Nematoid worm from a resting spore of Vancheria, a freshwater alga, is as follows. Dr. Bastian had a specimen of Vancheria growing in a saucer full of water outside his window. The saucer stayed there some time, and small portions of the plant were repeatedly examined without any Nematoids being seen. The saucer was then taken into a warm room. After four days a number of young Nematoids were found in the water, probably developed from a number of ova present in the water originally, but easily escaping detection from their resemblance to spores, and only hatched on the access of warmth. When further examination was made with the microscope, forms were observed more or less gradational between the resting spores of the Vancheria and bodies exactly resembling the ova of Nematoids, which bodies developed into Nematoids in the ordinary manner. In such a case as this apparent gradations prove nothing, and this is a typical instance of the way in which mistakes of this kind occur. Why, if Dr. Bastian observed this process of heterogenesis going on to the enormous extent described, did he not fix on individual undoubted Vancheria spores, and carefully watch their development? He would then have seen his error; but crucial observations such as these lie outside the province of heterogeny.

Dr. Bastian says that the ova produced by his young Nematoids were much smaller than those within which his young Nematoids were seen to be enclosed, but it may well be that considerable variation in size may exist in the ova produced under various conditions by individuals of the same species.

In conclusion, it should be stated that Dr. Bastian, in order to account for his results, imagines that living matter is endowed with a tendency to develop into certain forms. The wonderful Foraminifera of geological times and the present day, which resemble one another so exactly, were formed originally by archebiosis combined with heterogenesis, and are formed in the same manner now. There is no genetic connection between the two series. Archebiosis and heterogenesis are mere expressions for certain modes of action of the inherent tendency. A number of other terms, also ending in "sis," express other modes of this tendency, many of them being recognised physiological processes known in science by other names. The supposed formation of fungus spores, &c. *de novo* is the result of this "inherent tendency," as is also the development of Nematoids out of Vancheria spores. As far as Dr. Bastian's idea can be gathered, it is this: living matter is formed *de novo* in solutions by the action of chemical forces. At the instant of its formation, it is endowed with an inherent tendency to develop, and in virtue of that tendency takes the form of spores, e.g. capable of at once developing into perfect Fungi. Or, living matter, having taken a Vancheria form, is, in virtue of the "inherent tendency," capable of taking the form of a Nematoid. Now it is obvious that the supposition of a tendency such as this would afford no more explanation of the phenomena, were they really existent, than that of a steam-engine principle would of the motion of the steam-engine. A tendency so complex as to be capable of bringing about the

off-hand formation of a structure so elaborate as that of a Nematoid worm has absolutely no parallel amongst crystalline or other forms of physical force. It is of no avail to call such a tendency organic polarity. It could merely be called vital force. It is this same hypothetical tendency in a rather different shape which it is the chief merit of Mr. Herbert Spencer's philosophy to have been able to dispense with, and with which Mr. Darwin will have nothing to do.

H. N. MOSELEY.

### WOOD IN THE LIAS.

#### TO THE EDITOR OF THE ACADEMY.

Broomfield, Sheffield, October 16, 1872.

SIR,—Professor Thiselton Dyer, in his review of Professor Balfour's recent work on *Palaeontological Botany*, alludes to my paper on the occurrence of non-gymnospermous wood in the Lias. As I pointed out in the paper itself, there was some doubt as to the fact of the specimen having come from the Lias; since I did not find it myself, or obtain it from a source on which implicit reliance could be placed. I still continue to look on its origin as a matter of doubt, and until further evidence in proof of such wood occurring in the Lias has been discovered, I should be sorry if any one were to attribute greater weight to the facts described in my paper than I did and do myself.

H. C. SORBY.

### Notes of Scientific Work.

#### Geology.

**The Cretaceous Flora of North Greenland.**—Among the interesting collections which the Swedish polar expedition of 1870 brought to Europe was a fine suite of fossil plants, collected at the desire of Dr. O. Heer, in Zürich, who in his *Flora Fossilis Arctica* proved that certain black shales at Kome, north of the peninsula Noursoak, belonged to the Cretaceous series. This is now conclusively proved. The specimens brought from Kome are 43 in number, among which Dr. Heer recognises *Filices*, *Rhizocarpeae*, *Equisetaceae*, *Cycadeae*, *Coniferae*, *Monocotyledones*, and *Dicotyledones*. The Ferns are very numerous, *Gleichenia* being peculiarly abundant. The *Cycadeae* and *Coniferae* are also represented by many species, among which *Podozamites Hoheneggeri* is notable, as likewise occurring in the Wernsdorf beds of the Northern Carpathians. Monocotyledons are rare, and only exist as fragments in the collection, while the *Dicotyledones* also are only represented by a few fragments of leaves, most probably belonging to *Populus*. Such a flora, with a preponderance of *Coniferae*, *Cycadeae*, and *Filices*, and *Gleichenia*, *Marattiaceae*, *Dictyophyllum*, and *Cycadeae* in abundance, must be counted a subtropical one. To judge from the presence of *Podozamites Hoheneggeri* and *Eolirion primigenium*, the deposit probably represents the Wernsdorf beds belonging to the Urgonian. This flora has a different climatic character from the Miocene flora of Greenland, in which respect it agrees with the Lower Cretaceous flora of Central Germany. Similar black shales have also been found at the south side of the Noursoak peninsula, near Atane, and at about 800 feet below the well-known Miocene bed. Here also the shales contain plants belonging to a higher horizon of the Cretaceous series. There are 45 species known; among them being *Filices*, *Cycadeae*, *Coniferae*, *Monocotyledones*, and *Dicotyledones*. *Coniferae* are again numerous, but Ferns are rare. Of *Monocotyledones* only a *Bambusium* and two other species are known. The difference between the Atane beds and those of Kome chiefly consists in the great preponderance of *Dicotyledones* in the latter, which, as in the Upper Cretaceous of Germany, are presented by great variety of types. A point of great interest is the discovery in these beds of a beautiful species of fig-tree with leaves and fruit attached. In Central Europe *Dicotyledones* make their first appearance in the Cenomanian, and are very abundant in the Senonian near Aix-la-Chapelle. It is curious that both in Greenland and in Central Europe the *Dicotyledones* display a great variety of types in the Upper Cretaceous series, but are nearly wanting in the Lower Cretaceous. It seems to point to a great change having taken place in the flora between our latitude and 71° N. after the deposition of the Gault. (*Zeitschrift der deutschen geologischen Gesellschaft*, part i. 155.)

**The Geology of the Province of Moscow.**—Under this title II. Trautschold has published in the *Zeitschrift der deutschen geologischen Gesellschaft*, part ii. 361, an important report on his geological survey of this province, undertaken by the request of the Mineralogical Society of St. Petersburg; a more detailed report in the Russian language is to appear hereafter. The mountain limestone of this district is highly fossiliferous, and chiefly consists of grey limestones alternating with clayey beds; it is usually exposed by rivers, and rarely forms hills; and

though usually horizontal, near Serspuchof and Kalomna shows an easterly and south-easterly dip: over the mountain limestone lie Oolitic strata. The author explains the absence of Permian, Triassic, and Liassic strata by supposing that during the time of their deposition this region was dry land, and expresses his belief that during the Middle Oolitic period the upheaval of the Ural Mountains caused a depression of Central Russia and its overflow by the sea. The Cretaceous beds of the province are also the most northern deposits of this age in Russia; they are only in part marine, and these are found in the north-eastern portion of the province, the freshwater deposits being confined to the north-western division. They belong to three members of the Cretaceous series, the Gault, Upper Greensand, and Lower White Chalk.

**Austrian Geology.**—The director of the Austrian Geological Survey, Franz Ritter von Hauer, has printed in the *Jahrbuch der k. k. geologischen Reichsanstalt*, part ii. p. 1, a complete index of all the names of the different rocks, formations, zones, beds, and strata in use in geological surveying, or applied by others to Austrian stratigraphy. By giving the date of the first application of each name, with its author, and an ample description of the stratum or rock bearing it, he has provided a very valuable and handy list of reference for geologists, both Austrian and foreign.

**Lower Silurian in Thuringia.**—In the *Zeitschrift der deutschen geologischen Gesellschaft*, part i. p. 72, R. Richter gives a detailed description of a group of strata, evidently belonging to the Lower Silurian. Its base is formed by dark slates, which have as yet only yielded Trilobites, two species of the genera *Calymene* and *Asaphus*; large quantities of red haematite occur in these slates. Quartzite forms the roof of this stratum, and bears on its upper side thin beds entirely composed of Brachiopoda shells. The quartzite is covered by further slates, the fossils of which, however, are confined to the accompanying iron ore. In this he found Brachiopoda, amongst which only *Discinae* were discernible. The upper portion of this horizon again is formed of quartzites, in which a species of *Beyrichia* occurs.

**The Geology of the Czipka Balkan.**—F. Schröckenstein contributes a short paper to the *Jahrbuch der k. k. geologischen Reichsanstalt*, 1872, No. 2, p. 235, on two sections which he has made through the Czipka Balkan, in which he met with the Carboniferous formation, Dyas beds, and Cretaceous strata. The Carboniferous formation, resting on Palaeozoic beds, which, in turn, overlies crystalline rocks, is formed of quartzites, limestones, and shales, and Coal-bearing sandstone and shales, the latter of which immediately accompany the coal-seams. The Dyas formation overlies the Coal-measures in patches, and consists of light-coloured dolomite, red and yellow sandstone, which likewise contains beds of coal. He considers these to represent the Middle Dyas; a mass of grey marls and quartzites, with dark dolomites and limestone, takes the place of the Zechstein. This group of strata then stands between the German Dyas and Russian Permian, and near the Upper division of the former.

**On Pteraspis.**—In his work on Fossil Fishes, Agassiz pronounced some fossil remains from the Devonian of England to be those of three new species of *Cephalaspis*. In 1847 Kner examined similar fossils from the Upper Silurian of Galicia, which, like two of Agassiz' new species, he considered to be the inner shells of Cephalopods, for which he proposed the generic name of *Pteraspis*. F. Römer, in 1856, named a similar form, from the Eifel, *Palaeothetis Dunensis*. Mr. Salter, Prof. Huxley, and Sir Philip Egerton afterwards added to our knowledge of these doubtful remains, and they all arrived at the conclusion that they belonged to fossil fish; while Dr. Lankester subsequently described them as such, in a monograph published by the Palaeontographical Society of London. He divides the *Cephalaspidae* into two orders: the *Osteostraci*, with *Cephalaspis Lyelli*, and *Heterostraci*, with *Pteraspis*, basing his distinction on a difference in the nature of the shells. The *Heterostraci* he has divided into *Scaphaspis*, *Cyathaspis*, and *Pteraspis*. A. Kunth now describes, in *Zeitschrift der deutschen geologischen Gesellsch.* part ii. p. 1, a new species of *Pteraspis* occurring in the hard Graptolite limestone boulders of the diluvium of Berlin. The specimen possesses a head shield that in every respect corresponds with that of *Cyathaspis Banksii*. The other side is formed by what Lankester calls *Scaphaspis truncatus*. Connecting these two parts, he found a number of plates representing segments. It appears, then, that this is a specimen not of a fish, but a crustacean. Kunth calls this remarkable new species *Cyathaspis (Pteraspis) integer*.

**The Trias of the South Bakonyer Wald.**—The Trias of the Bakonyer Wald, the eastern continuation of the Alps, consists, according to T. Böckh, of the following strata:—1. *Rhaetic Formation*: a. Dachstein limestone, with *Megalodus triquetus*, &c. 2. *The Upper Trias*, consisting of: a. Central dolomite, with *Megalodus complanatus*, *Turbo solitarius*, &c.; b. The Upper Marl group, comprising: a. Bed with *Avicula aspera*, *Waldheimia Stoppani*, &c.; b. Bed with *Trachyceras Attila*, *Trachyceras Bakonicum*, &c.; c. Fureder limestone, with *Halobia Lomelli*, &c.; d. Horizon of *Arcestes Tridentinus*; e. Horizon of *Ceratites Reitzii*, and non-fossiliferous quartzites. 3. *The Lower Trias*, consisting of: a. Muschelkalk, comprising: a. Horizon of *Arcestes*

*Studer*;  $\beta$ . Horizon of *Rhynchonella decurdata*, &c.;  $\gamma$ . Forrashegy yellow, bituminous, dolomitic marls;  $\delta$ . Megyehegy dolomite, with *Amm. Balatonicus*, &c.;  $\epsilon$ . Laminated limestone, with *Myophoria*, &c.; and  $\delta$ . Bunter sandstone, made up of:  $\alpha$ . Porous Rauchwacke and dolomite;  $\beta$ . Thinly laminated shales, sandstones, and marls, with *Myophoria costata*, &c.; and  $\gamma$ . Red sandstone with conglomerate. (*A. magyar Kiraly földtani int. évkönyviből*, vol. ii. part 2.)

### Anthropology.

**The Different Periods of the Bronze Age.**—Among the papers read at the Archaeological Congress at Bologna, and published in the French journal *Matériaux pour l'Histoire primitive et naturelle de l'Homme*, 8th year, 2nd series, several are directed to the determination of the various stages of development observable in the remains of the so-called Bronze age found in Sweden. These remains had been separated by MM. Nilsson and Worsaae into three classes, each corresponding with some notable peculiarity in the tombs in which they were found: those of the first class, for instance, being found in large stone cists containing one or more skeletons, those of the third class in small cinerary urns, and those of the intermediate class in large stone cists containing calcined bones. The object of the first paper to which we would refer (p. 174) is to illustrate these three varieties of bronze work. The first variety, says M. Oscar Montelius, the author of the paper under notice, is ornamented with linear and spiral patterns, drawn on the mould from which the object is cast. The second variety is less elegant, and ornamented chiefly with concentric circles, which are worked upon the bronze by a tool, not on the mould. The different character of the tombs in which the objects of this class are found suggests the idea of their being the result of some external influence. The third variety corresponds in type with the first, but the two classes are only exceptionally found side by side: celts, for instance, which are very common in this last variety, being unknown in the first. While most of the objects of the third variety are undoubtedly the product of native Swedish industry, there is one, a buckler, or perhaps the lid of a cista, which M. Montelius regards as of Italian workmanship, supposing it to have found its way to Sweden in the course of trade between the north and south of Europe. He must have been led to this conjecture, we imagine, by the border composed of very rude figures of swans, which forms the principal ornament of the buckler, and certainly presents a striking contrast to the ornaments consisting of mere linear patterns which prevail among the northern remains of the Bronze age. It is also true that bronze utensils of various kinds, with similar patterns composed of exceedingly rude figures of animals and even of men, have been found in Etruscan tombs (p. 184; compare *Archæologia*, xli. pl. 4, 7, 9). It may be as he conjectures, but it is difficult to believe that an object so rude could ever be prized by people familiar with work of such nicety and good taste as may be seen in fig. 1 of the illustrations of this paper. On the other hand, there would be no difficulty in accepting his conjecture if archaeologists would permit us to reverse the order of progress which they have laid down in these matters as commencing with mere linear patterns and going on to figures of animals and men. Figures of animals are to be seen rudely scratched on bones found in cave-dwellings, but no linear patterns or ornaments, so far as we remember. It should also be observed that among the Etruscan tombs which have yielded bronze utensils ornamented with rude figures of animals and men, those of Praeneste are regarded as examples of the very earliest Italian tombs. One of the objects found at Praeneste is now in the British Museum, and whether for the purpose to which it was applied, or the ornaments upon it, is equally the subject of surmise. The vases found in excavations at the Campo Santo at Bologna, and engraved at p. 184, give a correct notion of the style of work in question.—A second paper, read at the same congress by M. Hildebrandt, and reported as above (p. 172), is devoted to a comparison of the ancient bronze fibulae of the north of Europe with those of the south, the result being so marked a difference in an artistic point of view that the one cannot be supposed to have originated through any influence of the other. This being the case, M. Hildebrandt proposes that we should look to Asia Minor for a prototype which would harmonize with both.

**The Primitive Inhabitants of Italy.**—A third paper (reported as above, p. 94), by the learned Count Conestabile, deals with the primitive inhabitants of Italy, commencing with a description of the four successive immigrations of branches of the Aryan race into Europe from their primitive settlements in Bactria and Sogdiana. 1. The Celtic branch, taking a direction south and west of the Caspian Sea, occupying first the regions of the Caucasus, and afterwards advancing along the Danube towards the centre and west of Europe. 2. The Germanic branch, taking a more northerly route, passing through Scythia and Sarmatia, reaching ultimately the shores of the Baltic, and penetrating into Scandinavia. 3. The Slavic race, passing through Sarmatia, taking the route of the Volga, and settling in Russia, Lithuania, Bohemia, Illyria, and Servia. 4. The Aryan-Pelasgic race, leaving the common settlement a little after the Celtic branch, passing along the south of the Caspian, and advancing into Asia Minor and on to the Hellespont,

across which bodies of them passed on two occasions, and spread, on the first, in Thrace, Northern Greece, Illyria, and the north of Italy, while, on the second, they descended into Italy, driving the previous inhabitants to the extreme south. The next immigration of the Aryan-Pelasgic race into Italy took place by sea, the points of landing being Calabria in the south and the mouth of the Po in the north. The last immigrants were the Pelasgo-Tyrrhenian or Etruscan colonists, who came direct from Asia. Between the first incursions of the Aryans into Europe, which are stated to have taken place about the thirtieth century B.C., and the arrival of the Etruscan colonists, a period of about fifteen centuries elapsed. That the Etruscans had attained a considerable influence in Europe by the fourteenth century B.C. may be gathered from the evidence of the hieroglyphic inscription at Carnac, in which a victory is recorded to have been gained at that date by the king of Egypt, over certain confederate enemies "from the islands and regions of the sea," among whose names occurs that of the *Turscha*, which, when we consider that the other allies are spoken of as Lycians, Achæans, Sicilians, &c., there is no difficulty in recognising to be identical with the archaic forms *Tursce*, *Turschen*, *Tusce*. The *Turscha* took the chief part in the expedition. The advent into Italy of colonists familiar, as the Etruscans were, with many forms of industry, and much addicted to commerce, gave no doubt a great impulse to industry throughout Europe. At the same time it is not correct to trace the introduction of working in bronze into northern Europe to the Etruscans alone. For contemporary with them, and rivals in skill in working metals, as well as in commercial enterprise, were the Phœnicians, whose visits to the west of Europe are matters of historical fact.

The fourth volume of the *Transactions and Proceedings of the New Zealand Institute*, conducted by Dr. Hector, has just reached us. The most important papers are as follow:—1. "Ethnographical Considerations on the Whence of the Maoris;" by J. T. Thomson. Mr. Thomson, after incidentally mentioning that native tradition has pointed out the Navigators' Islands as the earlier home of the Maoris, proceeds to base his conclusions on the evidence afforded by physical form, customs, and language. He illustrates his subject by vocabularies of words and numbers and by maps, and arrives at the following results: 1st. That Hindostan as well as the Indian Archipelago contained at one time a Negro population. 2nd. That waves of migration issued from the South Peninsula, or Barata, in both an eastern and western direction. 3rd. That no western emigration ever proceeded out of Tamasak, or the south part of the peninsula of Malacca, or Sumatra, so as to affect Madagascar. 4th. That the progress of the Barata is traceable eastward by language as far as the Moluccas, of which Ternati is the principal settlement. 5th. That the race was modified in colour and physiognomy, but not in language, by the incursions of the Mangians and Anamese. 6th. With the Moluccas as a basis, a stream of the mixed races flowed eastwards, from island to island, over Polynesia—one branch finding its way to New Zealand, via Tongataboo. 7th. Barata, or South India, was, therefore, the Whence of the Maori.—2. "Moas and Moa Hunters;" by Dr. Haast; with notes by the Rev. J. W. Stack. Dr. Haast illustrates his paper with a map of the moa hunters' encampment at the mouth of the Rakaia river, and a plate of implements of obsidian and of chipped stone found in association with moa remains in that locality. The author discusses the evidence of the antiquity of the *Dinornis* at great length, and arrives at the following conclusions: 1st. The different species of the *Dinornis*, or moa, began to appear and flourish in New Zealand in post-Pliocene times. 2nd. They have been extinct for so long a time that no trustworthy traditions respecting their existence have been handed down to us. 3rd. A race of *Autochthonos*, probably of Polynesian origin, was contemporaneous with the moa, by whom the huge wingless birds were hunted and exterminated. 4th. A species of wild dog was contemporaneous with them, which was likewise killed and eaten by the moa hunters. 5th. They did not possess a domesticated dog. 6th. They were low in civilisation, only using rudely chipped stone implements; the Maoris, their descendants, on the other hand, had, when the earliest Europeans arrived in New Zealand, attained the art of manufacturing finely polished stone implements and weapons. 7th. The moa hunters cooked their food in the same manner as the Maoris of the present day, but they were not cannibals. 8th. The moa hunters had access to the Northern Island, whence they procured obsidian. 9th. They also travelled far into the interior of the island to obtain flint, of which some of their stone implements were made. 10th. They did not possess implements of nephrite or greenstone. 11th. The art of polishing stone implements is of considerable antiquity in New Zealand, and as they only possessed chipped stone implements, this furnishes an additional proof of the long extinction of the moa.

**The Occurrence of Face-Urns in Brasil.**—Professor C. F. Hartt has published a drawing and description, in the *American Naturalist* for October, of a well-preserved urn of this kind, from a cave on the Rio Maracá, a little river in the province of Pará. The awkward turning forward of the elbows of the figure—a male one—is remarkable. The urn contains part of a human skeleton, which shows no traces of having been burnt. On the floor of the grotto where this urn was found

fragments of other urns have since been met with; some had a similar shape, others had the bodies of armadillos and tortoises, with human faces. The author has quite recently restored from fragments a female face-urn from the Ilha do Pacoval, in Lake Arary Marajó, the upper part of which is rounded to represent a head with human features, and possesses pieces of another urn which has two faces.

At the third general meeting of the *Deutsche anthropologische Gesellschaft*, held at Stuttgart, Professor Virchow read a paper combating the view pronounced by M. Quatrefages in the *Revue des deux Mondes*, and in a more recent lecture, that the present Prussian people had sprung from a race of Finns. He further endeavoured to show that they received civilisation from the French who emigrated after the revocation of the Edict of Nantes, and that they are anthropologically different from the people of South Germany. A condensed report of Professor Virchow's comments is given in *Ausland*, No. 42, 997. He finds that Quatrefages bases this theory on too scanty material and altogether insufficient grounds. The hypothesis, at one time so universally held, says Virchow, that all longheaded skulls were Celtic, may now be taken as an example of how easy it is to overstep the mark, and of the caution that should be exercised in anthropological enquiries. Any conclusions that may be drawn from the forms of skulls of early times are quite open to question. The influence of culture has hitherto been too little considered. Schaffhausen has observed that the growth of the skull continues to a later period than was formerly supposed, and that it increases in breadth in old age. This explains how it happens that so many more of the long and narrow skulls have been traced to earlier times, and that the proportion of the broader ones increases in the quaternary epoch. In the case of the broad skulls the brain has usually attained fuller development, while the most remarkable long and narrow skulls are to be met with among lower races. For this reason, then, peculiarities of races become obliterated in time.—*Die anthropologische Gesellschaft*, which now numbers 1358 members, will hold its next annual meeting at Wiesbaden.

The *Bulletin de Académie royale des Sciences de Belgique*, No. 7, contains a note by G. Dewalque, announcing the discovery of wheat in a bone-cave in Namur. An exploration of this cave, which is near Jemelle, was made by Professor Cousin, of Louvain, who found some bone implements, together with numbers of human bones. During a later visit more human bones, and a somewhat abundant quantity of wheat, were discovered in a stratum of angular flints. The wheat appeared to have been charred, and though it is decidedly smaller in size than our ordinary grain, the author does not hesitate to affirm that the material he has found is cultivated wheat.

Since our notice (*Academy*, vol. iii. p. 320) of the reports from Zürich of university and medical education for women, a little book has been published giving an account of the legal and professional aspect of the same question at Edinburgh. The writer, Miss Jex-Blake, is one of several ladies who were allowed to matriculate as medical students at that university in October 1869, but the full importance of the concession was not apparently understood by the authorities at the time, and their attempts to withdraw it without legal cause have given rise to litigation which is scarcely likely to end in their favour. The statutes of the university make no mention of the sex of students, and the governing body is consequently free to receive women on the same terms as boys if it pleases, but the practice of centuries is held to have barred the right of women to claim admission if it is refused. Once matriculated, the ladies are entitled to all necessary facilities for study and—which is the point in dispute—have a claim to be enabled to fulfil whatever formal conditions are imposed upon students desirous to graduate in medicine or any other faculty they have selected. The importance of the question being tried at Edinburgh appears from Miss Jex-Blake's book to be that, if that university breaks faith with its *alumnæ*, English women intending to study medicine will have to do so either in America, France, Switzerland, or Italy, and as no foreign degrees are legally recognised in this country, and a Paris graduate is placed on the same footing with the most unscrupulous female charlatan, it is to be feared that the actual demand for lady-doctors will tempt unqualified practitioners into the unprotected or unregulated half of the medical profession. The book is worth consulting as a clear and temperate summary of the past history and present state of a controversy that is likely to last some time, and was embittered, as appeared from the newspapers a year or two ago, by the discovery that some of the ladies could compete successfully for open endowments.

### History.

- Gustavus Adolphus in Germany, and other Lectures on the Thirty Years' War. By R. C. Trench, Archbishop of Dublin. Second Edition. Macmillan.

THIS is practically a new work, though two of the lectures were published seven years ago. We have of late had so little that is worth reading in English on the subject (except Mr. Ward's *House of Austria in the Thirty Years' War*) that this account of the general and social aspects and results of the great religious struggle of the seventeenth century is peculiarly welcome. And yet few foreign events were ever watched in England and Scotland with more interest. The old book called *The Swedish Intelligencer*, published in numbers from time to time, was a remarkable one for that age, and Lockhart's account in the *Harleian Miscellany*, as well as Monro's, shows how many volunteers from this island were serving in the Swedish ranks. The character of Gustavus has been assailed of late years by some writers on the ground that he was not fighting for religion so much as "for his own hand," and was in fact a self-seeking robber who did much to break up the unity of the Empire. It is true that he had been long alarmed at the Austrian conquests, and still more at their plan of getting a firm footing on the Baltic with a view to rooting out Protestantism from the North. But it is the happiest of all causes when in defending his own nation such a leader is defending also great and universal interests. Such was Elizabeth's war against Spain, and such Gustavus' campaign against Tilly and Wallenstein. It must be remembered that Richelieu,

whose ultimate policy was to humble the house of Hapsburg, had enough on his hands at the moment owing to his unfortunate resolution to destroy the local independence of the Protestants in France, and make the monarchy absolute, when probably conciliation would have given him the command of a splendid force of sailors from Rochelle and the west coast and not inconsiderable help by land. It was at this moment when the cause of North Germany seemed lost that Gustavus Adolphus landed at the mouth of the Oder, with something of the feelings of one of the old heroes raised up to deliver the chosen people from bondage. The Elector of Brandenburg was a miserable incapable—one of the few such whom the house of Hohenzollern has produced; the Elector of Saxony was, if possible, worse; Christian of Denmark had failed, not being supported properly by his nephew, our Charles I., who was now involving himself hopelessly in the contest with his own subjects; Gustavus was the sole remaining hope. Archbishop Trench has not gone at length into the military events, as his main object has been to show the social results of the war of religion on the country. The Jesuits, by influencing Ferdinand II. of Austria and Maximilian of Bavaria to this war, brought on Germany a destruction like that which Innocent III. brought on South France by the Albigensian crusade. We must refer to the Archbishop's book for the details, which he has excellently illustrated from the popular poems of the time, and from the fortunes of the clergy and of the universities, drawing his materials from Opel and Cohn's *Historische Lieder aus dem dreissigjährigen Kriege*, and from Tholuck and others. The list of works given in the preface shows how much has been lately done in Germany for the history; we may expect soon Mr. Motley's book on the war, which will form the third part of his great work. Meanwhile we would recommend the Archbishop's book as containing an admirable series of sketches on the subject. He has illustrated it from his own special line of enquiry by adducing the new words introduced at this period, such as "plunder" and "marauding," and well brought out the influence of France on the German language during the war, which ended in giving Louis XIV. Alsace as his share of the spoil of the dismembered land, a thing Germany has neither forgotten nor forgiven. He quotes on this a *mot*, ascribed to Ranke. "After the capitulation of Sedan and the surrender of the French Emperor, an Englishman, who thought the war should now cease, asked the historian across a table at Berlin, 'But whom are you making war on now?'—'Louis XIV.,' was the reply." C. W. BOASE.

#### RECENT EDITIONS IN THE ROLLS SERIES.

REGISTRUM *Abbatiae Johannis Whethamstede, Abbatii Monasterii S. Albani, iterum susceptae*. Ed. H. T. Riley.—This is one of the Registers of the Abbots of the fifteenth century, the publication of which will complete the series of St. Alban's Chronicles and Documents for which we are indebted to Mr. Riley. Whethamstede's Register used to be ascribed to Robert Blakeney, a chaplain of the abbey, but he was only the possessor, not the author, of the book, which was at a later period the property of Lord W. Howard, more famous as "Belted Will," who mentions his buying it for twenty shillings in 1589. It is now in the Arundel collection of manuscripts at the College of Arms. It was probably a compilation from various sources made shortly after Whethamstede's death by some now unknown hand. No doubt the abbey registers were used for the work, but the abuse poured on William Walingforde, who was the abbot's right-hand man, shows that it came from an alien pen, and it was probably composed just before 1476. The point is important because inferences have been drawn from Whethamstede's supposed authorship. Hallam, for instance, does so towards the close of the eighth

chapter of his *Middle Ages*; and so on the vexed question of the murder of Humphrey, the "good" duke of Gloucester, "Whethamstede" has been quoted as saying that he died of grief and sickness, the abbot being a warm friend of Gloucester. The register contains the account of the first and second battles of St. Albans, 1455 and 1461, in which the abbey suffered so much. This changes the registrar from a violent Lancastrian into a Yorkist. "His change of party is quite sudden and amusing enough." Mr. Riley, however, means to bring these matters under our notice more at length in the introduction to the succeeding volume. We trust the completion of his St. Albans series will be only the middle point of the services which he has rendered to the history of old London and its neighbourhood.

*Calendar of the State Papers relating to Ireland of the Reign of James I., 1603-6*. Edited by the Rev. C. W. Russell and J. P. Prendergast, Esq.—The unfortunate history of Ireland is well represented in the state of the papers from which this Calendar has been compiled. They are scattered far and wide, and the Master of the Rolls has wisely sanctioned a complete account of them all, instead of confining the task of the editors to the comparatively small collection contained in the Record Office. There are only thirty-two Irish entries in Bp. Stapledon's Kalendar formed during Edward II.'s reign (some of which are illustrated in the editor's preface). There is no notice of any Council Book in Ireland prior to Henry VIII., and most of the later ones have been destroyed. The leading statesmen kept possession of state papers much more than was done in England, and hence the importance of the Chichester, Fitzwilliam, and Ormonde documents, of which Carte the historian had the use: the Conway collection supplies much, especially in the docquets (or summaries) of letters, and of course Sir Robert Cotton, our great antiquary—perhaps not very careful in returning what he had borrowed, as was the way with antiquaries—had added much interesting Irish material to his stores. Of all these, as well as of the Carte and Carew papers, the editors give a very interesting sketch. Some volumes got as far as Philadelphia, and were generously restored by the directors to the English national archives in 1867. The most interesting part of the reign is not yet reached, that of the plantation of Ulster by the new English and Scotch colonies, to illustrate which there were a series of maps of the six escheated counties; two of which, Derry and Donegal, have unfortunately not yet been found. Those of Armagh, Cavan, Fermanagh, and Tyrone, have been reproduced by photo-zincography and coloured. And we cannot but approve of the editor's plan, to give full details of all lists of names of persons and places, and, in fact, a somewhat fuller analysis of the papers than is given in the English calendars, where it is often provoking to find one person or place mentioned, with an "&c." or "and others" following, when the historical importance of the entry depends on the lists of names concerned with public affairs, conspiracies, and the like. Mr. Prendergast, in especial, has made the subject of the English settlements in Ireland his own, so that we look for considerable historical help from the forthcoming volumes. James tried to pacify the Scotch borders by transplanting the Grahams and other inhabitants of Leven, Esk, and Sark into Ireland, and a subscription was made throughout Cumberland and Westmoreland to procure them convenient farms. It is these details of the social condition of the country which are unfortunately omitted in the ordinary histories of James's reign, while the doings of the favourites Carr and Villiers are chronicled at length. Some day we may have a history of the kingdom as well as one of the king.

*Memoriale Fratris Walleri de Coventria*. Ed. W. Stubbs, Regius Professor of Modern History in the University of Oxford. Vol. I.—The historical collections of Walter of Coventry having been praised by Leland, our German friends have been constantly urging its publication. Unfortunately the book is a mere compilation, and we already possess what it has to tell us in other forms. It was right to publish it however, for it completes the series of works connected with Benedict of Peterborough and Roger Hoveden, and supplies an interesting instance of that process of abridgment and adaptation by which the successive mediaeval chroniclers provided for the historical wants of their own time, and gives some help towards disentangling the com-

plicated relations between their several works. It also helps us to correct the text of previous authors, *e.g.* Walter had a better copy of Florence of Worcester before him than our present printed editions supply. It was written, and Walter of Coventry lived, between 1293 and the end of the reign of Edward I.; he probably wrote in the diocese of York (as the local indications seem to show), and used some previous compilation, such as the Harleian MS. 3860, while the coincidences in expression with the extracts from the ancient chronicles published by Edward I. in the great roll (*Foedera*, i. 769) seem to point to the conclusion that the two compositions were drawn up in concert, or the one abridged from the other. Professor Stubbs gives an amusing account of the conjectural way in which Bale and Pits and later bibliographers have evolved a biography of Walter, of whom they knew nothing whatever beyond his name. Modern biographers more ingeniously write a "life and times" of their authors, where "the times" play nearly the whole part. The historical illustration of the period is reserved by the editor for the preface to the second volume, on the appearance of which we hope to return to the subject.

*Calendar of the Clarendon State Papers*, preserved in the Bodleian Library. Vol. I., to January 1649. Ed. by O. Ogle and W. H. Bliss.—This has been drawn up on the pattern of the Calendars of State Papers in the Rolls Series. The most important of the documents collected by the great English historian were published in three volumes folio, but this calendar supplies many details and some corrections, not only to the published volumes, but to Clarendon's own history. A further acquisition to the collection was made so lately as 1860, when other papers, enclosed in boxes and in Lord Clarendon's private writing chest, were sent by the trustees of the bequest made to the university by the third earl in 1753. "It may be worth observing that in this *escritoire* are the writing materials used by Lord Clarendon himself—pens, silk, wax, pounce-box, and scissors—just as he left them." The many letters of the king and queen form a valuable part of the collection. Above 300 letters of state, addressed by Queen Elizabeth to foreign princes in the early years of her reign, are calendared as *addenda*. There are many interesting notices of Hyde himself, and of the preparations he made for his history, which he called "A Book of Martyrs"; the documents show even more than the history the amount of discord among the king's generals, especially in the West. One note states "how odious Lord Culpeper, *Sir Edward Hyde*, and Lord Hopton are to the commissioners, gentry, and county of Devon generally." On the other hand, there are complaints against Lord Goring for misapplying and embezzling contributions, and Hyde says of him, "he does nothing but drink and play." There are curious details of the money levied in different parts of the country; in fact, we much want a budget of both sides during the war, the levies of men and money are not at all explained in the common histories; the lists are also of value as showing the relative importance of different parts of the country, which of course differed much from what it is at present. Some of the early entries show Charles' love for art—he procures pictures from Spain, and desires plaster moulds "of the marble heads of Julius Caesar, Marcus Marcellus, and Hannibal, at Aranjuez"; and "Velasquez, the king's painter, certifies that the heads sent are correct, that of Hannibal only being doubtful, there being so few statues of him existing." Now and then we have a note by the editors, such as the following—"Reference is made to this letter in *Hist. Rebell.* book ix. p. 544, but the words and tone are *entirely different* from those quoted there." C. W. BOASE.

### Intelligence.

It was to be expected that the success of the new Imperial University at Strassburg during its first summer term would not be very great. The lectures were attended by no more than 212 students, of whom about 130 came from various parts of Germany, the rest being natives of Elsass. There is hardly a doubt that most of those belonging to the first category will not return for the winter, as they felt rather uncomfortable in the midst of a sulky population, and did not meet that kind of social accommodation to which the academical youth of Germany is accustomed elsewhere. Their successors will probably be better able to accommodate themselves. A short time ago there appeared a similar feeling of discouragement among the professors, though most of them had accepted their new chairs with rather a superabundance of enthu-

siasm. This reaction, as it appeared, was chiefly owing to the fact that Professor A. Springer, the eloquent historian of art, exchanged Strassburg so very soon for a more secure and lucrative chair in the University of Leipzig, whilst Professor Brunner accepted a place in the faculty of law at Berlin. These, however, are occurrences which happen more or less continually in all the other German universities. And it is scarcely just or generous, after a six months' experiment, to give utterance to the suggestion that that of Strassburg may after all prove a failure. It will be time to arrive at an opinion on this point in five or, say, ten years hence, when plenty of evidence will have been collected, whether or no a distinguished corporation, for the most part carefully composed of the best men in the various academical disciplines and richly endowed, has spread its attractions both over cis- and trans-Rhenane Germany. It may not be amiss to remind the Strassburg professors and scholars that the University of Berlin, at the time of its foundation in 1810-11, was attended by 256 and after the War of Liberation in 1817 even by no more than 198 students. Fortunately, with the beginning of the winter term, a second batch of professors will join those who have already entered upon their duties at Strassburg. Prominent among these are: in the faculty of divinity, Dr. Schulz, from Basel, and Dr. Zoepffel, from Göttingen, the author of the excellent book on the history and ceremonies of papal election, which we reviewed a short time ago. Dr. Geffcken, from Hamburg, formerly Hanseatic *chargé d'affaires* in London and Berlin, has accepted a chair for public law; and Dr. R. Sohm, from Freiburg, will lecture on German and canon law. Among the new arrivals we are moreover glad to notice Dr. G. Schmoller, from Halle, a leading representative of the younger school of political economists in Germany; Dr. A. Michaelis, the author of the great work on the Parthenon, which has lately been so favourably received by English critics; Dr. W. Scheer, of Vienna, and Dr. E. Boehmer, of Halle, the one a rising authority in the history of German, the other in the Romance languages and literatures.

G. Droysen, junior, the author of a very substantial life of Gustavus Adolphus, hitherto professor extraordinary in Göttingen, has been advanced to an ordinary chair of history in the University of Halle, in the place of H. Leo, the well known and eccentric historian and linguist, who is retiring on account of old age.

The faculty at Tübingen was very anxious to fill its vacant professorship of history by calling Dr. Max Büdinger, of Zürich, most favourably known as a first-rate teacher, and learned in almost every branch of ancient and modern history; but the people at Vienna were quicker and decidedly more liberal in their offers than the Saxon authorities, and have succeeded in securing his services. This failure is owing not only to the ignorance, but chiefly to the intolerance, of the timid and irresolute Württemberg government: Büdinger, with all his sound Christian learning, being unfortunately a Jew.

### Contents of the Journals.

*Hermes* (vol. vii. part 1) has articles on Diogenes, who did service in freeing Athens after the death of Demetrius, B.C. 229; the Roman Senate's days of meeting under the later republic; the inscriptions found by our countryman Wood at Ephesus; the Greek proper names on coins; the family of T. Flavius Alkibiades (among the later Athenian Archons); and an Argive inscription interesting for the dialect and for the account of money contributions reckoned by two standards, Aeginetan and Attic.

*Bullettino dell' Istituto* (September and October) describes the excavations in the Forum, which were interrupted by so many water-springs (one remembers the fountain of Juturna and the Curtian Lake) that it became necessary to discover the course of the old Cloaca Maxima and clear part of it to let the water run off. The progress of the works has now settled the question as to the limits of the Forum Romanum (Regio VIII.).—An inscription of Smyrna, containing a decree of the Ionian Confederacy, and some at Athens, marking the boundary of the Cerameicus, are also given.

*Revue des deux Mondes* (October 15) contains good articles on the political and educational views of Rabelais, and Sixtus V.'s church policy in France.—An article on Jerome Bonaparte's kingdom of Westphalia shows how Napoleon destroyed his own work by the monstrous levies of men and money required of his subject kingdoms.

*Preussische Jahrbücher* (October) describes the political importance of the upper valley of the Rhine in the time of the Emperor Frederick II. At Trifels was the treasury of the empire, close by the Scharfenburg, where Richard Coeur de Lion was imprisoned.—There is a good account of the origin of the Zollverein, which, by bringing about commercial unity, gave a firm basis to schemes of political union.

*British Quarterly Review*, October, contains an article, by a well-known and unmistakable writer, on "The Goths at Ravenna," describing the historical greatness of the city, and the existing monuments which are the records of that greatness—in the age when the Roman and the Teutonic elements of the modern world stood side by side, and neither had as yet absorbed the other.

**Philology.**

**The Study of Philology.** [*Wie studirt man Philologie?* Eine Hodegetik für Jünger dieser Wissenschaft. Von Wilhelm Freund.] Leipzig : Wilhelm Violet.

Τῆς δ' ἀρετῆς ἰδρύματα. Instead of the whole verse, Herr Freund has placed this fragment as a motto at the head of his book, which it characterizes more aptly than he can have himself intended. A little of everything, but of some things too much in proportion to their importance, of others equally necessary too little, "almost nothing," sometimes indeed "nothing at all." In the introductory "Letter to a Young Friend," it is explained that the book owes its origin to the intercourse between the author and a number of diligent young disciples, brought about by a book published some years ago and advertised on the cover of his present work, an "asses' bridge," as they say in my country, for the matriculation examination, called *Prima*. The enquiries which he had to answer respecting the nature, the character, the extent, or the methods of philological study, suggested to him the desirability of reducing his ideas "upon the best way of turning the all too short three years' course of study to the best account in mastering the abundant subject-matter of philology, into a lucid *Hodegetik*, by the help of which the future philologist, even before the sanctuary of his science opens its gates to him, may yet, while, as it were, in the outer courts of the temple, acquaint himself with its ample chambers and rich treasure-hoards." It cannot be denied that such a book might prove of use to beginners, and, apart from national and local differences, the assistance intended for the young German student might be acceptable to the English one as well. But in the aphoristic and desultory manner in which this introduction is composed, there is nothing satisfactory or complete, unless we except some matters of detail which scarcely belong to the subject, and some general hints which show a just appreciation of the task of contemporary philology. A partial analysis of the contents of the book will make this apparent.

The work is divided into five parts. Of these the first discusses the name, the conception, and the compass of philology (pp. 3-33). It begins with a review of the use of the word *φιλολογία* by the ancients, to which is appended a very cursory survey of the history of philological studies amongst them and amongst the moderns since Petrarch. There is just as little reason for the omission of the name of Zenodotus before those of Kallimachus, Eratosthenes, Aristophanes, and Aristarchus, as for the fact that amongst the literary notices the *πύλακες* are referred to in connection with Krates of Mallus, the head of the Pergamite school, and not *à propos* of the Alexandrines. It is not a historical certainty that Varro composed 74 different works (pp. 8 and 96), but only an inference from Ritschl's calculation, though, no doubt, an inference which approximates very closely to the truth, and the same may be said of the total (620) given for the number of volumes in which these works were contained; in fact, the latter statement requires qualification, as a fresh revision of the MS. catalogue of Varro's writings shows the *imagines* to have comprised only 15 instead of 51 books. The subject also of several of the last books of the *libri disciplinarum* of Varro is only determined with

approximate accuracy in Ritschl's admirable researches. But in a book destined to serve as an introduction to the temple of scientific truth, none but certain and uncontested information should be conveyed, except with the qualification of a "perhaps;" a "query (?)" in this case would have been enough, but it was also indispensable; and the same may be said of the date ("about 470 A.D.") assigned to "Marcianus," or, as it is usually written after the best authorities, Martianus, Capella. This summary, from the revival of the study by Petrarch down to F. A. Wolf, occupies little more than three pages. Of the latter, as the founder of the science of antiquity as a united whole, a more detailed account is given, and, as befits the purpose of this work, chiefly in the form of extracts from his exposition of the Science of Antiquity, from which the author's fundamental principles are derived (pp. 14-28). With disproportionate brevity, in less than two pages, and without even a reference to other sources of information, the author alludes to the modifications which the Wolfian system has undergone in the hands of Boeckh, O. Müller, and Ritschl, without making the slightest reference to the approaching publication of Boeckh's *Lectures on the Encyclopaedia of Philology*: this is followed by a similar skeleton excerpt from Fr. Haase's excellent article, "Philologie," in Ersch and Gruber's *Encyclopädie*, which is also to be reprinted shortly in the proposed edition of Haase's *Kleine Schriften*, where it will be more easily accessible to the general run of readers. The second part of the work is intended to supplement this summary view from the systematic side (the separate branches of philology, pp. 33-56), and the fifth part completes the historical side of the subject, "the masters of philological science in ancient and modern times" (pp. 89-139). As to the former, it must be acknowledged that the author assigns their just importance to the advances which have been made in the study of language; he gives due emphasis to the want of a standing-point from whence the general results of comparative philology can be embraced; he recommends the study of Sanskrit, and he refers to the Italian dialects: but here this section of the subject comes to an end. Not only is the study of the Greek dialects completely disregarded; not a word is said of the cultivation of the special grammar of the two classical languages, in the course of which discussion, besides the general philological standpoint already referred to, the importance of the historical standpoint for the study of grammar ought to have been pointed out, as would have come naturally in the author's way, since he expressly refers to the workers in the field of Roman inscriptions, and the linguistic importance of their labours. Here too we miss all reference to the corresponding researches relating to Greek inscriptions, while a special supplement (II.) actually contains some of the oldest Latin inscriptions, certainly the last place in which we should naturally look for them. Appendix I. gives an extract from F. A. Wolf's *Life of Körte* about Wolf's inscription as "studiosus philologiae" at Göttingen; III. Wolf's sketch for the proclamation of the opening of the philological seminary; IV. The most important parts of Niebuhr's well-known *Letters to a Young Philologist*; all three are more in place here than the above-mentioned second supplement. In the like sporadic, fragmentary, altogether unsystematic manner, there follows a hasty review of the remaining departments of the study, which are, according to the fancy of the moment, either superficially sketched in, or merely alluded to, or sometimes left out altogether; for instance, the author omits altogether to characterize the scientific problem to be solved by the history of literature, and dwells instead on the importance of studying the fragments and in general all the works of the classical authors.

A short sketch of Greek chronology is given, which, again, seems somewhat out of place, while that of Rome is omitted on the ground that the most important points are supposed to be already known. The recommendation not to neglect the study of archaeology commands assent, but what is said upon the subject is more than meagre. In conclusion, hermeneutics and criticism are disposed of in a couple of pages, the so-called "higher criticism" being in fact altogether left out of consideration, and, finally, though archaeological hermeneutics are noticed, archaeological criticism is not.

It would lead us too far to criticize the other two parts of the essay in as much detail as this section. The second contains (pp. 56–62) a "division of the philology student's work amongst six (half-yearly) terms." The value of this section, apart from every other consideration, must necessarily be very uncertain, because, as the author himself admits, the local circumstances of different universities must interfere with the realisation of all the practical advice he gives. Indeed, it may be doubted whether there is a single university in Germany where a student who, as the author rightly requires, extends his interest to the study of language in general, to Sanskrit, and archaeology, could go through a complete course in the time proposed. A fourth section, "the library of the philology student," is well suited to the plan and purpose of the work, giving a succinct account of the most important editions and other aids to philological study. But here too the most necessary works are sometimes omitted (as under the first heading, "Encyclopädisches," the one comprehensive *Encyclopaedia* of philology by Bernhardt is left unnoticed), obsolete ones are quoted, e.g. Moebius's edition of the fragments of Anacreon, and the Bipontine of Macrobius, whilst more recent editions are overlooked. In such a choice the subjectivity of the chooser naturally asserts its rights, but we may be prepared to allow this, and yet feel some surprise at finding only the so-called "great" Buttman mentioned amongst Greek grammarians; amongst works on the history of Roman literature, only Bernhardt and Teuffel, without Bähr or the compendious *Outline* of Hübner, which is so peculiarly adapted to the use of students attending lectures; amongst editions of Sophocles, Schneidewin-Nauck and even Wunder, but not Wolff; the Sophocles lexicon of Dindorf, and not that of Ellendt-Genthe, not the most recent corrections of the text of Euripides by Kirchhoff and Nauck, and for Aristophanes only Bergk, but not Meineke. In like manner we miss the most recently revised texts of Catullus, Pomponius Mela, Censorinus, Macrobius, of whom, as has been observed, only the Bipontine edition is mentioned; we miss the *Juvenal* of Jahn, though, besides Heinrich and Ribbek (*sic*), Ruperti and Weber are noticed; we miss the *Livy* of Madvig-Ussing, which should have been named along with Weissenborn's and my text, &c.: to say nothing of many other inaccuracies, the most laughable of which, "Magni Aurelii Cassiodori Opera, cum notis Rothomagi, 2 vols. Venet. 1729," we would willingly attribute to the printer (τριπύρρις and δκταπύρις for τριετής and δκαετής, p. 49, may perhaps be laid to his charge), were it not traceable to F. W. Wagner's *Outline of Classical Bibliography*, a careless article of which has been thoughtlessly copied. On the whole, then, the book, in its present form, in spite of some just views and some useful, if not always well-timed, information, in spite of occasional hints well worth laying to heart, yet cannot, all things considered, be characterized except as a failure. After such a precursor, we look with redoubled anxiety for the appearance of Boeckh's *Encyclopaedia*, but there would be room by the side of that for a shorter introductory outline calculated for the practical requirements of students if such a work were at once less

unequally and more solidly executed than the one addressed to Herr Freund's "young friend."

MARTIN HERZ.

**The Irish MS. of St. Gall.** [*Reliquie celtiche, raccolte da Costantino Nigra. I. Il Manoscritto irlandese di S. Gallo. Firenze; Torino; Roma.*]

THIS first part of M. Nigra's work has been got up in the best Italian fashion, and consists of 52 pages quarto, exclusive of some corrections, and four photolithographic plates illustrative of the various handwritings contained in the MS. The text of the latter comprises a little more than sixteen books of Priscian's *Latin Grammar*, copied by Irishmen some time in the course of the earlier part of the ninth century. The importance of the MS. attaches, however, not to Priscian's work, but to the numerous glosses, both marginal and interlinear, with which it is interspersed: some of these are in Latin, but the greater number in old Irish. In the introductory chapter M. Nigra discusses at length the date of the codex and other matters connected with its history, quoting, among others of its miscellaneous contents, a Latin hymn in praise of Guntarius, elected archbishop of Cologne in the year 850, as well as eight ogmic inscriptions, of which the first is in Latin. M. Nigra reads it, *feria Cai hodie*; nor is the second less Christian: it reads, *fel martain* (= *feria Martini*), erroneously deciphered by Zeuss as *fel martaen*. *A propos* of Zeuss, the foot-notes throughout teem with indications of his misreadings; the most serious of these was perhaps his having overlooked the difference between *n* and *m* in contractions.

Next come the glosses themselves and the author's notes on them. He tells us that he has only made a selection from the glosses; and it is to be regretted that he has not been able to publish them all. This part of the work seems to have been executed with his usual clearness and ability, though Irish scholars may possibly not agree with him on every point. To this we may add, that, in the course of the glosses, and his remarks on them, a good many points of considerable interest to the student of comparative philology are brought into relief. Among them we may mention the close relation between the Celtic languages and those of Italy and Greece, as shown in the word *ingen* (*crba ingen* gl. ungula), Welsh *ewin* (probably for *\*inguin*), as compared with *unguis* and *ungula*. As to the question of *c* versus *p*, it is well known that Celtic *qu* gives in Irish *c*, and *p* in Welsh, which some less accurately state by saying that Welsh changes *c* into *p*; and it is seldom kept in mind that the deviation has not always taken place on the Welsh side, though the change in Irish of *p* into *c* is demonstrated by the words *caille*, *caisc*, *clúm*, *cruimther*, *corcra*, *cuithe*, from *pallium*, *pascha*, *pluma*, *presbyter*, *purpura*, *putens*, respectively. To these data the St. Gall MS. adds (p. 34) one more item, *hi claidi* (gl. in *planta*). Page 22 offers, in the words, "*is gann in memr. et a scribend* (est difficilis membrana et ejus scriptura)," an instance of a curious borrowing from Latin, common in a few cases to Welsh and Irish; thus *scribend* is identical with Welsh *yscrifen*, both from *scribendum*; so *legendum* gives Irish *legend*, Welsh *llen*; and Irish *oifrend*, Welsh *offeren*, "mass," comes from *offerendum*. To these we may add Welsh *cystrawen*, "syntax," from *construendum*. Of special interest to Welsh philology is the author's deriving *tachtad* (gl. angens)—one of the many Celtic instances which we could wish Johannes Schmidt to have had ready to hand when he wrote his contribution *Zur Geschichte des indogermanischen Vocalismus*—from the "rad. ang. orig. AGH." On Irish ground the initial *t* is acknowledged as representing the prefix *do* in such cases: thus *do-achtad* probably became successively *\*dohachtad*, *\*d'hachtad*, *tachtad*. Now in

Welsh *tachtad* is *tag-u*, "to choke;" but hitherto the possibility of *do-* becoming *t-* in Welsh has perhaps never been thought of, though it is not very uncommon to find *dh* making *t* in Welsh—as, for example, in *parotoi*, "to prepare," from *parodhau*; *pyscota*, "to fish," from *pyscodha*, and *Betws* from old English *bedehus*, "a bead-house." On page 43 we have a still more convincing instance in *tocad* (gl. fors), as compared with *agad* (gl. fors), and with the Welsh *tyngned*, "fortune" or "destiny." It would have been satisfactory to know what the author makes of the *d*, instead of the more usual *th*, in such passive forms as *gainedar* (nascitur), p. 43; *araisedar* (annititur), p. 49; and others which occur in these glosses: in the *Gram. Celtica* such forms have been stowed away among those with *th* without any apology. Of course it may be that the old Irish, like the old Welsh, sometimes wrote *d* for *th*; on the other hand it may be that the *d* is of old standing in the words referred to. The latter view would facilitate the equation of Welsh passives with those of the Irish: thus the derivation of Welsh *genir* (nascetur) would be \**genidir*, \**genidr*, *genir*, the elision of the *d* having been effected as in *cader*, "a chair," from *cathedra*, or of *g*, as in *pererin*, "a pilgrim," from *peregrinus*. J. RHŴS.

## INDIAN MANUSCRIPTS.

## TO THE EDITOR OF THE ACADEMY.

Mangalore, S. Canara, Madras Presidency,  
September 12, 1872.

SIR,—Since I last wrote to you from Tanjore, the Government has transferred me to another part of the Presidency, South Canara. This province is interesting to a philologist, as here the Neo-Aryan and Dravidian languages meet, and the numerous dialects well deserve attention. I have no leisure for this myself, but have begun to print a series of specimens consisting of translations of Matthew xiii. verses 1-35. They will be done by natives, if possible, and will be quite trustworthy. The first (already printed) is in the southern dialect of *Kōṅkaṇī*, spoken by the Catholic Christians of S. Canara; it is by a native priest, and is in the Canarese character, and also in the modification of the Portuguese alphabet, introduced before 1600 by the Goa Jesuits. The succeeding parts will give specimens of the *Māppīla-Malayālam*, *Coorg* language, *Baḍaga* (on the Nilagiris) and other dialects as yet quite neglected. The Catholics and Muhammedans are very numerous on this coast, and I prefer their idiom to that of the Brahmans, as the latter by introducing pure Sanskrit words in great number completely destroy the character of these dialects. Each specimen will be transcribed in Lepsius' Standard Alphabet. The Basel missionaries very kindly assist, so I hope to be able to print an interesting series of these specimens.

I am seldom able to leave Mangalore, but during the Easter holidays I made an excursion with the Rev. J. Hesse to Mūdabiddri, a great Jain town in this district, and the residence of a famous *ācārya*, who received us with much civility in his convent (*maṭha*). He had sent for a Brahman, to speak Sanskrit with me, as I do not speak Canarese, and he himself (he said), being upwards of forty years of age when he became an *ācārya*, had no time to learn Sanskrit. He showed us all his MSS., about 100 in number, all old and very correct, but unfortunately written in the now almost forgotten *Hala-kaṇṇaḍa* character, and so it is necessary to train a copyist to transcribe them. My friend devoted himself to the Canarese MSS. and found nearly all the poems of Hampa, one of the oldest Jain poets who wrote in Canarese (before the eleventh century), and as yet only known by quotations; they include a *Bhārata* and a history of Rāma! I looked over the Sanskrit MSS. and found a very good and complete copy of Yaxavarman's commentary on *Çakatāyana's* grammar; also Candrasūri's *Prakriyāsangraha* to the same. The Southern Jains are *Digambaras*, and their books are almost exclusively in Sanskrit. I found, however, a very interesting MS. in Prākṛit, the *Aṭṭha-pāṇḍaka* (i.e. *prābhṛitaka*), consisting of *Gāthās* with a Hindi commentary. I find by this that the *Nirgranthas* (mentioned by the Chinese travellers) were Jains and not Brahmans. The stifling heat, however, soon compelled us to leave the *maṭha*, and we then visited the sixteen *vaṣṭis* (Jain temples) in the town. I heard that in one of these an immense number of MSS. had been walled up during

the troubles caused by the Muhammedan invasions in the last century, and had not since been taken out. The managers of the temple at first denied, but at last admitted, this report was true. I have only quite recently been able to get them to break down the wall and take the MSS. out. When this was done, more than 200 were found reduced to dust, but a number still remained uninjured. I have a list of more than 100 MSS., and among these are some treatises on *Nyāya* and grammar, and a commentary on the *Kālantra*, which appears to be by a Jain.

The managers also have sent me word that there are many other MSS. relating to the Jain and to the *Rasa* doctrine (which must be the *raseṣvara* system of the *Sarvadarśanasangraha*, p. 97, &c.), but that it was not fit that the names of these books should be written down, or the books shown to anyone except myself, and that I might see them if I would go there again. This I intend doing shortly.

The *Çṛiṅgiri-maṭha* founded by a *Çaṅkarācārya* is at a distance of a few days' journey from here, but above the ghats. Sanskritists are not aware that the great commentator on the *Vedas*, *Sāyaṇa* (more correctly *Sāyaṇṇa*), was one of the *gurus* of this *maṭha* by the name of *Vidyāranyasvāmin*. This last name occurs in the list given by Wilson (*Collected Works*, edited by Rost, i. p. 201, note), and in another list that I have recently procured he is described as "the great saint and *guru*, the founder of Vijayanagara, author of the commentary on the *Vedas* and other [books]." The present "*guru* of the world" will not show himself to Europeans, but I hope, nevertheless, to be able to find out if there are any autograph MSS. of *Sāyaṇṇa* at *Çṛiṅgiri*. It would be of much use if I could learn even what character he used to write his works. Inscriptions show that at this time only two characters were in use in the Vijayanagara kingdom: the old Canarese (which he probably used) and the Nandināgari, now peculiar to parts of Mysore.

I have lately made a discovery that the lists of *gurus* of the numerous *maṭhas* can be made the foundation of a real chronology of the later Sanskrit philosophical literature. These *maṭhas* are numerous in the South of India, but I have found that all belonging to any one sect are branches of one or two original foundations, and owe their origin to the peculiar rule of succession which is followed by the *gurus*. This rule is that there is only one *guru* at a time, and that when he supposes his death is at hand, he must appoint a successor (of course, a nephew or relation) by communicating to him the *mantra*; if, however, after doing so he recovers, the recently initiated *guru* has to leave and establish another *maṭha*. As lists of *gurus* are preserved in every *maṭha*, a comparison of these shows at once the date of the foundation, for all the lists go back to the first *guru* of the original foundation, and agree up to the date of the division. Most of the later philosophical treatises are by such *gurus*, and, as the author always mentions his predecessor's name, it is easy to find where and when he lived.

The Rev. J. Kittel has recently published a critical edition of the *Çabdamanidarpaṇa*, a Canarese grammar, of about the tenth century. The author (Keṇava) uses some technical words from the *prātiśākhya*s, and mentions many Canarese and Sanskrit works, among others a collection of Vedic roots by one Bhīma. Mr. Kittel is also much occupied with Canarese lexicography. Dr. Caldwell is engaged upon a new edition of his excellent *Comparative Grammar of the Dravidian Languages*. A. BURNELL.

## CONINGTON'S PERSIUS.

## TO THE EDITOR OF THE ACADEMY.

Harrow, October 17, 1872.

SIR,—Mr. Simcox says at the end of his review of Conington's *Persius* (*Academy*, vol. iii. p. 398), "it is to be wished that in a second edition some errors of the press may be corrected, and one or two obvious incompletenesses either supplied or removed; e.g. vi. 11, we have the following: 'Homer's revelations, however, turned on the doctrine of metempsychosis, he having been a peacock at one stage of the process (note on Prol. 3)'; where there is not a word about peacocks. Is it barely possible that Mr. Conington suspected an allusion to the fable of the daw and the peacock at Prol. 13?"

The oversight is less serious than Mr. Simcox supposes; the only error being that the note on Prol. 3 is referred to instead of that on Prol. 2, where the supposed words of Homer, "memini me fieri pavum," are quoted and illustrated. H. NETTLESHIP.

### Intelligence.

E. Osenbrüggen's edition of Cicero's speech *Pro Milone*, which originally appeared in 1841, has been revised by Dr. Hans Wirz, whose commentary may be pronounced to be the most accurate now extant on this speech. The edition in its new shape may be especially recommended to young philologists and to masters at public schools. It is published at Hamburg, by W. Mauke.

The style and diction of Apuleius have been carefully investigated in an elaborate work by Professor H. Koziol (Vienna, Gerold's Sohn). It contains the most painstaking account of African Latinity we have yet seen. We are sorry to add that from the author's investigations it appears that Dr. Eysenhardt cannot always be trusted in his collation of the Florentine MS. In the same way the edition of Ammianus Marcellinus by the same scholar has been attacked by several scholars of great authority, especially by Th. Mommsen and A. Kiessling. A new edition of this important writer is in preparation by V. Gardthausen, of which we may augur well from the dissertation containing *Coniectanea Ammianae Codice adhibito Vaticano* (Kiel, 1869) and recent papers in Fleck-eisen's *Jahrbücher*.

The first part of an edition of Cicero's *De Finibus*, with German notes by Dr. D. Böckel, has been published by Messrs. Weidmann, another edition of the same work by Dr. Holstein being advertised by Messrs. Teubner. A new edition of the *Tusculans* by Dr. Meissner (Leipzig, Richter and Harrassowitz) has also just appeared. We can only say that both paper and printing of this edition are even worse than they generally are in German books. Is it indeed impossible that German publishers should learn to get up their books decently?

Dr. E. Hiller's monograph on the fragments of the poems of Eratosthenes has just been published by Messrs. Teubner. The editor appears to be a genuine pupil of O. Jahn. He has succeeded in filling above nine sheets with discussions on three pages of fragments.

In the *Library of the Earliest Monuments of German Literature*, now publishing at Paderborn (F. Schöningh), Dr. E. Sievers has just edited Tatian's *Synopsis of the Gospels* in the Latin and the German text with an elaborate glossary.

Professor Jac. Bernays, of Bonn, has just published a German translation, with explanatory additions, of the first three books of Aristotle's *Politics*. His book may be considered both an elegant translation and an excellent commentary on the Greek original.

Professor O. Ribbeck, the editor of Virgil (against whom some of the last papers of the late Professor Conington were directed), has now left Kiel, and will this winter begin to lecture at Heidelberg.

A very interesting and important discovery has recently been made at Paris of the correspondence of a Greek called Stamaty, containing most minute and graphic accounts of the events of the French revolution, addressed to Prince Michael Soutsos of Roumania. This voluminous correspondence has been placed by General Trochu in the hands of M. Jules Loir and M. E. Legrand, who have just published a first specimen, *Documents inédits sur l'Histoire de la Révolution française* (Paris, Maisonneuve). Stamaty's letters, written in January 1793, alone fill fifty-five pages. An appendix contains letters written by other agents of Prince Soutsos at Vienna, Berlin, Warsaw, and Constantinople, which are likewise in General Trochu's possession. It is to be hoped that the whole of these interesting letters, which enable us to follow the course of events day by day, will be given to the world in a French translation. We are not particularly anxious to see the Greek originals printed, as they are written in the worst slang of the Phanári, and as these valuable documents would still remain comparatively unknown and unappreciated, were they only published in a language unintelligible to many. M. Legrand has, however, proved in the specimen now before us that he knows how to turn Stamaty's Greek into delightful French.

Professor Möbius' brochure, *Ueber die altnordische Sprache* (Halle, Buchhandlung des Waisenhauses)—originally read before the 28th Congress of Philologists at Leipzig—which treats of the history of the Scandinavian languages, their relations to each other and the Germanic languages generally, their literary monuments, and the various principles followed in editing these monuments, is of great value to all students of these languages, giving, as it does, a clear, brief, and comprehensive summary of the latest results of Scandinavian philology, and references to all the more important works (often little known out of Scandinavia) on the subject.

The last number of the *Transactions of the American Philological Association* for 1871 contains two important criticisms on Mr. Ellis' *Early English Pronunciation*. Professor March considers the evidence of the Old-English stave-rime, in which *hl, hn, hr, hw* alliterate with single *h*, and *wl, wr* with single *w*, as conclusive against Mr. Ellis' assumption of a single sound (*lh, kw, &c.*) for all these digraphs. Mr. C. A. Bristed accepts the general results of Mr. Ellis' investigations, but regards "palaeotype" as somewhat cumbrous and overdone, and criticizes many details, giving incidentally a good deal of valuable

information, especially on modern Spanish, with its remarkable dropping of final consonants. In many of his criticisms Mr. Bristed has fallen into the common error of assuming that the pronunciation of a given language is something that can be fixed absolutely, instead of being, as it really is, subject to indefinite variations. In some cases also we cannot help thinking that his phonetic analysis is either inadequate or positively incorrect.

The *Grammar of the Sindhi Language*, compared with the Sanskrit, Prakrit, and the Cognate Indian Vernaculars, by the Rev. Dr. Ernest Trumpp, has been printed by order of Her Majesty's Indian Government, who have secured the valuable services of Dr. Trumpp for the translation of the Sikh Granth.

Dr. Hermann Grassmann's *Wörterbuch zum Rig-Veda* is now rapidly passing through the press, and will consist of about fifty sheets, to be completed in eighteen months.—*Triebner's Record*.

Dr. C. Fr. Koch, the author of the *Historische Grammatik der englischen Sprache*, died of typhus, at Eisenach, on the 5th September. Dr. Koch has left rich materials, which will remain useless, as his repeated requests to be pensioned, so that he might devote his remaining years to the completion of his important labours, were not heeded.

A new classical and philological review (*Rivista di Filologia e d'Istruzione classica*) has been founded at Turin; it is conducted by MM. Pezzi and Müller, and the first two numbers seem to augur well for the revival of interest in such studies where they should certainly be most at home.

### Contents of the Journals.

Grätz's *Monatsschrift* (Jewish), August and September.—Perles' papers on Rabbinic language and antiquities (conclusion).—The 58th Psalm explained; by the editor. [Ingenious emendations.]—The Targum on the Psalms; by W. Bacher.

The Phoenix, April to August.—Linguistic articles:—Extract from a Japanese Historical Romance, in Roman letters; with translation.—Practical Lessons in Japanese; by the editor (Rev. J. Summers).—Bibliographical Notes on Chinese Books; by W. F. Mayers.—On the Aborigines of the Himalaya, with comparative vocabulary; by B. H. Hodgson.—Notes on the Chias or Ilkyens (collected in the district to the W. of the Irrawaddy), with vocabulary; by R. F. St. A. St. John.—Mongol and Turkish Vocabulary (from the great Russian work of Pallas).—The important series of papers on Buddhist Philosophy, by B. H. Hodgson, is now reprinted in full, and will soon be published separately.

Journal Asiatique, No. 72.—M. Renan's Annual Report. [A survey of Oriental literature in France, interspersed with excellent suggestions of criticism. It concludes with a warning against those "scientific Pharisees" "qui . . . n'accordent le bénéfice de la solidité qu'à la science qui s'étale avec ostentation."]

Hermes, vii. pt. 2.—C. Curtius gives a revised text of a long inscription from Sestos, with an elaborate commentary. This inscription is in the collection of Mr. Calvert, American consul at Constantinople, and has been several times edited, a copy of it having been privately circulated by Mr. Greaves in 1866. It is in honour of one Menas, and belongs to the second century B.C.—U. Willamowitz-Möllendorf has some good criticisms on twelve passages from Attic comedy.—U. Köhler (secretary to the Prussian embassy at Athens) edits two more Attic decrees, one of which is interesting as bearing upon the *δίκαι ἀπὸ συμ-βόλων*.—Th. Mommsen discusses the relation between the Vatican MS. of Ammianus and the text of Accursius (1533).—M. Haupt continues his *Conjectanea*.—H. Jordan discusses various vulgar forms and expressions found in Latin inscriptions which relate to the builder's art.—W. Dittenberger endeavours to prove a point of importance to Attic chronology, viz. the date of the "First Visit" of the Emperor Hadrian to Athens, which was adopted as an era.—R. Schöll brings a heavy charge against the good faith of M. F. Lenormant, as having forged a number of Attic funeral inscriptions. Certainly they have much in them to awaken the suspicions of one accustomed to such documents; and the learned Prof. Kumanudes, of Athens, has already expressed his doubts (*Ἀττικῆς ἐπιγραφῆς ἐπιτόμῃ*, p. 18 and 446, reviewed a short time ago in the *Academy*—vol. iii. pp. 158, 159).

### New Publications.

BENICKEN, H. K. Das elfte Lied vom Zorne des Achilleus nach Karl Lachmann aus dem 12<sup>ten</sup> Buche der Ilias. Barmen: Steinhans.  
BERLINER, A. Pletath Soferim; Beiträge zur jüd. Schriftauslegung im Mittelalter u. s. w., aus handschriftl. Quellen. Breslau: Schletter.  
LUZZATTO, S. D. Grammatik der biblisch-chaldäischen Sprache u. des Idioms des Thalmud Babli. Mit Anmerkungen von Dr. M. S. Krüger. Breslau: Schletter.  
MEUNIER, F. Études de Grammaire comparée. Paris: Maisonneuve.

### ERRATA IN No. 58.

Page 388, col. 1, line 5 from bottom, for "Houdog's" read "Houdoy's."  
,, 399, ,, 2, ,, 30, for "Tōdrōsā" read "Tōdrōsi."

# THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 60.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The Editor cannot reply to questions from authors respecting the notice of their books.*

*The next number will be published on Monday, December 2, and Advertisements should be sent in by November 27.*

## General Literature and Art.

**Translations from the Popular Literature of the Turkish Races in Siberia and the Steppes.** [*Die Sprachen der türkischen Stämme Südsibiriens und der dsungarischen Steppe.* Von Dr. W. Radloff. 1. Abtheilung. Proben der Volksliteratur. Uebersetzung. 4 Bde. (Also, with the separate title: *Proben der Volksliteratur der türkischen Stämme Südsibiriens.* Gesammelt und übersetzt von Dr. W. Radloff.)] St. Petersburg: 1866-72. Buchdruckerei der kaiserlichen Akademie der Wissenschaften.

ONE of the chief merits of the Imperial Academy of St. Petersburg is that it occasions the publication of learned works which might never see the light without its assistance, or might, at any rate, be lost to science for an indefinite time. Not to mention any other branches, our knowledge of the north of Central Asia is almost entirely due to the learned societies of Russia, and especially to this academy. The careful researches that have been made into the language and literature of the tribes of that region, which is for the most part subject to the Russian crown, were either undertaken at their suggestion or else the works bearing on the subject were published at their expense, and in many instances both was the case. Without leaving the present subject, I may instance the attractive and instructive *Heldensagen der Minussinschen Tataren*, which were collected by Castrén and Titow, done into metre by the distinguished linguist, Anton Schiefner, and published under the direction of the St. Petersburg Academy in 1859. This translation, like Radloff's work, is in German, in which, as well as in French, a considerable number of the academy's publications are composed. Schiefner's work may serve as a very welcome introduction and commentary to that part of Radloff's which deals with the epic poetry of the Turco-Tartars, though the remainder includes as well tales, legends, fables, historical ballads, songs, proverbs, in fact everything that is designated by the general term Folk-lore. As to the ground covered by the four volumes before us, I have to observe that the first two include the literary productions of those inhabitants of the Altai and the adjoining eastern districts, who still adhere to Shamanism, the Tartar tribes about Minusinsk being included under the latter head; while the third and fourth volumes contain the popular literature of those Turco-Tartar tribes which live west of the Altai, and now profess the faith of Islam, that is to say, the Kirghiz hordes together with the tribes dwelling on the river systems of the Tom, the Irtysh, and the Tobol, who are known by the general name "Siberian Tartars." While the Shamanite Tartars consist of the remnants of various tribes who live mixed together, and have quite lost the feeling of nationality, so that they call themselves either by the name of the clan

VOL. III.—NO. 60.

or after the mountains and rivers by which they live, the inhabitants of the wide Steppes (reaching from the Altai to the river Ural, from Omsk to the mountains on the northern boundary of the valley of the Serafshan, who call themselves *Kasak*, and by the Russians and other Europeans are wrongly called Kirghiz, or even Kirghiz-Kaisaki) are members of a single race, or rather nation. Of its origin little is known. Their tribal names seem to show that the Kirghiz hordes consist of the most various elements, as, for instance, the names Kypschak, Argyn, and Naiman (which is incontestably of Mongol origin); but the amalgamation in this case seems to have been completed long since, as the Chinese began to speak of the Ha-sa-ki many centuries ago. Now they certainly form a closely welded whole, exhibiting every token that belongs to national unity. As for their religion, the Mahometanism of the greater mass consists merely in external observances; thus it is strictly enjoined to cut the hair and wear a covering on the head, and it is thought proper, especially for old people, to make use of pious expressions borrowed from the Koran, yet a thorough or familiar knowledge of the faith is rare. But a strong national spirit distinguishes them from the other Turkish tribes; their manners, language, dress, and usages, are as much one as the wide steppe, with its unvarying character, which they inhabit. They themselves divide their literary productions into two classes, the words of the people and book-songs. The people's words (*Kapa céc*) are songs and narratives preserved by oral tradition, and therefore the work of that portion of the population least affected by Islam. They are only known to the unlettered, for the Moullah, that is, "he who knows how to write," looks down on them with disdain, in consequence of which they are never to be met with in writing. The book-songs are so called because the bard generally reads them out of a book instead of repeating them by heart. The same rivalry between booklearning and the mind of the people is observable amongst the Siberian Tartars, only there the latter is under the influence of the priesthood and the fanaticism it encourages. The fairy tales and ancestral legends preserved by tradition have now no place of refuge but the hearts of the aged, to whom they recall the memory of an age that has passed away, for the present generation only knows Moslem poems, of which Radloff also gives a few samples.

After acquainting ourselves with the territory occupied by the Turkish tribes of South Siberia, as well as with their general features, we may begin to consider their intellectual productions more nearly. The most characteristic of these are undoubtedly the epic poems, of which the leading features are described in Schiefner's introduction. I have already pointed out elsewhere (*Gött. gel. Anz.* 1866, pp. 1331, 1332) that these songs, in spite of much diversity, still have many elements in common with those of other nations, and the same is true of the tales, as appears from the following example:—"A poor youth, Salamja by name, possessed a fox which he had reared. The fox repaired to a neighbouring khan, and, seeking his daughter in marriage for Salamja, received a promise of consent. Thereupon he borrowed, still in his master's name, the khan's silver-weights and returned them with some pieces of silver which he had stolen sticking in a crack, and he did the same with the gold-weights, so that the khan thought his future son-in-law was very rich, and began to make preparations for the wedding. Then the fox made a ship and luggage and soldiers out of straw, and put the soldiers and the bridegroom on the ship, and made it sail toward the city of the khan; he himself hastened forward by land and persuaded the khan to come out and meet Salamja. As soon as he was in sight, the fox, who was a magician, raised a great storm and wind,

so that the ship sank with all hands, and only Salamja was washed ashore naked; so the khan gave him rich clothing in which he was married. After this Salamja set out to return to his own country, with many slaves and great riches as his wife's dowry; but the fox ran on before, and by false pretences persuaded the keepers of great herds of horses, cows, and sheep, which he met on the three following days, to tell Salamja's slaves that they belonged to him instead of to their real owner, Jilbegän with seven heads. When the fox came to the house of Jilbegän himself, he persuaded him in the same way to hide himself from Salamja's army in a well, and to let the fox cover up the mouth of the well with a heavy stone, so that when Salamja arrived he took undisturbed possession of Jilbegän's wide lands and inexhaustible treasures. But the fox went on his way." In this tale, which, like many others in the collection, is told in different ways, the reader will immediately recognise "Puss in Boots," though the cat is turned into a fox, and the boots have disappeared, a variation common to most other Western versions of the tale. This Turco-Tartar version is the only one that has yet been met with in the East, and it is remarkable that in the form of the story given in the fourth volume (not in that given in the first volume) the fox appears as the magician who can summon up winds and storms; so far as I am aware, this power is nowhere else ascribed to the fox, an animal with whom few mythological ideas are associated. The cat, on the other hand, not infrequently appears as a sorceress who conjures up storms of wind and rain (Grimm, *Deutsche Myth.* pp. 151, 282; Kelly, *Indo-European Tradition and Folk-lore*, pp. 236, 237), and one is tempted to conjecture that the latter animal originally filled the place of hero in this cycle of tales. But it would lead us too far to examine thoroughly this question, so I will content myself with pointing out the relationship of some of the other tales in the work before us to those already known; one parallel, however, must suffice in each case, as an exhaustive notice would occupy too much space. Thus "Tschälmäsch" (i. 302, No. 12) is the equivalent of "The Three Widows" in Campbell's *Popular Tales of the Western Highlands*; "Der Arme" (i. 313, No. 13) = Grimm, *Kindermärchen*, No. 19, "Der Fischer und seine Frau"; "Kosy Korpösch" (iii. 281, strophes 147-198) = Grimm, No. 136, "Der wilde Mann" (Eisenhans), to which cycle the legend of Robert le Diable also belongs, as I have shown in the *Gött. gel. Anz.* 1869, pp. 976-979; "Hämra" (iii. 518) = Grimm, No. 57, "Der goldene Vogel"; "Kosum Khan" (i. 11), "Khüzüm Khan" (*ib.* p. 139), and "Jermak" (*ib.* p. 179), three versions of the legend of Dido's Cow-hide; "Der Dieb" (iv. 193) = the legend of King Rhampsinitus' Treasury; "Der Hahn" (iv. 260) = La Fontaine's "La Laitière et le Pot au lait"; "Die Waise" (iv. 373) = Grimm, No. 126, "Ferenand getrü und Ferenand ungetrü"; "Die Almosenspenderin" (iv. 408) = Grimm, No. 31, "Das Mädchen ohne Hände." These are a few examples of those Turco-Tartar tales which are also known in Europe, though many of them are met with too in other parts of Asia; some, again, are only to be found in Oriental works, such as the Arabian Nights, Persian Tales, the Kalmuck Ssidi-kür, the Mongol Ardschi Bordschi, &c. Besides whole narratives, there are a great number of isolated traits which we have met with elsewhere, such as the scattering gold in the way of the army, to delay the pursuing enemy (i. 210—Schydar Ubang: see *Academy*, vol. iii. p. 23); the smelling blood (i. 307): "Uf, Uf, I smell the smell of men!" = "Fee, fo, fum, I smell the blood of an English man." "Die Verwandlung eines Mädchens in ein Hermelin" (ii. 201, vv. 842-845) belongs, like the preceding trait, to a widely disseminated cycle. The ermine (Lat. *Mus Ponti*, or *Mus*

*Ponticus*) is very like the weasel, for which reason the latter is called by the modern Greeks *ποντικονφίτζα*, or sometimes merely *νυφίτζα*. But the latter name is a diminutive of *νύφη* (*νύμφη*), and means accordingly young woman, maid, or little bride, and corresponds to the Italian *donnola* (dimin. of *donna*), to the German *Jungferchen*, *Fräulein*, the Bavarian *Mümelein* (little cousin), *Schönthierle* (pretty little creature), the Spanish *comadreja* (godmother), the Danish *brud* (a bride) or *den kjønne* (the fine one), and the Basque *andereigerria*, from *andrea* (woman or lass). The connection of all these epithets with a mythical origin is rendered increasingly probable by the old English and Cornish name for the weasel, "fairy," on which I have commented elsewhere. Aelian is certainly alluding to similar myths in his *Hist. Anim.* 12, 5 and 15, 11; in the latter passage particularly he says that the weasel was once a woman, skilled in magic and very licentious, whom Hecate had turned into that animal as a punishment. "Die versteckte Seele" (iv. 88) may be compared with "The Young King of Esaidh Ruadh" in Campbell's *Popular Tales*, and there are many other analogous traits which I omit.

But apart from the history of popular fiction, Radloff's work is important in other respects, as, for instance, with reference to ethnography and the history of civilisation. Thus in an Altaian tale (i. 69) a raven and a swan are sent to lead the way across the sea, which reminds us how before the use of the magnet the ancient Norsemen used to let a raven fly from their ships, to ascertain whether they were near land, by seeing whether the bird returned to the ship or not; and again of a passage in Pliny (*H. N.* 6, 24), according to which the inhabitants of Taprobane (Ceylon) used, in their voyages to India, to steer their course, not by the stars, but by the flight of the birds they took on board and then released. From another passage (iii. 13) we learn that usage forbids women under any circumstances to pass by the elder relations of their husbands, or in youth to uncover their faces before them, and they are not allowed to pronounce the name of their elder relations, and if the name chances to be the same as that of any other common object, they are not allowed to mention the latter, but have to describe it by a circumlocution; and in the same way, a newly married woman is not allowed to come towards her stepfather, nor to address him first. We see here traces of a widely spread custom, which reappears amongst the natives of other continents, to be observed by certain relations by marriage (Tylor's *Early History of Mankind*, 2nd ed. pp. 290-293). The notion which leads the Kirghiz to personify every illness, so that fever is "an old spirit" (iii. 64), which nevertheless appears in the shape of a young girl, is met with in various forms elsewhere (cf. Grimm, *Myth.* pp. 1106, 1107). On the mode of divination from the shoulder blades, especially of sheep, practised by the Kirghiz and Kalmucks, as well as elsewhere, see Tylor's *Primitive Culture*, i. 112. Grimm's *D. M.*, p. 1233, also mentions the Circassians. The Flemish settlers in Wales used the same kind of divination, which they must have brought with them from their former homes (Girald. Cambren. *Itin. Cambriae*, i. 11). It seems to have been equally well known to the Afghans, for in one of their poets we read: "When, with the mind, I examined the *shoulder-bone of prediction*, I saw that," &c. (*Selections of the Poetry of the Afghans, &c.*, by Captain H. G. Raverty; London, 1862). In a tale of the Schors (Radloff, i. 390) it is related that Ai Mögö drew the top of nine larch-trees together, and laid the bones of Kysyl-Tas there. Just so in Schiefner's *Heldensagen der Minussinschen Tataren*, p. 207: "Katai Chan, being near to death, said to his son: 'When I die, bury me not in the lap of earth, but bind the tops of

nine larch-trees together and place the coffin thereupon." An exactly similar usage prevails on Vancouver Island: "Among some tribes it is the practice to place their dead in boxes upon the branches of trees" (*Travels in British Columbia, &c.*, by Captain C. E. Barrett-Lennard; London, 1862). For the rest I have no doubt that the custom, which may very probably exist elsewhere as well, is connected with the belief, common to almost all races, that the souls of the departed like to revisit their earthly dwelling-places, so that it was natural that their bodies should be laid there after death; and these dwelling-places, we know, in the earliest times were often situated on or in trees and bushes, such as those which still form the habitations of some more or less uncivilised tribes. For a detailed discussion of this subject and the kindred superstitions relating to the residence of spirits or ghostly beings in trees and thickets, the reader can refer to my papers in the *Gött. gel. Anz.* (1864, pp. 1424, *sqq.*), and in the *Heidelb. Jahrbücher* (1866, pp. 867, *sqq.*; 1868, pp. 93, *sqq.*). Amongst the Tümenian Tartars (Radloff, iv. 441) a very singular custom formerly prevailed, and perhaps still continues, as we gather from the following historical narrative: "Once on a time a Lama was sick, and when it became evident that he was going to die, they gathered the people together and came back to the Lama; but on coming in, they found the Lama supported on one knee and one foot, though he was already dead. 'Who will throw him down?' they asked. Then said some: 'One who was born in the year of the monkey\* must throw him down.' Now it was found that the son of the Lama was born in the year of the monkey. So they said to him, 'Throw down thy father thyself;' and he did so with a stick. Then they brought the corpse into the open air, and they took off his coat and rubbed the body with mutton fat. When the fat had got cold upon it, they lighted a fire upon the body and burnt it. Then they gathered the bones together and pounded them fine like meal, out of which they kneaded dough, and of this they made images of all the beasts in the world. They fastened these images in a row upon a board, and brought the board to running water and cast it in. 'This is a great saint,' said they, and accompanied him with their thumbs thrust in their ears. Then they returned home." Besides all the rest, it is noticeable that the dead Lama was found half standing, and the question arises whether that attitude was intentionally assumed at the moment of death, and why. On this point, perhaps, a Mahometan legend of King Solomon is not irrelevant, which tells how, when his time was come to die, the angel of death led him into a room of which the walls were made of crystal. Then he prayed, and supporting himself upon a staff, he begged the angel of death to receive his soul while he remained erect. It was done accordingly, and so his death was concealed from the Djinn for a whole year, until the temple was finished; and they only discovered it when the worm-eaten staff gave way under him (Weil, *Biblische Legenden der Muselmänner*, p. 279). In an old French chronicle a somewhat similar story is told of Virgil (the sorcerer Virgilius of the middle ages), who had so arranged that for many years after his death he was believed to be only sitting on his chair absorbed in study (*Ly Myreur des Histors. Chron. de Jean d'Outremeuse*, i. 277; Acad. royale de Belgique).

I have already mentioned that various historical songs are met with amongst the Turco-Tartars, some, for instance, upon Genghis Khan, Yermak Timofeyef, the first discoverer of Siberia, &c. There is also a very elaborate satire on the Kir-

ghiz, which contains many allusions to their manners, customs, and mode of life. As a matter of course, love-songs are forthcoming, of which the following stanzas may serve as a sample. Amongst the Kysyl Tartars the girl sings: "While I live in my mother's hand, I am ever thinking of marriage; while I live in my father's hand, I think ever of going to the priest." The young man sings: "Wilt thou fly with me, O maiden? see the horse is here fastened to the gate-post; wilt thou fly with me? see the horse is standing ready." In conclusion I will quote a few of the proverbs of the Altaians and Teleutians. "Let it be thine own house, however poor; thine own groats, though the gruel be meagre" = "Home is home, be it ever so homely;" "Follow the high-road, though it winds" = "Compendium, dispendium," or, as a Cornish tale puts it: "Take care how you leave an old way to choose a new one;" "Not as reason thinks, but as God determines" = "Man proposes, God disposes;" "If the father goes wrong, the son is good for nothing; if the mother, the daughter" = "Like sire, like son." "In the heart of a woman there is a radiant mail-clad man; in the heart of a man, a fiery steed ready saddled." "He who shoots much is no shot; he who talks much is no orator;" &c. &c. Riddles, and some of them very original and characteristic ones, are also given, but I need not dwell upon these, as what I have already said will be sufficient to show the importance and interest which the work possesses in so many respects. The preface to the fourth volume does not state whether the series of literary specimens is to be regarded as already completed; in any case there is still to follow a dictionary and grammar of the different Turco-Tartar dialects, examples of which are offered by the four volumes of the original text that accompanies Radloff's translation, and gives his work a prominent linguistic value in addition to its other merits. FELIX LIEBRECHT.

Gareth and Lynette, &c. By Alfred Tennyson, D.C.L., Poet Laureate. Strahan and Co.

THE present volume, in spite of its miscellaneous title, consists of two idylls only, *Gareth and Lynette*, and *The Last Tournament*, of which we spoke when it appeared in the *Contemporary Review*.\* *Gareth and Lynette* has one peculiarity: it is the only poem of the series, except the *Passing of Arthur*, in which the story is told straightforwardly from beginning to end. Perhaps the subject is hardly fortunate; the story is in itself rather thin and hackneyed; it has no organic connection with the Arthurian cycle, into which it enters in various forms, and always in an advanced stage of decomposition. The female Cinderella is generally a victim; but her male relations, though occasionally snubbed, more commonly disguise their accomplishments for no better reason than to make people stare when the time comes to display them, unless indeed we think, as is not unlikely, that those forms of the legend are the oldest in which the hero is really foolish or effeminate till opportunity makes a man of him. In two of the minor legends of *Lancelot*, he himself as the Knight of the Cart and the Ill-shapen Knight appears as the "ironical" hero; Mallory gives us an unfinished repetition of Gareth and Lynette in *La Cotte Mal Taille* and *La Damoselle Maledisaunt*, whom Lancelot christens *La Damoselle Bien Pensaunt*, because she alleges that she only insulted her champion in order to prevent his exposing himself to danger; but this is plainly an afterthought, and she is really the sister of the ill-favoured dame whose taunts in Wolfram von Eschenbach are the principal element in the education of Parzival.

\* The monkey-year is the ninth year in the 60-year cycle of the Mongolian reckoning of time.

\* See *Academy*, vol. ii. p. 554.

The only changes Mr. Tennyson has made in the main framework of the story are that Milliscent releases her son from his disguise as scullion in Arthur's kitchen at the end of one month, instead of holding him to his promise for the conventional twelvemonth and a day, and that Lynette betrays her feelings in songs (which the interpolated insults make more incongruous and unsatisfactory than the lyrics of any of the previous idylls), and, last and not least, that Gareth marries Lynette instead of Lyonors. Nor is the obvious effort to make the humiliation of Gareth by Sir Kay and Lynette edifying particularly interesting or successful. The real charm of the poem lies partly in the unfailing richness and grace of the style (though there are unfinished phrases like these: "Kay Fell shoulder-slip;" "Through helping back the dislocated Kay;" and "Slicing a life-bubbling way Through twenty folds of twisted dragon"), and chiefly in the romantic symbolism, the picturesque mysticism which the author has "added of his wit" to a somewhat threadbare and conventional legend. The old man who meets Gareth and his companions at the gate of Camelot may be somewhat commonplace in his moralising over Arthur's vows, but the description of the gate itself is what no other poet could have written, and even the morality is redeemed by the following lines, which are in Mr. Tennyson's deepest vein:—

"For, as ye heard a music, like  
They are building still, seeing the city is built  
To music, therefore never built at all,  
And therefore built for ever."

Again the hermit's allegory of the Morning, Noon, and Evening of Life hunting the Soul of Man is not too ingenious to be frigid; and if we suppose the different fortunes of the suitors of Lyonors, who masquerade in imitation of them to typify the fortunes of the enemies who multiply upon Arthur, the parallel is hardly thrilling, but the description of Death is undeniably impressive:—

"When the Prince  
Three times had blown—after long hush—at last—  
The huge pavilion slowly yielded up,  
Thro' those black foldings, that which housed therein.  
High on a night-black horse, in night-black arms  
With white breast-bone, and barren ribs of Death,  
And crown'd with fleshless laughter—some ten steps—  
In the half light—thro' the dim dawn—advanced  
The monster, and then paused, and spoke no word.  
But Gareth spake and all indignantly,  
'Fool, for thou hast, men say, the strength of ten,  
Canst thou not trust the limbs thy God hath given,  
But must, to make the terror of thee more,  
Trick thyself out in ghastly imageries  
Of that which Life hath done with, and the clod,  
Less dull than thou, wilt hide with mantling flowers  
As if for pity?' But he spake no word;  
Which set the horror higher: a maiden swooned;  
The Lady Lyonors wrung her hands and wept,  
As doomed to be the bride of Night and Death;  
Sir Gareth's head prickled beneath his helm;  
And ev'n Sir Lancelot thro' his warm blood felt  
Ice strike, and all that mark'd him were agast."

And this solemnity gives additional value to the blithe *dénouement*, in which Death turns out to be an innocent boy, rather younger than Gareth, who accordingly proceeds with great dignity to patronise him.

Continuations are proverbially perilous, but the risk in Mr. Tennyson's case is only for his contemporaries. We read *Gareth and Lynette* after *Elaine* and *Guinevere*, and it is only natural that it should not produce the effect of a climax; our descendants, who will read it between the *Coming of Arthur* and *Enid*, will have a better chance of doing justice to what, after all, is a beautiful and delightful poem.

G. A. SIMCOX.

## NOTES ON LITERATURE AND ART.

In Westermann's *Illustrirte Monatshefte* for August there is an interesting account by von Maltzan of a "Six-fingered dynasty" which has reigned for about 150 years in South Arabia, partly by help of the unusual courage and energy displayed by the sultans and partly through the prestige which attaches through the East to persons gifted with supernumerary members, like the Philistine in 2 Sam. xxi. 20. The Fodli dynasty are of Himyaritic race, black, ugly, and in the elder branch, where purity of blood is scrupulously insisted on, six-fingered and six-toed. The sixth finger is only rudimentary, a perfectly useless stump, but highly valued as a proof of breeding, and the peculiarity is common, though not universal, amongst the remoter princes of the blood.

The birthday of Muratori (21st October, 1672) has just been celebrated in his native place of Vignola. Dr. A. Dove (*In Neuen Reich*, October 18) writes *à propos* on "Muratori's significance," hailing him as the precursor and almost the father of German historical research: the great collection of *Monumenta Germaniæ* is only a repetition of his *Annals* under, of course, changed conditions and with a clearer critical standard in view. The *Gazzetta ufficiale* contains in several numbers a study, by Professor Contini, which enumerates his works at length, and gives some interesting biographical details. A tradition says that his father was too poor to allow him to learn Latin, so he used to listen at the keyhole while the schoolmaster was giving his lessons, till he was caught in the act and allowed free entrance. He used to work twelve hours a day till he was seventy-seven, and lost his sight three months before his death. His memory was of course stupendous; but nothing can make the statement, that he composed the first nine volumes of his *Annali d'Italia* in ten months, anything but incomprehensible. He was a stern foe to mendicancy, which he is said to have banished from his parish, and he founded a charitable company bearing a very strong resemblance to the "Society for the Organization of Charitable Relief," now at work in London.

Mr. Frederick Harrison, in the *Fortnightly Review* (November), "On the Supposed Necessity of certain Metaphysical Problems," denies the existence of such problems, or at least that the same problems are always necessary. The four common problems, God, the Soul, Creation, and a Future State, do not trouble savages or the Chinese, and were not conceived by the ancient Greeks or the Hindoos in the same way as by moderns. He instances as a problem of as much interest the nature and existence of Protoplasm, and urges that no one now cares to discuss the freedom of the will or the origin of evil (cf. however Mr. Greg's *Enigmas of Life*). It might be thought that the problem of protoplasm owes its interest to the fact that it is one way of solving the problem of the soul or the nature of the vital principle.

In the *Theological Review* (October) Miss Cobbe has a paper in favour of the immortality of the soul of man.—An article in the *Quarterly Review*, attributed to the same writer, inclines to extend the same privilege to dogs.

"A Bad Five Minutes in the Alps" (*Fraser*, November) is a rather well-written description of the emotions of a nineteenth-century *Welsh* in view of approaching death; but it is rather too long, and passes into an account of the reflections common to the same character when *not* in danger of death, and these are naturally less interesting.

An association for the encouragement of Greek studies in France was founded some years ago by a pretty numerous group of men of learning, men of letters, and artists. The object of the society, which holds its meetings in the *École des Beaux-Arts*, is to support and, if possible, extend the share allotted in the ordinary liberal education (so called) to the study of Greek culture. Struck by the comparative want of interest in the *chefs-d'œuvre* of Greek art, this society has resolved to add to the critical and philosophical dissertations which it now publishes in its transactions the reproduction of such consider-

able works of Greek art as have not yet been made public. These reproductions are printed separately in quarto, with accompanying explanatory text, and are published in numbers, under the title of *Monuments grecs*. This year's subject is a Greek vase, of singular size and beauty, recently acquired by the department for antiquities of the Louvre Museum. On the inside the design represents Theseus borne by Triton into the deep, and receiving, in the presence of Minerva, a crown from the hands of Amphitrite. The reverse represents four labours of the same hero. The style is still archaic, but large and full of charm. The vase is signed Euphronios. The reproduction has been drawn and engraved by M. Sulpis; the archaeological commentary is by M. de Witte.

A short time back a portrait of the Marchese di Mirabella, attributed to Van Dyck, was sent to the Pinakothek at Munich from Schleissheim. The attribution was much discussed at the time, but in spite of adverse criticism, Dr. Wilhelm Schmidt steadily maintained its correctness. He has lately contributed to the *Allgemeine Zeitung* a short notice of the painting in question, and of the grounds for believing it to be a genuine work by Van Dyck. Dr. Schmidt does not forget the portrait of the same nobleman, also attributed to the same painter, which is in the possession of the Earl of Warwick. The Munich picture is considerably the larger of the two, which looks in favour of its authenticity. Waagen noticed in the Warwick Castle example a "golden tone," from which he suspected it to have been painted by Van Dyck at Venice, under the influence of Titian. But this is not very striking; and except for the unusual care of finish, Lord Warwick's fine picture has no smack of the copy about it. Perhaps it is a repetition?

The casts from the antique in the Berlin Museum are arranged according to subject. This arrangement, which forms a special exception to the chronological method which is strictly followed in the other departments, has been attacked by Professor Conze in the last number of the *Preussische Jahrbücher*. Professor Conze's article has drawn forth a reply from Dr. Bötticher, who is the person responsible for this state of things. Professor Conze justly maintains that the whole question of scientific arrangement for the purposes of scientific study is here at stake. To which Bötticher has some difficulty in replying. The arguments by which he supports his position amount in the rough to this—the chronology of ancient sculpture is as yet very uncertain, and there are many points still in dispute amongst archaeologists themselves; therefore to attempt historical arrangement would be to keep the collection in a perpetual state of disturbance. This defence, which is manifestly a very weak one, has been efficiently criticized by Reinhard Ketulé in *Im Neuen Reich* (October). Archaeologists do not require a complete order carried out in every small detail, for that would be to demand the impossible. What they ask for is an arrangement which shall take account of the assured results of historical research. And as far as concerns the relative grouping of the principal epochs of ancient sculpture, a great deal more has been exactly ascertained than Dr. Bötticher (who touches here on a province not familiar to him) appears to be aware of.

The town of Brussels has acquired the fine collection of drawings sold this year at Ghent representing the details of the ceremony of the inauguration of the Emperor Charles VI. as Duke of Brabant in 1715. The drawings are executed by the court architect Bourscheidt. The town has also purchased the original design for the pulpit of the church of SS. Michel and Gudule; a photographic reproduction of the Grimani breviary; and an example of the magnificent medal struck in 1708, to commemorate the raising of the siege of Brussels by the French-Spanish army.

The approaching publication of a work by M. Émile Ollivier has been announced, entitled, *Une Visite à la Chapelle des Médicis: dialogue sur Michel-Ange et Raphaël*.

The well-known collection of works of art possessed by M. Mancel, formerly a bookseller and publisher at Caen, has been by him bequeathed to the town of Caen, subject to the

fulfilment of certain rather onerous conditions. If Caen declines the bequest, it is to be offered, still on the same terms, to Rouen; should both Rouen and Caen refuse, the collection falls to the State. The books to be deposited in the National Library; the engravings in the print-room of the same establishment; the paintings and drawings in the galleries of the Louvre; the other works of art in the Cluny Museum. M. Mancel was the purchaser of the whole collection of engravings, amounting to 50,000 in number, left by Cardinal Fesch.

Dr. Messmer contributes to the *Allgemeine Zeitung* for October 28 a useful little review of the literature of Christian art. He begins with a string of brief notices of recent works—Lübke's *Deutsche Renaissance*; Dr. Franz Kraus' *Die christliche Kunst in ihren frühesten Anfängen*; Desbassyns de Richemont's *Études sur les Catacombes romaines*; Neumann's *Drei Dombaumeister Roritzer*; Bucher's *Die Kunst im Handwerk*; *Quellenschriften für Kunstgeschichte und Kunsttechnik*; Hotho's *Geschichte der christlichen Malerei bis zum Ende des 15. Jahrhunderts*; &c. To these he appends a short review of the principal books published in Italy, France, Germany, and England, since Vasari in 1550 inaugurated this branch of research. As might be anticipated, the German list is by far the most complete, the English list is very poor, and there are considerable omissions in the French.

A "Black and White" exhibition is to be held at New York the beginning of next year, and contributions are invited from the artists of all countries. The details of the conditions and arrangement have not as yet been made public.

Many new particulars of the life of Overbeck are contained in *Brevi Notizie intorno alla Vita e alle Opere di Giov. Federico Overbeck* (Naples). The pamphlet in question is the work of Giulio Borgia Mandolini, who has taken much pains to gather together information from those best qualified to give it. Overbeck's last work, the designs for the "Seven Sacraments," still remains unsold in Rome. A correspondent of the *Allgemeine Zeitung* pronounces them to be, in his opinion, the most beautiful and perfect of all Overbeck's works, and expresses the hope that Germany will not allow them to be carried off by any other country. The same correspondent, who writes from Rome, announces that the famous Villa Albani, now called Torlonia, is to be sold, together with all the works of art which it contains, amongst which an important painting of Perugino's, and Giulio Romano's designs for the "Marriage of Cupid and Psyche," completely carried out in oil, are mentioned.

The *Gazette des Beaux-Arts* for September 1 commences with an interesting contribution to Raphael literature from the pen of the Marquis Giuseppe Campori. The archives of Mantua have furnished many important documents to the historians of Raphael, but their treasures are not yet exhausted. Two letters of Elizabeth Gonzaga, wife of the Duke of Urbino, now published by the marquis, contain curious indications of two works by the hand of Giovanni Santi, which are now supposed to have perished. A letter of Stazio Gadio, the agent at Rome of the Marquis of Mantua, has also been brought to light, which furnishes proof of the existence of a portrait by Raphael of Frederick, the young son of the marquis, detained in Rome by Julius II. as a hostage for his father's loyalty. The existence of such a work had been suspected by Passavant and others, but never proved. The Marquis Campori gives us the agent's letter recounting how Frederick was dressed for the sitting, "armé avec un sayon de V. Exc." &c. The article contains a great variety of similar new details, some of which may prove to be of consequence to future investigators.—M. Lechevallier-Chevignard notices "Quelques Portraits de Henri IV"; and at p. 371, l. 22, we find a misprint: "Brunel le peintre de la petite galerie," &c., should be "Bunel." The person in question is evidently Bunel, a Huguenot artist, who, employed at the Escorial by Philip II., was called to Paris by Henri IV. to work under Dubreuil at the interior decoration of the Louvre.—M. Havard has a third article on the Amsterdam exhibition.—M. Lecoy de la Marche concludes his publication of the letters of the directors of the Academy of France at Rome.—M. Ménard

contributes the remaining portion of his valuable and suggestive paper on the Symbolism of Desire.—M. Champfleury writes a notice of the Ceramic of the north of France, *à propos* of the Retrospective Exhibition at Valenciennes.—The illustrations to M. Ménard's paper are very choice, and the number contains an excellent etching by Veyrassat from his painting of "A Village Smithy."

The *Allgemeine Zeitung* for October 8 contains a report as to the present state of the Loggie of the Vatican, which is very satisfactory, especially as regards the restorations which were completed in 1870 by Mantovani and Consoni. The writer states that Signor Consoni, to whom the reparation of the subject frescoes was entrusted, has in no case painted over even a trace of original work; he has confined himself wholly to filling in destroyed places. In another letter the same correspondent speaks enthusiastically of the success of Signor Botti's (of Pisa) method of restoring faded frescoes. The undertaking of transferring the frescoes of the Campo Santo from the wall to canvas has been committed to his care, and his first successful attempts have been made on some by Benozzo Gozzoli. He refixes the fresco in its place by means of a liquid—the composition of which he keeps secret, as he does also the ingredients of the wash by which he refreshes the colours. The method would seem to resemble that of Abbate Malvezzi (see *Academy*, vol. ii. p. 558), which has been recognised by the Academy of Milan and employed on the frescoes of Gaudenzio Ferrari at Varallo with great success. Signor Botti has, it is said, also restored, satisfactorily, "The Last Judgment," by Giotto, and several of his minor works in the Scrovegni chapel at Padua. Regarding this last-mentioned chapel, we learn from another source (*Kölnische Zeitung*) that the long pending litigation concerning it between the government and Count Gradenigo has at last terminated in favour of the latter. The government had claimed it as church property under the law of confiscation.

A correspondent writes to us to mention, in connection with Mr. Colvin's article on the *Hyperotomachia* (October 15), the fact that, in addition to the notices there cited, the book is mentioned slightly by D'Israeli in his chapter on "Literary Follies" in the *Curiosities of Literature*. He sees nothing in it but an inflated love-tale and "amatorial meditations."

We understand that Dr. C. M. Ingleby has at press a work entitled *Shakespeare's Prayse Sung by the Poets of a Centurie*, being a complete catena of song allusions to our great bard.

### Theology.

**History of Jesus.** [*Geschichte Jesu von Nazara in ihrer Verkettung mit dem Gesamtleben seines Volkes, frei untersucht und ausführlich erzählt von Dr. Theodor Keim.* Vol. II. Part II. : Das galiläische Lehrjahr. 1871. Vol. III. : Parts I. and II. : Das jerusalemische Todesostern. 1871 and 1872.] Zürich : Orell, Füssli, and Co.

[THIRD NOTICE.]

THE completion of a work of such magnitude and importance as Dr. Keim's is a matter for most sincere congratulation. The courage to plan and undertake such a work is not often found; and when it is, the author will feel it as part at least of his reward that he should have been permitted to bring it to so happy a conclusion. Let critics differ as they may upon the value either of particular conclusions or of the total result of Dr. Keim's work, there can be no doubt that he has added a new classic to the library of theology.

There are many who would say that the task which Dr. Keim has set for himself was condemned to failure from the outset. They would content themselves with repeating a sentence quoted by Mr. M. Arnold *à propos* of recent attempts to recast the Gospel history generally: "Quiconque s'imaginer la pouvoir mieux écrire ne l'entend pas." But Dr. Keim has virtually escaped the danger of such an attempt. When we say that his book amounts (at a rough guess) to about fifteen times the bulk of the Gospels themselves, we think we shall have said enough to show that it is not intended to enter into competition with them as a biography. It is rather an introduction, on the largest and most complete scale, to the study of the Gospels, or an encyclopaedia, biographically arranged, of the Gospel history.

Regarding it in this light, and looking back over the whole work as now complete, we may say that it contains: (i.) a criticism of the documents; (ii.) a criticism of the history; (iii.) a construction of dogma or philosophy founded upon these.

(i.) It is chiefly into the second and third of these parts that Dr. Keim has thrown his strength. And though the ability which characterizes the whole work comes out also in the preliminary treatment of the documents, still we think that this is the part in which Dr. Keim will be thought to have been comparatively least successful. His scepticism as to the result of previous enquiries perhaps may be justified; but the documentary criticism of the Gospels is too large a subject, and needs too special and detailed investigation of its own, to be incorporated merely as a branch in a book of historical criticism. We have said enough, perhaps, upon this part of the work already (*Academy*, vol. ii. p. 352.)

(ii.) But much of the peculiar thoroughness of Dr. Keim's treatment consists in this, that he does not let himself be carried away by any single hypothesis. He regards each single question as it arises from every possible point of view; and if we think there is traceable a certain prejudice arising from an undue preference for the first Gospel, and an undue suspicion of the fourth, still this will be found to detract less from the value of the enquiry than might be supposed. The statements of the fourth Gospel are discussed as ably and as fully as those of the Synoptists; and even where we feel disposed to differ from Dr. Keim, it is impossible to deny that he has fairly argued his case. Indeed, it is but justice to say that from first to last nothing of importance has been omitted.

Dr. Keim pursues, in regard to miracles, the principles which had been laid down in the earlier part of his work (see *Academy*, vol. ii. p. 353). The earlier storm at sea seems to him to contain a kernel of historical fact, with

colours added from Psalms cvi. and cvii. and the passage of the Red Sea. The second storm, with the walking upon the water, is more decidedly unhistorical, though it has perhaps grown out of some actual saying, and typifies the helplessness and deliverance of the Church. The record of the miracle which precedes this last (the feeding of the 5000) has its ground in a distorted version of the precept, "Give to him that asketh of thee." The multitude is fed with spiritual food, and in their enthusiasm the pilgrims on their way to the Passover divide their own scanty provision among their hungry neighbours. There is also, Dr. Keim thinks, an admixture of Old Testament elements derived from the feeding of Elijah (2 Kings iv. 42) and that of the Israelites in the wilderness (Ex. xvi. 1, ff.). The raising of the widow's son at Nain is a legendary construction on the model of Elijah's miracle upon the son of the widow of Sarepta. The miracle at Bethany is explained partly out of the exigencies of the Johannan narrative, partly as an ideal or allegorical representation of the work to which it forms the concluding scene.

It will not be expected that we should enter into the discussion of these theories. This remark, however, we must make, that in spite of the care and elaboration which are bestowed upon them they rest in secondary degree upon documentary criticism. Dr. Keim does not seem to assign a constant value to his documents. Why, for instance, should the history of the issue of blood and of Jairus' daughter be accepted almost as they stand, while that of the feeding of the 5000 and of the storm at sea is resolved practically into a myth? Obviously the reason is *a priori*: because the one admits of being rationalised, and the other does not. Yet both are clearly from the same document—a document to which Dr. Keim himself allows a high value (vol. ii. pp. 490, 495). And the great difficulty, as it seems to us, in the way of any attempt at the wholesale elimination of the miraculous from the Gospels is, that a different and unequal measure has to be applied to portions of the record that possess the same documentary value. The record of the miracles derives a reflected authority from that of the discourses; and the originality and accuracy of the discourses are vouched for, not only by their form, but also by a singular convergence and unity of testimony running through the whole of the documents and traditions embodied in our present Gospels. It will be noticed that one at least of the instances which we took as crucial in our earlier article (the Syro-Phoenician woman; see *Academy*, vol. ii. p. 353) is treated by Dr. Keim with singularly disproportionate brevity; as a miracle, indeed, it is hardly treated at all. Dr. Keim himself takes, as a crucial instance, the healing of the Gadarene demoniacs. And we may remark by the way that the passage in which this is done (vol. ii. p. 464) would have lost nothing in force if it had been expressed with a little more delicacy. It is one of the blots upon this noble work that it errs too often on the side of a coarse and ungainly rhetoric, which is apt to repel the reader from doing full justice to its real ability, and which is particularly unfortunate in dealing with such a subject.

Two characteristic instances of Dr. Keim's mode of treatment occur in the later portion of the work. As to the day and date of the Crucifixion, Dr. Keim, as we may suppose, naturally follows the Synoptists. He fixes upon Nisan 15th (= with a little straining of the astronomical premises April 15th), in the year 36. This is not however done by ignoring the difficulties which stand in the way. Dr. Keim treats very fairly and with great archaeological knowledge the argument (which is now, however, seldom pressed) from the improbability of a criminal process and execution taking place on the "great day of the feast." He thinks that there

was a kind of "stormy zealot rising" in which the forms of law were set at nought, and that the Crucifixion itself had in the eyes of its authors a certain expiatory religious character. He admits the attractiveness and seeming advantages of the Johannan narrative, but he refuses to quit the ground which seems to be established by the coincidence of the forms of the Last Supper with those of the Paschal Meal. Perhaps he is right in so doing, but this does not remove, it only suppresses, the strong case which had just been admitted in favour of St. John; and the question may fairly be raised whether our ignorance does not leave room for a reconciliation of both narratives which should not be inconsistent with the substantial authenticity of each of them separately. With regard to the date 35 A.D., Dr. Keim reiterates the arguments of his introductory volume, but we do not think adds very much to their strength. He rests his case mainly on the necessity for the "closest possible juxtaposition of the death of John the Baptist and the defeat of Herod by Aretas" (vol. iii. p. 498, n. 4). But the assumption, that in order to be regarded as a "judgment" this disaster must necessarily have happened immediately after the crime, has no great force in itself, and appears to be contradicted by Old Testament examples: e.g. 1 Kings xxi. 19, xxii. 38, compared with xxii. 1 (the death of Ahab), 2 Kings ix. 36 (that of Jezebel), 2 Sam. xvi. 21 (the punishment of David). We have called attention to the arguments which seem to make for a different date. It is to us incredible that John ii. 20 should be merely a calculation based upon Luke iii. 1 (vol. iii. p. 497, n. 2).

The questions arising out of the narratives of the Resurrection are treated by Dr. Keim at length. He tries—and succeeds to an extent which speaks well for his honesty of purpose—to hold the balance between the traditional or literal theory and that which resolves the several appearances into "visions." The old Rationalistic alternative of "simulated death" is mentioned only to be dismissed. Taking his stand not so much upon the four Gospels as upon 1 Cor. x., Dr. Keim (like Baur) considers it proved that the Resurrection, if not a fact, was at least believed to be one by the disciples. But the hypothesis of "visions" he cannot accept without reserve. He points to the difference between the earlier appearances and the later, such as those to St. Paul. In the former there is a strange simplicity and seriousness, a certain severity of character, which seem to mark them off from the ordinary products of religious excitement. The difficulty in regard to them, Dr. Keim thinks, is less that they should begin than that they should cease as and when they did. The visions of Montanism lasted over a period of fifty years, and ceased gradually, not abruptly like those in the Gospels. But the most important point is that the vision-hypothesis seems inadequate to account for the great mental and moral revolution wrought in the disciples. It moves in a vicious circle. The revulsion of feeling might perhaps account for the visions; but then how are we to account for the revulsion of feeling? If we are to follow the documents—and if we are not to follow them, how did they come to contain anything so paradoxical?—the disciples were not only not prepared for the Resurrection, but were surprised by it and incredulous of it. Dr. Keim accordingly leaves a certain margin beyond the vision-hypothesis, to be filled perhaps by direct divine agency or by real objective spiritual impressions materialised in the reports into the grosser shape of visions. The vision-hypothesis would make the whole subjective. Dr. Keim would go so far in the direction of the traditional view as to say that there was an objective supernatural cause at work as well; but he regards this cause as incorporeal, and working only in the domain of spirit.

Here the orthodox and the critical theory almost join hands; because it is inherent in the circumstances of the case that the narrative should be coloured by subjective beliefs and impressions, and on the other hand, when once a supernatural element is admitted, the extent of it will remain an unknown quantity.

(iii.) The last forty-six pages of the book are taken up with a dogmatic estimate of Christianity and its Author. Dr. Keim accepts fully the view of those who from Goethe and Hegel to Strauss have seen in Christianity the "absolute" or perfect religion. He speaks eloquently of the perfect balance which it maintains "between philosophy and popularity, between religion and morality, between meek submissiveness and the pride of freedom, between the ideal and the real, between this world and the next, between the inward and the outward (*Innerlichkeit und Gestaltungstrieb*—an untranslatable but expressive phrase), between 'modest stillness' and heroic courage, nay, between the tenderest conservatism and the boldest plans of world-wide reform."

And yet Dr. Keim regards the Personality from which this religion took its rise as strictly human. His premises compel him to do so. And thus he is led to reject, not only the greater half of the Pauline and Johannean theology, but also to cut a line through the Synoptic Gospels themselves, which we venture to say would not be given by an investigation that was purely historical. In the last resort the principles to which Dr. Keim appeals are *à priori*. And this is the one part of his method to which we feel compelled to take exception. If the supernatural is excluded on *à priori* grounds, *i.e.* by philosophy, we may expect that it will also be excluded on *à posteriori* grounds, *i.e.* by documentary and critical investigation. But it is unfair to beg the question and make use of the assumption to determine the direction that such documentary and critical investigation shall take. The two methods should be kept distinct; and we should be quite sure of the result obtained by one or other of them before we allow it to dictate laws out of its proper sphere. Such an abstraction of mind however is difficult—perhaps unattainable—and in default of it we must needs welcome an *ex parte* statement so able, so honest, and so thorough as this of Dr. Keim's, and trust to the collision of opposite opinions to get at the truth as a sort of resultant between them.

We are very glad to see that the *Geschichte Jesu von Nazara* is down for translation in the new series announced by Messrs. Williams and Norgate. We would venture to suggest to the translator that the style will bear to be toned down a degree or two in English. If it has not the wonderful evanescent grace of M. Renan, or the polished incisiveness and dexterity of Sir R. Hanson, it is still bold, vigorous, picturesque, clear, and very varied in expression. The translator has a difficult and laborious task before him, and we heartily wish him success.

W. SANDAY.

**The Desert of the Exodus: Journeys on Foot in the Wilderness of the Forty Years' Wanderings**, undertaken in connection with the Ordnance Survey of Sinai and the Palestine Exploration Fund. By E. H. Palmer, M.A., Fellow of St. John's College, Cambridge. With maps and numerous illustrations, &c. Two parts. Cambridge and London: 1871.

MR. PALMER gives us here a description of two expeditions, which occupied the winters of 1868-69 and 1869-70. Both were "journeys on foot," and accompanied with the privations and perils incident to travel in the desert, and which only a thirst for knowledge could render tolerable. Their object, in short, was to ascertain whether the Bible account of the route of the Israelites was in harmony with

geographical facts and the nomenclature still in use among the Arabs. Mr. Palmer's special qualifications were familiarity with the spoken Arabic, and a singularly circumspect method of eliciting correct information from the natives.

The most important results are that the route of the Israelites must have lain through Wady Feirân to Sinai; that the scene of the legislation is not Mount Serbâl (this is quite certain from the description of its site and environs), but the more elevated ridge whose southern part is called Jebel Mûsa; further, that the important station Hageroth can still be recognised in the present 'Ain Hudherah, in the Sinai mountains; and, lastly, the site of the much tried Kadesh is pointed out with absolute certainty in 'Ain Gadish (so spoken and written, instead of Qadish or Kadish).

The difficult station Rephidim, the last before the wilderness of Sinai, is placed by Mr. Palmer, with Lepsius, in Wady Feirân. This view must be rejected, in spite of the Arabic tradition brought to light in the present work. For according to Ex. xvii. 6, the water called for by the people in Rephidim was smitten by Moses from the rock "there . . . in Horeb." But anyone who, like Mr. Palmer, rejects Lepsius' view, that Horeb-Sinai is in Serbâl near Wady Feirân, cannot, without unduly extending the name of Horeb, transfer the position of Rephidim to that region. Mr. Palmer indicates as the traditionary spot the rock *Hesy el Khattâtin*, which he neither translates nor writes in Arabic, so that only the first word is recognisable. According to Freytag's lexicon, *hesy* is "puteus in arena effossus, cujus fundus haud remotus est"; according to that of Lane, "water which the earth imbibes, where sand is above it," not a very suitable epithet for a rock-spring, much less for the rock itself. Mr. Palmer's answer to the other objection, that from Rephidim to the wilderness of Sinai is only one day's journey according to the Bible, whereas the real distance is much greater, is that the night may be supposed to have been added to the day's journey, according to the modern practice, and that Moses, when arrived on the pass between both valleys, may have looked out for a place to encamp in. The Bible, however, simply says, "and they came to the desert of Sinai" (Ex. xix. 2). One of the principal reasons for throwing the plain of Rephidim so far back is that, in opposition to the traditionary view, the scene of the legislation is placed on the front or northern point of the ridge of Horeb-Sinai, *i.e.* on the rock Sufsafeh. (This spot was also selected by Robinson and Lepsius on purely topographical grounds, because the plain er-Raha, the largest in the district, stretches immediately before it.) If, however, the general tradition be correct, the gathering-places of the people (*i.e.* a large part of the men, who alone belonged to the "congregation," and the elders of the people) must have been in the plain Seba'i'yeh, which rises like an amphitheatre to the south of Jebel Mûsa.

Mr. Palmer's principal objection to this view is (part i. chap. vii.) that (Ex. xix. 23) bounds were ordered to be set round the mount, and he observes that it would be "simply impossible" to do this, "or even to come close up to the foot of Jebel Mûsa from Wady Seba'i'yeh." But, in the first place, the phrase "round about" in Ex. xix. 12 is confined to the people; the mountain is simply to be bounded, verse 23 (see Hebrew), which would be effected by a partition on the side facing the people. And in the second, the implied possibility of touching the mount (Ex. xix. 12) corresponds to the observations of many other travellers, since Jebel Mûsa descends by a precipice about 2000 feet deep into the plain of Seba'i'yeh, as Mr. Palmer in part i. chap. vi. himself admits. Besides, we are not to suppose an enclosure of stakes, for there is no wood, nor ever was there any, in the upper part of Sinai, but a line of stones between the

people and the mount, not insurmountable by nature, but by the threatened penalty of death for disobedience (Ex. xix. 12). Mr. Palmer, too, has recognised that the plain before the mount could only have embraced a part of the people with the elders, the remainder—old men, women, and children—encamping in the wadys of the neighbourhood. But in that case the number of those who found room is not important to the argument, and the claims of Jebel Músa are supported by its considerably greater height, and the universality of the Mohammedan as well as of the long Christian tradition. And it is not clear why this well-attested tradition of centuries should be sacrificed to the beautiful prospect from Sufsafeh and the belief of the Arabs, first discovered by Mr. Palmer, that the rock at Horeb out of which Moses brought water in Rephidim still exists in Wady Feirân. We ought also to consider the great difficulty of ascending the rock Sufsafeh, whereas there are several easier paths leading up Jebel Músa; especially as Moses was then at least eighty years old, and climbed the mount several times in the day.

The identification of Haseiroth, the second station of the Israelites between Sinai and Haran, with 'Ain Hudherah, found by Mr. Palmer north-east of Sinai, is new and, I think, probable, as name and distance are about the same as in the book of Numbers. A new conjecture, which deserves further examination, is also proposed for the first station, Kibroth hattaabah ("graves of lust"). Mr. Palmer proposes to identify it with the old camp-ground now called Erweiz el-Ebeirig (the name is not explained, nor yet written in Arabic). This spot is said to have many graves, and to be a day's journey to the rear of 'Ain Hudherah; how far it is from Sinai is not stated—according to Num. x. 33 there were three days' journeys, which is perhaps too much. Of the following stations in Num. xxxiii., Rissah (verse 22), Haradah (verse 24), and Tahath (verse 26) are identified, the latter with a place Ettehl. The comparison of the Biblical Haradah (written with *khâth*) with Jebel 'Aradeh is improbable, partly because the first sound of this name is quite different (it is an 'Ain), partly because Jebel 'Aradeh is not far enough to the north of Hudherah to allow space for the six Biblical stations between those two places.

It is to be regretted that the travellers did not take the north-east direction towards Eziongeber (Akabah), on leaving Haseiroth and the southern edge of the wilderness of Paran. For this was the route of the Israelites (Num. xiii. 1, xxxiii. 18, foll.), who are recorded to have made ten stations between Haradah and Eziongeber, many of which, as Mr. Palmer himself conjectures, might still be traced. Instead of this, the travellers turned straight northwards through the whole south part of et-Tîh, passing by the fortress Nakhl (scarcely a reminiscence of the first part of Nakhal-Misraim, although the place lies by the Wady el-'Arish) in the direction of Kadesh.

It is one great merit of Mr. Palmer to have fixed the disputed position of Kadesh or Kadesh Barnea, the most southern frontier town of Palestine. It is the 'Ain Kadesh (Mr. Palmer gives as the present pronunciation 'Ain Gadish) mentioned, but not visited, by Rowlands, and situated a little to the south of the well-known Guderat (Kudeirât). The town of Kadesh must have been near a fountain, for the name in the Old Testament is interchanged with 'En-mishpat ("fountain of judgment"). Water enough is shown to exist at 'Ain Gadish, and a large plain bounded by fine mountains, viz. the desert of Kadesh, of which a beautiful view is given. The new name Gadish is phonetically identical with the old, since the Arabs of Egypt and, according to the present work, those of Sinai and Arabia Petraea, have replaced the hardest *k* of the Semites (Heb. *qof*) by a guttural *g*, so that

*shagg* or *shakk* becomes *shagg* ("crevice," "cleft"); *kusûr*, *gusûr* ("castle"); *kaṭaf*, *gaṭaf* (a herb used for fodder), and *nakk*, *nagb* ("a mountain-pass").

Among the cities of the south, Sēphât (the Zephath of the English Bible does not represent the Hebrew) was placed by Robinson at the pass of Šafâh. If this is thought to lie too much to the east, it must be remembered that the name exactly agrees with that in the Bible, while the modern Sebaita (Rowland's Sepâta), adopted by Mr. Palmer, has much too distant a resemblance to it.\* Rehoboth had been already identified with Ruhaibe. But the combination of Shutneh with Siṭnah is new and satisfactory.

Mr. Palmer found the ruins of Beer-sheba' (Arabic Bîr es-Seb'a) in such a dilapidated state that it was impossible to form an idea even of the houses of the town, much less of its streets and walls. Like Robinson, he saw two wells, besides a third which had fallen into decay. Traces were also pointed out of four others, which are most likely productions of Arab fancy, for the existence of seven wells was long ago inferred from the second part of the Arabic form of the name (*seb'a* = seven). The meaning "oath," however, (Gen. xxi. 31; LXX. *φρέαρ ὀρκισμοῦ*), though antiquated in the literary Hebrew, and of course unknown to the Arabs, is sufficiently established by the two Hebrew names Ell-sheba' and Bath-sheba' (not "daughter of seven," but "daughter of the oath"), and puts out of court the vague Arab tradition related by Mr. Palmer.

Eshkol, whence the Hebrew spies brought clusters of grapes, pomegranates, and figs to Kadesh, has generally been placed in the immediate neighbourhood of Hebron, on account of the vineyards which still flourish there. Mr. Palmer, however, places it much farther south, for the excellent reason that the fruits, particularly the figs, could not have been brought such a great distance fresh and without injury. The name indeed has not been discovered, but its meaning (Nakhal Eshkol = "wady of grape clusters") was of some use as an indication. Mr. Palmer places it not far to the north of Kadesh in Wady Hanein, which, after passing by el-Birein, meets Wady Abyadh, which further on unites with Wady el-'Arish. It is true that agriculture is at an end there, but there are still traces of its former existence, particularly of the cultivation of the vine. These consist of heaps or walls of stone extending in parallel rows, between which vines must have been once trained, for they bear the name *tulcildt el-'enab* ("hills of grape-clusters") and at a short distance off, near the ruins of 'Abdeh, which will be mentioned directly, they are called *rujûm el-kurûm* ("stone-heaps of the vineyards").

On their return journey from Hebron, after a short visit to Jerusalem, the travellers took a more easterly direction through the mountains of Judah by Tell 'Arâd and Elmilh to the south. They traversed the mountainous district of Rakhmeh, in which Mr. Palmer not unreasonably suspects the *נֶבֶל הַיְרֵחוֹ* (1 Sam. xxvii. 10), comparing the rejection of the Ye- in the modern Rîha for Yeriho; to which may be added Zerîl (for Zerîl) for the ancient Yizreel, and in Hebrew Bil'am and Yible'am, Qabseel and Yeqabseel, Conyahu and Yechonyahu. In the same connection, a thorough account is given of the various parts of the Negeb or "south country" which occur in the Old Testament.

The road to Edom, described in one of the last sections of the book, led through the mountainous country of the

\* Cf. Mr. Palmer's letter in the *Athenæum*, June 17, 1871, where he observes that, in his opinion, "the two words are as identical as they can well be; the Hebrew (Judges i. 17) being *נֶבֶל*, and the Arabic, according to the pronunciation of the Teyshah and 'Azâimeh Bedawîn, being *نبل*."—E.D.

'Azázimeh Arabs, south-east of Beer-sheba' and north-east of Kadesh, a region which is now for the first time explored and fully described. The only material results, however, for the geography of the Holy Land are that an old road from Gaza to Petra and 'Akabah led through those mountains, and that the Roman station of Eboda (according to the Tabula Peutingeriana) has been shown with certainty in the ruins of the modern 'Abdeh, on a hill at the entrance of Wady Marrah, and another called Gypsaria in Wady Gamr, near the valley of el-'Arabah. Mr. Palmer rightly considers the oldest inhabitants of this region to be the Canaanitish 'Avím, who, according to Deut. ii. 23, with which Josh. xiii. 3 agrees, lived in *hašerim*, i. e. "encampments," or "stone-huts." A number of stone-walls, which served for encampments, were found not only in these parts, but in the more southerly deserts inhabited by the Amalekites.

Passing over the description of Edom and Moab (including the pillar of salt supposed by the Arabs to be Lot's wife), I would particularise Mr. Palmer's account of the primitive stone-buildings found in the deserts of the south as far as Sinai. These consist of circular houses, with a vaulted roof, built of large rough stones; they served partly for dwellings, and partly no doubt for the graves of a pastoral race, which may of course have been Amalekitish, but may also have belonged to an earlier prehistoric population. Mr. Palmer compares similar buildings in other very different parts of the world.

In the description of Sinai, a full discussion is given of numerous remains of the historic period, e. g. of the Egyptian copper and turquoise mines, according to Egyptian inscriptions, the date of which can be determined. The so-called Sinaitic inscriptions in the Wady Mokatteb and elsewhere, many of which Mr. Palmer copied, are ascribed to a heathen and commercial people. He attaches little importance to them, but it is to be hoped that he will publish his copies and interpretations, since those of Beer and Tuch may require to be supplemented and corrected. One would also have been glad to see the publication of the sepulchral inscriptions from Petra.

FR. DIETRICH.

### Intelligence.

Dr. Ginsburg's report on his recent expedition to Moab, read before the geographical section of the British Association, has just reached us through the kindness of the author. It will be in the recollection of most readers that Dr. Ginsburg and his fellow-travellers "fell among thieves," who extorted from them a large part of the sum generously presented by the Association. A scarcely inferior misfortune was the sudden departure of Mr. Klein, the missionary, who was indispensable to the travellers from his knowledge of the language and ways of the Bedouins. But there are points of much interest to Biblical students, which must not be passed over, though we have not space to discuss the correctness of Dr. Ginsburg's conclusions.—In Num. xxi. 14, Vahab in Suphah (Saphia) and the brooks of Arnon are stated to be the southern and northern boundaries of Moab respectively.—From the name of the Wady Korcha (a short distance from the ruins of Um-el-Hashib) it is inferred that Korcha in the inscription of Mesha (lines 3 and 21) is the name of a town. Dr. Ginsburg is convinced that the place where the famous Moabite Stone was found is not the site of the ancient Dibon, but of Korcha. Mesha himself asserts that he erected the pillar at Korcha, and as it was too heavy to have been brought from another place without injury to the inscription, the spot where it was found must be the site of its original erection. There are several old ruins in the neighbourhood, one of which may be Dibon. The Dibân of the Arabs has been produced to order.—Dr. Ginsburg thinks there is no reason for identifying Kerak with Kir Moab or Kir Hareseth.—A place called Mochra, of which extensive ruins remain, is identical with the Mochra of the inscription of Mesha (line 14).—Ar Moab, which was in the extreme north, is not the same as Rabba, which is almost in the centre of southern Moab.—In conclusion, Dr. Ginsburg observes that the most remarkable part of his experience is the ignorance of the Bedouins as to the nomenclature of the region between Dibân and the Jordan. The reason of this simply is that the law of supply and

demand, which has produced such great results in Palestine, has not yet been called into operation in Moab, at least not to the south of the Arnon. To explore the country properly, two or three scholars should go and live on the spot quietly for a few months, without putting any leading questions to the natives, and devote themselves to securing those lapidary records which alone will fix the names of the places wherein they have been buried.

M. d'Eichthal, well known as a quondam social reformer, and also by an unfinished critical work, *Les Évangiles*, has directed his attention to the traditions of the Exodus recorded in the Pentateuch and Manetho. The first instalment of his *Annales mosaïques* has just appeared; it is characterized by Ewald in the *Göttingische gelehrte Anzeigen* (October 23) as combining "German erudition with French elegance," and presenting "extremely sound views and tendencies." It is hard to reconcile the latter statement with the view of the author that the Israelites sojourned 950 years in Egypt.

Mr. Crowfoot has supplemented his useful labours on the Curetonian Syriac fragments by some observations on the relation which they bear to the textual criticism of the Gospels (sold by Williams and Norgate). He still refers for the most part to the Greek text of Scholz, but now and then compares that of Tischendorf. In the introduction he states his grounds for holding that the Curetonian recension was that used by the Syrian church in the third and probably in the second century, and that in the revised Peshito we have an Arianising revision of the date of the fourth century.

Professor Mössinger, of Salzburg, has brought out a brief "supplement" to Cureton's *Corpus Ignatianum* (by Wagner, Innsbruck). The contribution of most importance is the Syriac translation of the Martyrium of St. Ignatius, and of the Epistle to the Romans, only fragments of which were printed by Cureton, from a copy of an old Nestorian MS.

Everyone will rejoice to learn that Dr. Tregelles' great edition of the Greek text of the New Testament is now complete. The Apocalypse has just been edited by Mr. B. W. Newton, formerly Fellow of Exeter College, Oxford, in conformity with Dr. Tregelles' manuscript. The Prolegomena are now in preparation.

Mr. Elzas, a Jewish scholar, has brought out a translation of the Book of Job, with critical and explanatory notes (to be had of Trübner and Co.). Excellent as it is in design, it is not to be compared in execution with the riper scholarship of Mr. Rodwell's version. The latter work, however, is unprovided with a commentary, while Mr. Elzas has managed to compress much useful information, and once and again some acute criticism, into his footnotes. Thus he surmises, independently of Dr. Grätz (*Monatsschrift*, June), that the 28th and part of the 27th chapter form the missing third reply of Zophar. There are also useful references to Jewish interpreters. It is a pity that these are interspersed with notices of second-rate modern critics; a pity too that Mr. Elzas has expressed such an uncritical opinion on the date and authorship of the poem, which he supposes to have been translated by Moses from the Arabic!

### Contents of the Journals.

**British Quarterly**, October.—The Authorship of the Fourth Gospel. [Discusses most of the usual points both of external and internal evidence sensibly and with knowledge, but strangely omits to notice the peculiarities of the Johannine discourses. Renews, without any novelty of argument, the now generally abandoned attempt to show that the fourth Evangelist adopted the Synoptic date for the Crucifixion.]

**Theological Review**, October.—Prof. Russell Martineau takes occasion from Dr. Kalisch's recent work to review the argument for the late origin of the Levitical legislation. The approval extended to it by the able writer of Ewald's *History of Israel* is significant.

**Revue Critique**, September 7.—M. St. Guyard reviews a recent brochure in Russian by M. Harkawy on the primitive abode of the Semites, Aryans, and Hamites. [M. Harkawy, who writes from an "orthodox" point of view, identifies Shem, Ham, and Japheth with the mountain-ranges called Sim, Amanus, and Niphates respectively. He observes that Amanus occurs under the form Khamanu in the cuneiform inscriptions. Sim is attested by Moses of Khorene (i. 6, &c.); Niphates is the Armenian Nepat. Each of these branches of the Taurus forms the boundary of one of the groups of nations catalogued in Gen. x.]

**Jahrbücher für deutsche Theologie**, vol. xvii. No. 3.—Palmer: On the Explanation of Prophecy with reference to Events and Conditions of the Present.—Schmidt: The Resurrection of the Lord, and its Significance for His Person and His Work, with special reference to Keim's *Life of Jesus*.—Heman: Schleiermacher's Idea of the *summum bonum* and the Moral Problem.—Weizsäcker: The Mode of Papal Election from 1059 to 1130.—Notices: J. G. Müller's *The Semites*, &c.; rev. by Diestel. [Attempt to show that the Semites were originally Indo-Germans, whose language was greatly modified by contact with

Hamitic races; while customs and religious peculiarities were preserved in much greater purity.]—Kelle's translation of *Offried*, and Grein's of the *Heliand*, and other documentary works of historical theology; rev. by Wagenmann.—Jul. Müller's *Dissertations*; rev. by Herrlinger; &c.

Theologisches Literaturblatt (Roman Catholic), September 23.—Kraus: On the Mock-Crucifix of the Palatine, and a newly discovered Graffito; rev. by Reiser. [Disposes effectually of the hypothesis that the ass on the graffito is a symbol of Typhon; but proposes a still stranger one—that there were Christians in the fourth and fifth centuries who were given to *onolatry*. He refers, *inter alia*, to Cod. Justinian. i. tit. ix. 12.]—October 7.—Lipsius, Hilgenfeld, and others, on *Peter in Rome*; rev. by Kraus. [Urges the argument from de Rossi's researches in the catacombs against Lipsius' view.]—October 21.—Ginzler's works on Church History; by Schwab.—History of the Reformation in Holland; Hugo Grotius' return to Catholicism; &c.—November 4.—Works on the Pastoral Epistles; rev. by Langen. [Dr. Langen thinks that the un-Pauline peculiarities indicate a divided editorship.]—Baumstark's *Christian Apologetics*, vol. i.; by Dippel. [The book shows philosophical culture, and a just appreciation of the questions at issue. It treats of man (1) as an intellectual, (2) as an individual, (3) as a religious being.]

### Philosophy and Physical Science.

Aristotle. By George Grote. Edited by Alexander Bain, LL.D., and G. Croom Robertson, M.A. Two Volumes. Murray.

IMMEDIATELY after the publication of *Plato and the other Companions of Sokrates*, Mr. Grote turned with characteristic energy to the still more serious task of treating Aristotle in the same large and comprehensive manner. To the sorrow of all who value a high and noble nature, death overtook him in the autumn of last year, before half his work had been accomplished. These volumes, accordingly, are but a fragment; and we miss much to which we had looked forward. We are left to imagine the firm hand with which he would have sketched the theories of the *Politics* and *Ethics*; the interesting light in which he would have known how to exhibit the *Rhetoric*; the excellent results that were to be expected, in another department of the Aristotelian encyclopaedia, from the patient and accomplished author of the monograph on the *Timaeus*. And our regrets for what we have not are modified by a very limited satisfaction with what we have. Although the book traverses well-worn ground, it cannot be said to popularise an erudite subject, nor yet does it present any great or definite contribution to knowledge. We must bear in mind, too, that it suffers from appearing as a posthumous work, incomplete and unrevised by the author himself; and that a severe sense of editorial duty seems to have deterred Mr. Grote's literary executors from amending it with the freedom requisite to make it worthy of so eminent a name; the consequence being that it is disfigured by most perplexing modes of expression and by the retention, not only of material defects, but also, in

some instances,\* of the obvious slips and oversights unavoidable in a first draft.

The introductory "Life of Aristotle" is from the nature of the case the most successful, as well as the most readable, part of the book. It gives us a vigorous picture of Aristotle as a man, living at a moment the like of which the world has not seen since, and personally influenced by not a few of the great social and political causes then in operation. Here Mr. Grote's power of seizing the historical situation comes into play with admirable effect. Take, for example, his remarks on the epithet "half-Greek," more than once applied to Aristotle in recent times. After reminding us that in point of fact Aristotle's ancestry was on both sides Hellenic, that Stageira was a Greek colony, and that the epithet is not literally accurate unless we choose to regard all the Hellenic colonies as half-Greek, Mr. Grote proceeds:—

"But it is true of him, in the same metaphorical sense in which it is true of Phokion. Aristotle was semi-Macedonian in his sympathies. He had no attachment to Hellas as an organized system autonomous, self-acting, with an Hellenic city as president: which attachment would have been considered, by Perikles, Archidamus, and Epameinondas, as one among the constituents indispensable to Hellenic patriotism."

(I. p. 14.)

This is well and opportunely said. It has a worth, even if W. von Humboldt had another order of facts in view in the observations which have suggested the epithet. Humboldt, indeed, we must remember, was speaking of the *Poetics*, and he found it hard to imagine how a Greek of that age could have conceived such a book; rightly or wrongly, he thought he saw something "un-Greek" in the dry light of Aristotle's intellect, in his austere and entire surrender to the pursuit of *wesentliche und nüchterne Wahrheit*. Language such as this, it is clear, was not primarily intended to be tried by an ethnological or political standard of truth.

A chapter on the *Canon* gives us a preliminary argument in favour of the general authenticity of our extant Aristotelian literature. Among the forty-seven works in the printed editions, Mr. Grote believes there are "about forty treatises of authenticity not open to any reasonable suspicion"—a statement which (whether we agree with the numerical estimate or not) implies a noteworthy admission, when we reflect that it comes from one so conservative as Mr. Grote was in all matters of criticism. The intrusion of the seven *pseudepigrapha* is plausibly explained by the hypothesis that the library of Apellicon (on which the first editors are said to have worked) was composite, and that the same was the case with the collection of Neleus, incorporated in that of Apellicon: Andronicus and his fellow-labourers, therefore, had to follow their own judgment in sifting a heterogeneous mass of documents, and distinguishing the works of Aristotle from those of Theophrastus, Eudemus, and others. Mr. Grote, it should be added, accepts the Scepsis story with all its details. We shall not just now express an opinion as to the credibility of Strabo's narrative, but we may as well confess at once to some slight sceptical prejudice whenever we hear of literature hidden away in cellars and emerging into daylight at the time when most wanted. One point in the story, however, involves some grave historical considerations. We are told that the intellectual barrenness of the Peripatetic School after the death of Theophrastus was owing to a removal (to Scepsis) of the more strictly philosophical writings of the founder: during this period of darkness the learned had little more than his "exoteric" works; they knew him "chiefly from the dialogues, the matters [?] of history and legend, some zoological books, and the

\* Here are two from the first volume:—P. 30, "Proklus *adv. Joann. Philoponum*;" p. 28, "Four marble animal figures" (as a translation of the Greek given in the notes, *ἑξὰ λίθινα τεραστήρια*).

problems"—"it is certain that neither Cicero nor the great Alexandrine *literati* anterior to or contemporary with him knew Aristotle from most of the works which we now possess" (i. p. 57). Setting aside the question how Mr. Grote gets at the above list, and whether the writings specified are to be considered identical with what Strabo understood by the term "exoteric," we cannot but note the singular discrepancy between the present estimate of Cicero's worth as an authority and that so forcibly expressed by Mommsen. Taken at his best, however, Cicero can hardly be deemed the measure of the highest attainments of his time. To infer from him that certain books were difficult of access in his day is like arguing that Bacon must have been as good as forgotten when Lord Macaulay gave his famous Essay to an admiring public; or that Kant is never read out of Germany because some English thinkers exhibit no very intimate acquaintance with his masterpiece. Under any circumstances, Mr. Grote puts his case too strongly. Cicero confessedly knew the outside of the *Topics* and *Nicomachean Ethics*—the latter book being one of which his authorities manifestly possessed a knowledge far from superficial: Philodemus, again, was a reader of the *Economics*; and the older writer from whom Horace borrows in the *Ars Poetica* seems to have been tolerably familiar with the *Poetics*. Here, then, are some highly important Aristotelian works which, notwithstanding the paucity of data, can be *shown* to have been in the hands of Cicero's contemporaries or predecessors; and if they had so much, it is a legitimate induction to say they must have had more also; but it is not equally legitimate to make our ignorance a warrant for definite assertions as to what they had not. The language about the "great Alexandrine *literati*" is unfortunate, since it may tend to encourage an illusory idea that we possess a complete or, at least, a considerable collection of their writings. The truth is that the Alexandrine period of Greek literature is practically almost a blank for us. Of the great works which might have thrown light on our difficulty, some have perished utterly and entirely; others survive, but only in fragments, in the same way as an ancient civilisation does in the mutilated records and monuments in a museum. The data being of this kind, what inference can be drawn where the evidence fails? Nevertheless, such evidence as there is does not bear out Mr. Grote's general view (in M. Heitz we should call it "paradox"). He concedes that the catalogue of Aristotle's writings in Diogenes Laërtius represents the index of Hermippus—a theory advanced by Brandis, and slowly but surely winning its way to universal acceptance. Now, whatever our opinion as to this catalogue, it is clear from it that the Alexandrine Library must have contained our existing Aristotelian literature, or the major portion of it, or a collection of precisely similar character to ours, only of infinitely larger extent. Pergamus, also, was probably not much worse off in this respect. There was thus an ample literature in existence, and it included speculative writings by Aristotle himself, or (at the worst) works undistinguishable, as far as subject and method are concerned, from his: it is incredible, therefore, that the Peripatetic School was reduced to the destitution described by Strabo, or that its barrenness was the result of a not irreparable loss—unless we believe there was a unique and mystic virtue in the handwriting of the founder. If the School was ignorant of his works, it is more consonant with the logic of experience to attribute the fact to indifference than to sanction the hypothesis of a catastrophe. A point commonly overlooked is that marked signs of speculative atrophy did not appear till some time after the death of Theophrastus. The next Scholarch was Strato, a vigorous thinker, and one who perpetuated his teaching in books; so that in his time the

torch of science was kept burning, and the rhetoricians after him were without excuse for their apathy and ignorance. Mr. Grote, indeed, in one place, so far ignores Strabo's story as to allow that the entire *Organon* was accessible after the Aristotelian library had become the private property of Neleus:—"as all these disciples," he says, in reference to Theophrastus, Eudemus, and Phnias, "composed treatises of their own on the same or similar topics, amplifying, elucidating, or controverting the views of their master, the Peripatetics immediately succeeding them must have possessed a copious logical literature, in which the six treatises now constituting the *Organon* appeared as portions, but not as a special aggregate in themselves" (i. p. 80). No doubt this literature fell into neglect. The Lyceum gave itself up to rhetoric (as the Academy forgot its Platonism), and the sceptre passed into other hands—a phenomenon not without countless parallels in the history of sects and schools. So much, then, for one integral element in what we venture to term the Legend or Romance of Scepticism. The rest is of minor importance, though not devoid of difficulties. It is perhaps idle to ask, what led Apellicon to the belief that he was the fortunate possessor of the veritable autographs of Aristotle and Theophrastus; whether the discretion of this wealthy *amateur* was as great as his zeal; wherein he differed from the eminent savant in our own days who is said to preserve, among a number of similar treasures, a letter penned by no less a personage than Pontius Pilate! But the question as to the view Andronicus took of his MSS. is more to the point. To judge by results, he had no infallible criterion for his guidance (for he condemned the *De Interpretatione* and accepted the *Categories*); and if his materials were autographs, the only positive indication of their being this was their age or appearance of age.

We pass on to the discussion on the so-called "exoteric" works. Here—agreeing for the most part with the conclusion of M. Thurot, in his excellent *Études sur Aristote*—Mr. Grote argues that "exoteric" has a twofold meaning, and that it denotes "that which lies on the outside of philosophy considered in its special didactic and demonstrative march;" or, "that which is extraneous to philosophy and suitable to an audience not specially taught or prepared for the study"—in other words, the dialectical and rhetorical as distinct from the strictly philosophical treatment of a subject. By "exoteric discourses" (he adds) Aristotle does not of necessity refer to any other writings of his own—nor indeed to any other writings at all: "he may allude in some cases to his own lost dialogues, but he may also allude to Platonic and other dialogues, or to colloquies carried on orally by himself with his pupils, or to oral debates on intellectual topics between other active-minded men" (i. p. 70). This very comprehensive interpretation, it will be observed, embraces nearly all the narrower ones that have been proposed; among the rest, that of Bernays, who maintains (very convincingly, we think) that the term designates the dialogues. In the present state of the controversy Mr. Grote's wider view does not seem to satisfy all the conditions of the problem.

What remains is briefly described. It consists chiefly of a sort of paraphrase or abstract of the various treatises of the *Organon*, taken book by book in their canonical order, with an occasional break to introduce a few words of criticism or comment. Some of the treatises, doubtless, lose but little by this mode of exposition. But the case is different with a work like the *Posterior Analytics*, where the subject is organically connected by assumptions, psychological and metaphysical, with a larger whole: for an adequate or even intelligible account of such a book, one seems to require a wider survey and a less literal, less mechanical, treatment of the materials.

What Mr. Grote could do, when he chose to look beyond the letter of the text before him, may be gathered from the following lucid, if slightly fanciful, illustration of the Aristotelian idea of "science":—

"What he means by Demonstrative Science, we may best conceive by taking it as a small *résumé* or specially cultivated enclosure, subdivided into still smaller separate compartments—the extreme antithesis to the vast common land of Dialectic. Between the two lies a large region, neither essentially determinate like the one, nor essentially indeterminate like the other; an intermediate region in which are comprehended the subjects of the treatises forming the very miscellaneous Encyclopædia of Aristotle. These subjects do not admit of being handled with equal exactness; accordingly, he admonishes us that it is important to know how much exactness is attainable in each, and not to aspire to more." (I. p. 303.)

Perhaps, after all, the most marked feature in this abstract of the *Organon* is to be found in the full and elaborate analysis of the *Topics*—where the Socratic dialectic is systematized by Aristotle into a complete logic of scholastic disputation. The evident sympathy with which Mr. Grote approaches the subject will not surprise the readers of the *Plato*.

The work ends abruptly in the middle of an unfinished chapter on Aristotle's metaphysical and physical speculations. The editors, however, with laudable anxiety that nothing should be lost or withheld, have taken upon themselves the responsibility of annexing, as an additional chapter, an essay on the Aristotelian psychology, originally contributed to Professor Bain's book, *The Senses and the Intellect*—besides bringing together, in an appendix, a variety of memoranda and literary remains more or less directly bearing on the main theme of the work. The final impression left by these volumes is one of disappointment. After all possible allowance is made, the *Aristotle* strikes one as being inferior in value (as it necessarily is in novelty and interest) to its predecessor, the *Plato*. The account of the *Organon* is not a popular exposition of Aristotle's logic for the English reader; nor is it, we imagine, calculated to supplant Zeller, still less Prantl, in the estimation of serious and qualified students. Ungracious as the avowal may seem, we would readily exchange all we have for a single chapter on the *Ethics* or *Politics*, where Mr. Grote would have spoken to us with authority, on a subject which he had confessedly made his own.

L. BYWATER.

## Notes of Scientific Work.

### Chemistry.

**Barreswill's Test for Glucose.**—It is recorded by E. Feltz (*Comptes rendus*, 21st October, p. 960) that on testing a solution of crystallizable sugar for traces of glucose with the copper solution, he found cane sugar also able to reduce this metallic solution. 10 c.c. of this reagent, prepared by Violette's method, when boiled with 20 c.c. of a solution containing 6 grammes of purified sugar, for 25 minutes, lost its blue colour, all the copper being precipitated. The author calls attention to the fact, that, though different methods have been given for the preparation of this reagent, the essential difference between them consists in the amount of free alkali present. The greater the amount of alkali in the liquid the more clearly and sharply is the presence of glucose indicated by it. For his experiments with cane sugar he prepared two solutions: (a) containing 0.632 gramme of free soda in 10 c.c., and (b) containing 1.34 gramme of alkali in the same quantity. By boiling 20 c.c. of liquid containing 6 grammes of sugar with 10 c.c. of a, the colour disappeared in 25 minutes; when, in place of the latter, 10 c.c. of b were used, the colour vanished in 6 minutes. During some further experiments he noticed that 10 c.c. of b even lost all colour by being boiled with 0.6 gramme of pure crystallized sugar for 30 minutes.

**New Hydrocarbon.**—At the Leipzig *Versammlung Deutscher Naturforscher*, Professor Fittig announced the discovery of a hydrocarbon from coal-tar. It melts at 98°–99° C., and has a boiling-point considerably above that of anthracene. By oxidation it yields a dibasic acid,

which has led the author to the belief that this new body is very probably phenyl-naphthalene,  $\text{C}_{10}\text{H}_7\text{C}_2\text{H}_5$ .

**Seebachite.**—This name has been given by M. Bauer (*Zeitschrift der deutschen geologischen Gesellschaft*, xxiv. p. 391) to a new mineral, occurring in the basalt of Richmond, near Melbourne, in association with phillipsite and other minerals, and hitherto regarded as herschelite. Though fully agreeing with the latter mineral in crystallographic characters, seebachite differs from it in chemical composition, notably by a considerable percentage of lime. The empirical formula of seebachite is  $\text{R}_2\text{Al}_2\text{Si}_2\text{O}_{22} + 12\text{H}_2\text{O}$ , R being calcium and sodium.—In the same paper the author describes a crystal of calcite, from Andreasberg, exhibiting hemimorphism.

**Fermentation.**—In a communication made to the *Académie des Sciences* (October 7), M. Pasteur has shown that his celebrated theory of ferments admits of being expressed in a general form which is probably true of all living organisms. Every living thing, in fact, or part of one, however small, which, without absolutely ceasing to live, is deprived in whole or in part of oxygen, possesses the character of a ferment for that substance which seizes it partially or completely as a source of heat. If a fermentable fluid be inoculated with a ferment, the surface will speedily be covered with a coat of mould; this absorbs oxygen from the atmosphere, and gives off carbonic acid gas, but produces no alcohol. If the liquid be now agitated so that the coating of mould is submerged, fermentation will speedily commence under the proper conditions, and alcohol will be formed with the evolution of carbonic acid. Ferments are, therefore, organisms which can continue their existence and even grow without the intervention of free oxygen being necessary to burn and render available the materials for their nutrition; they can, in fact, assimilate directly oxidized matters, such as sugar, capable of producing heat by their decomposition. From this point of view fermentation appears to be a particular case of an exceedingly general phenomenon, and it may be said that all living things are ferments under certain conditions, because there are some which cannot momentarily be deprived of free oxygen. Under these circumstances they obtain the heat required for their nutrition or for changes in their tissues from surrounding objects; and it is a characteristic feature of fermentation that the amount decomposed is sensibly greater than the weight of material made use of in effecting the decomposition. Berard has shown that fruits kept in carbonic acid, or any inert gas, evolve carbonic acid, as if by a kind of fermentation. Pasteur made the experiment with plums, which after some days were far less altered in appearance and texture than those exposed to the air, but yielded a distinct amount of alcohol. A rhubarb leaf placed in an atmosphere of carbonic acid, after 48 hours produced, by distillation, small quantities of alcohol. With regard to animal organisms, Pasteur has not yet followed out his theory, but he believes it will throw an altogether new light on putrefaction and gangrene. The production of putrid gases without the intervention of organic ferments will receive, in this case, an explanation as natural as the production of alcohol and carbonic acid in the presence of the cells of yeast.

**Mineralogical Notices.**—At the last meeting of the Chemical Society, held on the 7th instant, a paper, bearing the above title, and forming a continuation of an earlier one, was read by N. S. Maskelyne and W. Flight, of the British Museum. The authors find by analyses of the original fragment to which Haidinger gave the name, and of several so-called specimens of the mineral from other localities, that isopyre is a mixture of opal with other substances, and can no longer be regarded as a distinct species. The mineral percolite, of which but one specimen, that in the National Collection, has hitherto been known, and the locality assigned to which is Sonora, Mexico, has been found in South Africa associated with anglesite, cerussite, and chlorargyrite. The chemical composition and physical characters fully accord with those of the unique specimen analysed by Dr. Percy.—Among other minerals from the same district in South Africa was found vanadinite in considerable quantity and great purity. The crystals are six-sided prisms, 211, surmounted by the regular six-faced pyramid {100, 122}; they also carry a scalenohedron {201}. The question whether the inverse correlative scalenohedral planes are present on these crystals is difficult to determine with certainty through their broken and incomplete character. But that the disclenohedron is not hemisymmetrically developed, in the way characteristic of apatite, seems certain from the position of some adjacent planes that are found on the crystals.—An analysis of a small specimen of impure uranophyllite from the neighbourhood of Redruth, in which the simultaneous presence of arsenic acid and bismuth was observed, is of interest to the mineralogist on account of the very recent discovery of trögerite, zeunerite, and walpurgine in the Weisser Hirsch mine at Neustädte, and the great probability of the existence of these minerals in Cornwall.—Analyses of pisolitic iron ores from Wales, and a specimen of prasine from Cornwall, occurring occasionally with the so-called white olivenite, are also given in this paper.

**Aldol.**—The history of this body has already been given in the *Academy* of July 15 (vol. iii. p. 271). Wurtz has since described (*Revue*

*scientifique*, 26th October, p. 405) some improved methods of obtaining the new substance, and while doing so has protested against the very violent criticism to which Kolbe has subjected him. Kolbe believes that the new body  $C_6H_8O_2$  cannot be characterized as aldehyde-alcohol till its nature is better known. Wurtz administers a well-deserved rebuke to the Leipzig professor for passing judgment on his work before it is completed. So far, his experiments justify him in assigning the formula  $CH_3-CHOH-CH_2-CHO$  to the new compound.

**The Influence of the Food on the Composition of the Urine.**—The nature of the change in the composition of the urine brought about by varying the character of the food has recently been carefully investigated by Weiske, of Proskau (*Zeitschrift für Biologie*, p. 246). He selected for the purpose two goats, one of which (I.) was fed on fresh clover and turnip leaves; the other (II.) entirely on milk. The urine in case I. was cloudy, exhibited an alkaline reaction, and effervesced with acid just as the normal urine in Herbivora does. In the other case (II.) the urine was completely clear, showed an acid reaction, contained no carbonic acid, and possessed all the properties of the urine of the Carnivora. 100 cubic cent. contained in each case:—

	I.	II.
Dried substance . . . .	11.08 grammes	1.75 grammes.
Nitrogen . . . . .	1.11	0.33
Hippuric acid . . . . .	0.10	0.00
Ash . . . . .	5.19	0.57

It is worthy of note, in the case of the goat fed on milk, that the large amount of nitrogen present in the urine is out of all proportion to the comparatively small degree of concentration.

Professor Tschermak has published a new catalogue of the meteorites in the Vienna collection. At the date of issue (October 1, 1872) the mineralogical museum contained specimens representing 182 falls of meteoric stones and 103 falls of meteoric iron. Letters appended to the name of each aërolite in the list indicate its position in a classification which has been based chiefly on the constituent minerals, certain distinctive physical characters of these minerals also being used in arranging them in subdivisions.

### Zoology.

**Prehistoric Remains of the Fallow Deer and Dog.**—In a treatise on the prehistoric antiquities of Olmütz and the surrounding country, published in the *Mittheilungen der anthropologischen Gesellschaft zu Wien*, Professor L. H. Jeitteles, in his researches respecting the antiquity of certain animals, has arrived at some conclusions of great zoological interest:—1. The fallow deer is not, as generally supposed, a recent importation from Africa, but was distributed all over Europe during the diluvial period, and in still later times. Subfossil remains of this species have been found in the neighbourhood of Rome, in Southern Russia, at Linz in Upper Austria, in Würtemberg, Baden, and at Abbeville; and the author himself has obtained part of a horn at Olmütz. 2. The dog of the Bronze age is a distinct species from that of the Stone age, and is distinguished in being of considerably larger size. Besides the common wolf, Prof. Jeitteles divides the wild dogs into two groups: *a*. The jackal of the Mediterranean fauna (*Canis aureus*), which is the wild ancestor of the domestic dog of the Stone age. *b*. The prairie-wolf of North America, the wolf-dog of North Africa (*Canis lupaster*), the Pyrenean wolf, the prairie-wolves of Eastern Europe, the dingo, F. Cuvier's *Canis anthus mas* from Senegal, and perhaps the wolf of Japan, are varieties of one and the same form which may be termed *Canis lycoides*, and which appears for the first time in a domesticated state in the Bronze age; this domesticated form is named by the author *Canis matris optimae*.

**Geschichte der Zoologie bis auf Joh. Müller und C. Darwin.** Von J. Victor Carus. München.—Many of our readers will be aware that the Bavarian Academy of Sciences some years ago appointed a commission to prepare and publish a complete history of the natural sciences in Germany. The idea originated with the present king of Bavaria, who has supported the undertaking in a most munificent manner. The entire work, which will be extended over about twenty-four volumes, is arranged in three sections, the third of which comprises technology, mathematics, physics, chemistry, astronomy, geology, medicine, zoology, botany, and mineralogy. The volume before us is devoted to the history of zoology, and since it would have been inadvisable to limit a description of the development of zoological science to that due to Germany alone, the author has extended it to the zoology of all countries and times down to the death of Joh. Müller, and the first promulgation of Darwin's doctrines in 1858–59. We fully recognise the great difficulties of the task undertaken by Professor Carus, especially when we consider that this is almost the first attempt of the kind; we feel sure, however, that the author, who has been engaged in bibliography for so many years, would, with more time at his disposal, have executed the work in a much more satisfactory and uniform manner. In its present form, fully two-thirds of the work are devoted to the history of the ante-Linnean period—the easier portion, as its details have been previously elucidated by numerous and profound researches. It was highly desirable, however, that a connected account

of this period should be given, and the reader is well repaid by the mass of information he will find here. The space allotted to the post-Linnean period is out of all proportion too small, provided the author intended to give it the detailed consideration he has in some instances attempted. A dry enumeration of authors and their productions neither instructs the zoologist (who, by the way, will miss many a familiar name, like those of Dampier, Mitchell, Cantor, Reinhardt, &c.) nor interests the general reader. The whole work is arranged under three divisions: A. The Zoological Knowledge of the Ancients; B. The Zoology of the Middle Ages; and C. The Zoology of the more Recent Times. The last division is again subdivided into three periods: 1. Period of the Encyclopaedic Accounts (Gesner, Jonston, &c.); 2. Period of Systematic Attempts (Linnean period); and 3. Period of Morphology (Cuvier, Müller).

**The Thanatophidia of India:** being a Description of the Venomous Snakes of the Indian Peninsula; with an Account of the Influence of their Poison on Life, and a Series of Experiments. By J. Fayer, M.D. London. With 31 coloured plates.—This work is divided into five sections. In the first a descriptive account is given of the venomous snakes of India; and as the author informs us that he has compiled this portion from the researches of other herpetologists, we may at once pass to section 2, containing statistical returns of the deaths by snake-bite that have occurred in the Bengal presidency. The author shows that the total number of such deaths recorded from the year 1869 alone amounts to 11,416 in an area presenting a population of 121,000,000 souls; and he thinks that this number, large as it is, cannot represent the real mortality in those provinces, on account of the incomplete reports received from some parts of the country. Were perfect information available and collected from the whole of India, Dr. Fayer believes we should find that more than 20,000 persons die annually from snake-bite alone. After the author has thus opened our eyes in respect to this terrible destruction of human life, it is to be regretted that he is obliged to leave the question of the treatment of snake-bite, discussed in the third section of the work, exactly as it was. If the immediate endeavours to prevent absorption of the poison into the system are unsuccessful, as unfortunately is but too frequently the case, reliance is placed on alcoholic, ammoniacal, or ethereal stimulants for supporting the strength, and consecutive disorders of constitutional or local character are treated with such remedies as the peculiar symptoms may suggest. In section 4 the circumstances of a number of cases of snake-bite are narrated, and in section 5 a great number of experiments on the influence of snake-poison on animals described. While most of the conclusions arrived at were previously known, the following deserve particular attention, either because they are not quite in accordance with the views generally held by herpetologists, or in that they confirm previous isolated observations. 1. Differences have been noticed in the symptoms produced by the bites of different species, though none of them are of any great physiological or pathological importance; they are more of degree than of kind. In certain cases convulsions are more marked, and in others death is preceded by a more decided appearance of lethargy: in some local symptoms are peculiarly severe, in others less so. 2. After death from poisoning by a colubrine snake, the blood nearly always firmly coagulates on removal from the body; after death by viperine poison, however, it remains permanently fluid. 3. The power to resist the action of the poison varies generally, though not altogether, with the size of the animal bitten; it has been noted that cats resist the influence of the poison almost as long as dogs three or four times their size. 4. The poisonous snakes are not affected by their own poison: a cobra may bite itself or another cobra with impunity. It is probable that they are not entirely without effect on each other, though it is infinitely less than that produced on other animals. 5. Snake-poison is absorbed through delicate membranes; its action is fatal if it be applied to a mucous or serous membrane, to the stomach or the conjunctiva. The belief that it is only capable of absorption by direct injection into the blood is erroneous. 6. Bodies of animals which have been poisoned by snakes are eaten with impunity by man and animals. 7. The blood of an animal killed by snake-poison is itself poisonous; if injected into another animal, it destroys life. The long series of experiments on which Dr. Fayer has been engaged could not have been conducted without great risk to those concerned in them. On two occasions only was there any cause for anxiety, and by the immediate application of remedies no injurious results happened. The work is illustrated by thirty-one coloured plates, which, highly creditable to the artists who prepared them, have been drawn at the School of Art in Calcutta. They fully answer the purpose of the work, which is more of a practical than scientific character.

**The Birds of New Zealand.**—In the *Academy* of May 15 (vol. iii. pp. 189, 190) we recorded the first appearance of Dr. Buller's work, *A History of the Birds of New Zealand*. We have now the pleasure of announcing the more recent publication of a second part, comprising pp. 73–140 and seven plates. The standard of excellency of the first part is maintained in the second, both as regards text and illustrations.

**The Cabbage Butterfly in the United States.**—According to Dr. Uhler, of Baltimore, the European cabbage butterfly (*Pontia brassicae*), in its invasion of the United States, has at length reached Baltimore. It has been found for some years farther eastward, and has been slowly creeping onwards until it bids fair to ravage the whole country. (*Annual Record of Science*, 1872, p. 270.)

The tenth part of the *Anales del Museo Público de Buenos Aires* (Buenos Ayres) contains the conclusion of Professor Burmeister's monograph of the Glyptodont Mammalia (see *Academy*, vol. iii. p. 73). In this part the author gives a comparative description of the subgenera *Glyptodon* and *Schistopleurum*, illustrated by six beautifully executed lithographic plates.

### History.

**Calendar of the Clarendon State Papers preserved in the Bodleian Library.** Vol. I. To January 1649. Edited by the Rev. O. Ogle, M.A., and W. H. Bliss, B.C.L., under the direction of the Rev. H. O. Coxe, M.A.

FULLER's well-known definition of an index as "a necessary implement," failing which the student wanders in a threadless maze, is eminently appropriate in this useful and laborious *Calendar*, the first volume of which is now before us. The masses of political and social history for which the whole work will supply the clue form the famous collection gathered by the royalist chronicler of the Great Rebellion as materials for that *History*. This collection has arrived in several instalments and at various dates to its final repository; the first portion reaching the Bodleian Library in 1759, while the last—a large and highly important body of documents, bequeathed by Henry Hyde, Earl of Clarendon, in 1753—was only received at Oxford in 1866. Consequently, the three folios published in 1786 by the University, comprising

a very large selection from the Clarendon State Papers up to that time in its possession, include no portion of its latest acquisition. The folio selection has, moreover, been now long out of print, so that on all hands the student will be grateful to Messrs. Ogle and Bliss for their *compte rendu* of documents throwing the fullest light on so important a period of English history. Of the three thousand papers here calendared, those employed by Hyde for his *History*, with letters both public and private addressed to himself, are endorsed by his own hand. Copies of his own letters and the correspondence of his secretary Edgeman form another important part of the collection, which also includes many holograph drafts and letters of Charles and his queen. The papers, which cover the whole period of Charles' reign up to his execution in January 1649, are chronologically arranged, and to the outline of most documents now in print is affixed a reference to the full text.

So far as an opinion can be formed from abstracts, we should say that, while the broad facts both of the progress of the Civil War and the personal history of its chief actors have been long before the world, abundant matter rich in details of more or less importance still lies in manuscript. This point may be fairly illustrated in reference to the historical masterpiece which was the growth and outcome of all the gathered material. Clarendon has in his *Life* himself sketched out for us his tranquil and studious existence in Jersey, from the spring of 1645 to that of 1648, the time which saw that work planned and its first four books written, but the accessories of the picture remain to be filled in from his correspondence during that season of retreat. Writing to Lord Witherington in August 1646, Hyde first announces that he has "prevailed with himself to endeavour the compiling a plain faithful narrative of the proceedings of these ill years." On November 15, in the same year, he writes to Secretary Nicholas for information of all kinds for the *History*, of which he has now written about sixty sheets, which, if printed, "would exceed what Daniell hath written of twelve kings; to what a Book of Martyrs will the whole volume swell!" The whole tenor of the Jersey correspondence goes to show that the chronicler of the royalist martyrs had no mind to swell their number in his own person, presenting at the same time, we think, a noteworthy example of that proverbial absorption of mind induced by literary pursuits. It is pretty clear that while Hyde, in his own "wonderful contentment," dresses the facts and paints the characters of his narrative, the disasters of his country, the ruin of his friends and cause, even the deadly peril of his master, these things fall naturally into the background of his mind. Take, for instance, Hyde's correspondence after the opening of 1647, when the series of news-letters marks the progress of events as hurrying on towards the scaffold before Whitehall, and the king's despatches Nos. 2400, 2411, 2461, breathe the language of despair. How entirely out of keeping with the stern realities of the time is the chancellor's gossip over his studies varied by reading "ill-books, such as Lilburne's, Prynne's, and Mr. Milton on Wedlock," No. 2488, his liberal information touching the progress of his *History*, and eager quest for materials from all quarters, mixed up with parenthetical forecasts of "fine days after the dismal storm," No. 2658. Goethe polishing his verses at Weimar while French troops harried Germany hardly affords a more striking spectacle of philosophic equanimity. Indications are not wanting that Hyde's friends, themselves out in the storm, were at issue with him as to his own line of conduct. They unreasonably refused to accept that personal view of it which, formulated into the motto, *Bene vixit qui bene latuit*, stood blazoned over his doorway in Castle Elizabeth. Most of

them, the king included, judged the chancellor's retirement as a secession from the important trust committed to his charge in the person of the Prince of Wales, and he seems to have been repeatedly reproached for not following him to St. Germain. Now here we find copies of Hyde's answers to the king and others vindicating his conduct; but how comes it that the letters of blame themselves have all vanished? We note this fact as highly characteristic of the man, and also because a more striking illustration of the way in which the chancellor sifted his papers for the eye of posterity occurs at an earlier date. No part of Hyde's narrative has cast graver doubts upon his truthfulness as an historian than the account of his personal action in the Long Parliament between the introduction of the bill of attainder against Strafford and the passing of the Grand Remonstrance—April–November 1641. It is strongly suspected that Hyde, though in the *History* he labours to create the contrary impression, was a party both to the attainder of Strafford and to the existence of the parliament independently of the king; he also stands charged with having falsified the circumstances under which the Grand Remonstrance was passed. Now among the despatches of those months, not a single document throwing light upon these important questions survives to be calendared. We offer no comment upon their conspicuous absence. The fact that Strafford's famous letter from the Tower, May 4 (No. 1527), appears endorsed by Clarendon's own hand is, as Mr. Ogle remarks, a strong piece of evidence in favour of its genuineness.

Among the various series of papers worthy of special attention, those upon foreign affairs running over the years 1637–40 present, with some exceptions, fresh matter. They mark the utter weakness of English intervention in the affair of the Palatinate, showing that England under Charles had in the eyes of foreign nations sunk down to the same level of insignificance to which fifty years later Spain had fallen. Among new materials illustrative of negotiations in behalf of the royal cause carried on in Ireland, the most important are letters from Charles to Ormond, written in 1645–6, which seem likely, if fully examined, to throw additional light on the secret dealings with the Council of Kilkenny, entrusted by the king to Glamorgan. To the same date belong despatches, mostly not yet printed, detailing the movements of the army of the West, and amply illustrating the disorganization, rapine, and confusion upon which the royalist historian dwells with mournful emphasis. As specimens of single documents deserving particular notice, Nos. 1764, 2887, 2978 may be cited. The first of these, in the same handwriting as a paper endorsed by Hyde, "Sir Hugh Cholmeley's Memorials," gives a minute account of the battle of Marston Moor; the second, partly printed in the Clarendon State Papers, is Lord Byron's history of his proceedings in Cheshire and Anglesea, February–September 1648. Judging from the abstract, Byron's narrative is important enough to raise surprise at the very slight use of it made in the *History*. The main point of interest in the outline given by Mr. Bliss lies in reiterated charges of active disloyalty brought by the royalist general against Williams, Archbishop of York. Everything tending to throw light upon the character of that able but unscrupulous prelate deserves to be made public. But the charge is entirely passed over by Clarendon; did he himself disbelieve Byron's statements, or was he unwilling to tarnish an archiepiscopal reputation? No. 2978 is a narrative of the surprise of Pomfret Castle in 1648, and the subsequent action of the royalist garrison up to the retaking of the castle by Cromwell after his return from Scotland. This paper, drawn up after the king's death "by one of those concerned in the despatch of Rainsborough,"

is noted by Mr. Bliss as differing in many particulars from Hyde's version of this episode of the war; the abstract is, however, too meagre for purposes of comparison. And lastly, we should much like to see in print the full text of the letters of intelligence, a most valuable series, during the years 1647–8.

Calendared as addenda are above three hundred copies of letters addressed by Queen Elizabeth to foreign princes during the early years of her reign. These despatches, which have not been used by Mr. Froude, will doubtless well repay examination. Elizabeth's letter to Gustavus of Sweden, declining marriage with his son on the score that "God has filled her heart with the joys of celibacy;" those to Italian princes pressing for payment of moneys due; a warning to Mac 'Art More that, "next to the service of God, nothing is of more consequence than obedience to the prince;" her resolution, expressed to Lutheran sovereigns, that, "in spite of the devil," the creed of her Anglican Church shall be conformed to the Augsburg Confession—may be quoted as characteristic of the daughter of Henry VIII. Lastly, the appendices contain despatches touching the marriage of Charles I. and the love-letters which passed between him and Henrietta Maria, the latter printed in full. Mere stereotype complaisances of royal courtship, these holographs owe their chief interest to the dramatic contrast they oppose to the correspondence of the wedded pair during the last years of the king's life—letters where the wife shows herself a dangerous partner in the losing game, and the husband lays bare without stint those deep defects of character for which he paid forfeit with both crown and life.

GEORGE WARING.

*History of Old Rhaetia.* [*Das alte Rætien*, staatlich und kultur-historisch dargestellt von Dr. P. C. Planta. (Hierzu zwei Tafeln.)] Berlin: Weidmann.

THIS work has been a labour of love to Dr. Planta, who dedicates it to the Swiss cantons of the Grisons and St. Gall, as being parts of the ancient Rhaetia. He collects all that is known of Rhaetia from the pre-Roman times, down to the occupation of the country by the Germans, its civil division into *Gaus*, and its ecclesiastical organization as connected with the bishopric of Chur. The appendices contain an excellent map, together with the necessary extracts from the Peutinger table (of which a facsimile is given), the Antonine Itinerary, and the *Notitia Dignitatum*; Bishop Tello's will (A.D. 766); a diploma of Charlemagne, appointing Bishop Constantius "Rector of Rhaetia," and so his successors "ex nostro permissio et voluntate cum electione plebis"; Bishop Remedius' Penal Code; the *Lex Romana Curiensis*; a diploma of Louis the Pious in 831, exempting the possessions of the church of Chur from civil jurisdiction or taxation; and a Rent-roll of the church in the eleventh century. The latter part of the book is satisfactory, the materials being more abundant. Of the early history of Rhaetia, however, it is needless to say that we know next to nothing, and our author has to fill up his sketch as he can. Thus, as he thinks the northern slopes of the Alps were occupied by Kelts, he gives an account of Keltic customs and religion in general, as being presumably true of the Rhaetian Kelts also. We have no objection to the account, except that it has no peculiar application to Rhaetia. The description of the Etruscan inhabitants in the southern valleys has to be filled up in a similar manner. As to the name Rhaeti, which occurs first in Polybius as *Ῥαῖοί*, our author acquiesces in the derivation given by Theodoric, the Gothic king, that it comes from the Latin word "retia" (nets), because the country is composed of a network of

valleys, which "contra feras et agrestissimas gentes velat quaedam plagarum obstacula disponantur." But with all our respect for King Theodoric, as tribes generally give names to countries, and not *vice versa*, we can hardly derive the name of an Etruscan or Keltic tribe from a metaphorical use of a Latin word, not to mention other obvious difficulties. Our information as to the various Rhaetian clans really depends on Augustus' triumphal inscription at Turbia, near Nice (Pliny, iii. 30, enumerates the names of the Alpine tribes in accordance with it), which gives a list of them from east to west. Some of the names still survive, e.g. the Camuni must have lived in the Val Camonica. Strabo and Ptolemy supply some help, and there was fortunately found in the South Tyrol in 1869 a bronze tablet containing an edict of the Emperor Claudius in A.D. 46, relating to four Rhaetian communities, two of which are the Anauni (in the Nonthal), and the Bergalei, whose name survives in a valley opening out towards Chiavenna. In fact, inscriptions are our main resource for provincial history under the Empire, as may be at once seen from the fifth volume of the Berlin *Corpus Inscriptionum*, just published by Mommsen, which contains the inscriptions of Cisalpine Gaul, including those of Trent and other Rhaetian districts on the south of the Alps. Dr. Planta is a little grieved at finding so little mention of his favourite Chur, the original name of which can only be guessed at. The account of the organization of a Roman province is well arranged. Of course the introduction of Christianity is obscure, but Dr. Planta does not like the legend which assigns the foundation of the bishopric of Chur to the famous British king Lucius, who was martyred there A.D. 178, and has a special commemoration in the service-books of the *Ecclesia Curiensis* (the early printed copies of which are rare, but there are several in England). King Lucius' body was stolen from the cathedral in 821 by a Count Roderic, as the Bishop complains in a letter to the Emperor Louis the Pious. The first real historical trace of the bishopric occurs in 452, when the Bishop of Como signed the decrees of the Council of Chalcedon for himself and "for his absent brother Asimo, bishop of Chur." The bishops played an important part even after the German counts took the lead and the *Gau*-constitution had been introduced. The name Vinstgau, in the valley of the Adige, curiously preserves the memory of the early tribe of the Venostes, mentioned in the Turbia inscription, and of the German constitution of Rhaetia in Charlemagne's time. Dr. Planta's book possesses more than a local interest; it gives an excellent account of the process of fusion between the Roman and Teutonic elements of modern Europe.

C. W. BOASE.

*Origines de l'Allemagne et de l'Empire germanique.* Par Jules Zeller, ancien Recteur de Strasbourg. Paris: Didier.

THE words, "ancien Recteur de Strasbourg," give the key to this work, which embodies the grief of France at the loss of Lorraine and Alsace. Of course there is a long preface against Bismarck, and the author takes particular delight in quoting passages of ancient authors which describe the Germans as fond of invading and plundering their neighbours, e.g. Caesar, iv. 13, "latrocinia nullam infamiam habent quae extra fines civitatis fiunt." The ancient Gauls, it must be inferred, always stayed quietly at home, and did not plunder Italy, Greece, and Asia Minor. The spirit of the book is lamentable, and can only be excused by the soreness of defeat, and by the ungenerous conduct of the German *literati*. Thus during the siege of Paris, Mommsen wrote an account of the siege of Rome by the Goths, describing the cowardly multitude sheltered behind the walls; and how

the government offered any amount of money for peace, but vaunted that they would not surrender an inch of territory, and so on. The geographical sketch of Germany, illustrated by a map, is the best part of Zeller's book, which goes down to Charlemagne's time, being only the first volume of an extensive work. We must hope that by the time the second volume appears, the author will have adopted something more of the tone that befits a historian. C. W. BOASE.

### Philology.

A Critical Enquiry into the Bases of the Decipherment of the Assyrian Inscriptions. [*Die assyrisch-babylonischen Keilinschriften. Kritische Untersuchung der Grundlagen ihrer Entzifferung.*] By Dr. Eberhard Schrader. Leipzig: Brockhaus.

The Cuneiform Inscriptions and the Old Testament. [*Die Keilinschriften und das Alte Testament.*] By the Same. Giessen: Ricker.

WHILE the study of the Assyrian inscriptions has long been attracting a considerable body of workers in France and England, Germany, the home of Grotefend and Lassen, has been more or less content to look on. This, however, can no longer be said to be the case. Professor Schrader, already well known to Assyrian scholars by his papers in the *Zeitschrift der deutschen morgenländischen Gesellschaft*, the *Studien und Kritiken*, and elsewhere, has now offered a valuable contribution to our knowledge of the monuments and their language in the two works before us. The first of these may be called an Apology for Assyrian

decipherment. It is an exhaustive analysis of the method employed, and a critical testing of its results. The first part reviews the several means of assistance which have been at the disposal of the decipherers, beginning with the trilingual inscriptions of Persia, and going on to the variant readings furnished by parallel texts, and the invaluable aid as well as verification afforded by the philological tablets of Assur-banipal. Specimens of these are given, and a syllabary is made out from the native records themselves. The section concludes with the help furnished by the sculptures which accompany the inscriptions, by the tradition of ancient history, and by the philological laws which determine the reading of a word. Next follows a thorough-going exposition of the Assyrian syllabary and ideographs, controlled by reference to the Achaemenian monuments, and the proof and explanation of the polyphony of the characters. This is supplemented by an admirable excursus on the difficult subject of the proper names; and the whole finishes with the bilingual (Assyrian and Phoenician) legends which decisively confirm the decipherment as before set forth.

The second part consists of a full and excellent account of the language (on the basis of the Persian inscriptions), upon its lexical, phonological, and grammatical side; from which its thoroughly Semitic character is made apparent to everyone. The conclusions to be drawn from the preceding portion of the work are well put, and the Assyrian text of the Achaemenian inscriptions with a translation is appended.

The author must be congratulated upon the clearness, pertinency, and exhaustiveness with which he has completed his task. Rational scepticism will henceforth be impossible, while the accuracy and acuteness displayed in the grammatical part of the work will be particularly welcome to the scholar. The section on the numerals must be more especially noted, in which the formation of the decades is admirably explained and compared with the Aethiopic; and the section on the pronouns is equally good. The explanation of the obscure *mala*, "as many as," from מלא is undoubtedly right, in place of the one suggested in my *Grammar*; but the attractive reference of the enclitic *ma* or *va* to the *uaw consecutivum* can hardly be maintained in the face of a phrase like *ina sanat-ma siati*, "in this very year" (*W. A. I.* iii. 8, 75). In the verb, Dr. Schrader and myself are at variance as regards the explanation of certain forms, though not as regards their meaning. The double letter of what I hold to be a Kal present is not formative, but merely marks the accent of the preceding vowel, exemplifying one of the obscurities of the Assyrian system of writing. The tense is exactly parallel with the Aethiopic *yēndǵēr*, and it is difficult to see how Dr. Schrader can overlook the evidence of the syllabary he has printed in pp. 20–24, where the Pael present *yunaccar* answers to the Accadian *in-kurri*, and the Pael aorist *yunaccir* to the Accadian *in-kur*, just as the Kal present *isaccin* answers to *in-garri*, and the Kal aorist *iscun* to *in-gar*. The permansive of Dr. Hincks is the perfect of the cognate dialects, the name being adopted only because that of the perfect had been set apart for another purpose, and I cannot understand how Dr. Schrader can explain such forms as *pupula rabacu*, *acala dabsacu*, "crops I increase, corn I mature" (*W. A. I.* ii. 60, 14), otherwise than as verbs. Indeed he seems himself to admit this in note 3, p. 266.

The second work (already noticed in the *Academy*, vol. iii. p. 380) will be of especial service to the student of the Old Testament. The evidence of the monuments is given in full wherever it elucidates a Biblical passage, and the various historical questions that incidentally arise are discussed at sufficient length. The paragraph on 2 Chr. xxxiv. 11–14

may be particularly recommended. The glossary at the end of the volume will be found useful, and the chronologist will be grateful for the appendix, in which all that we possess at present of the Assyrian canon is given in full. The arguments urged against Dr. Oppert's theory of a break of forty-seven years in the canon leave nothing to be added. Perhaps it would have been better had the author deferred annotating the book of Genesis until we have a more perfect acquaintance with the bilingual tablets and the proto-Chaldaean legends. Some of his combinations in this part of the work are certainly not right. Thus, whatever may be the explanation of *Shinar*, it cannot be compared with *mat curra*, "the land of the east" (like *im curra*, "the east wind," or *mat martu*, "land of the west"), which almost always is preceded by *khar-sak*, "mountain" (as in *W. A. I.* ii. 19, 2, 45), in contradistinction to "the plain" of the Bible, while *mat* (*ma + da*) is "country," never "city." I am glad to find that Dr. Schrader has independently come to the opinion that the Biblical compiler in 2 Kings xviii. xix. has confused together two distinct invasions of Judaea, one by Sargon, circa B.C. 710, and one by Sennacherib, in 701. Indeed, this is rendered certain by the reference (xviii. 34, xix. 13) to Samaria, Hamath, and Arpad, the conquest of which was due to Sargon. Isaiah x. belongs, I believe, to the campaign of the latter king (see verses 9, 11); in this way we may explain the representation of the Assyrian expedition as coming from the north-east instead of from Lachish on the south-west. The ideal picture which the prophet has been supposed to be drawing scarcely suits one who was speaking to contemporaries in the midst of a national crisis. Possibly chapter xxii. also refers to the same period, but it may relate to the earlier attack upon Gaza after the capture of Samaria by Sargon. But this, with much else, we may expect to be cleared up by further acquaintance with the inscriptions; and Dr. Schrader deserves thanks for breaking ground in this department of study, and setting the results hitherto obtained before the general reader.

A. H. SAYCE.

A. Eberhard's *Fabulae Romanenses*. Vol. I.: *Syntipas et Vitae Aesopi*. Lipsiae: Teubner.

THE first volume of M. Eberhard's edition of what he calls *Fabulae Romanenses*—containing a reprint (with critical apparatus) of the previously known text of the mediaeval tale of *Syntipas* (*i.e.* the Greek version of the well-known tale of the *Seven Wise Masters*, for the English versions of which see F. J. Furnivall's work on *Captain Cox, his Ballads and Books*, Ballad Society, 1871, p. lvii, *sq.*), with an earlier text of the same now first edited, and a collection of the amusing *Lives of Aesopus* composed in the middle ages—will no doubt be welcome to every lover of this kind of literature, and may, we hope, contribute to increase the number of the readers of these attractive compositions. The earlier version of *Syntipas*, now first published by M. Eberhard, is not quite complete, but much superior to the later text in point of style. But precisely on account of its corrupt diction and macaronic mixture of ancient and modern Greek, we prefer the version in which we first became acquainted with the tale, and which we then knew only in Boissonade's pretty, but now scarce, edition—Paris, 1828. In the earlier version we have met with very few passages still in want of correction; we may, however, mention p. 151, 25, where *ἡρεῖτο* should no doubt be changed into *ἡρέτο*. In the later version we would suggest, p. 7, 17, *ἔκοντες* instead of *ἐκόντες* of the MSS. and *ἐκόντων* of M. Eberhard; p. 9, 5, *ἔως οὐ τὸ ἔργον . . . ἐκπληρώσῃ*, instead of *ἐκπληρώσει*, which does not suit the grammatical habit of the writer;

cf. p. 36, 15; p. 59, 13, and especially p. 134, 12, where the editor seems to have become aware of this peculiar use of the subjunctive—though somewhat late—at the end of his work. We would here observe (without censuring the editor too severely for this shortcoming) that we can frequently trace his own progress in the course of his work, and watch his familiarity with the diction and style of his author increasing with almost every sheet. This causes in parts the semblance of haste, but does not on the whole injure the solid character of the book. The editor observes on p. 14, 23, “πῶς, *i. e.* ὥς. Corais Στοχ. αὐτοσχ. ante Aelianum 46 n. 2”; but this grammatical note ought to have been made on the very first page, l. 13 (διήγησις . . . πῶς τὴν . . . διαβολὴν κατεσκεύασεν ἡ μητρὶς αὐτοῦ). Boissonade’s learned notes might occasionally have been turned to better use: *e. g.* on p. 2, 13, Boissonade properly observes (p. 172 of his ed.) the novel use of χρόνος as “year,” which is there very conspicuous on account of the preceding ἐτη; but M. Eberhard passes it over, and not before p. 91, 15, do we find a brief note on this peculiarity. (See also p. xi.) On p. 23, 20, ἄνω καὶ κάτω συστρέφας, the editor observes, “ἄνω καὶ κάτω quoquoersus *e sermone uol-gari desumptum uidetur*”; but why does he not simply quote Plato, *Theæt.* 153 D, τὸ λεγόμενον (*i. e.* the proverbial expression) ἄνω κάτω πάντα, “all is topsy-turvy,” for which Plato also says, ἄνω καὶ κάτω, and which occurs more than once in Attic writers (*e. g.* Eur. *Bacch.* 752), as the dictionaries may easily show? Beck in his index says, “formulam ἄνω τε καὶ κάτω invenies etiam *Suppl.* 689, *Bacch.* 740 et 752. *Herc. F.* 953, et *Pirith.* fr. vii. 3, et sine copula ἄνω κάτω, *Iph. T.* 282, *Bacch.* 349 et 602, *Herc. F.* 1307 et *El.* 802”; in the same way compare Meineke’s index, p. 587, of his first edition of *Menander and Philemon*. Last of all, Coraës (whom M. Eberhard delights in quoting) mentions the popular use of ἄνω κάτω in his commentary on Isocrates, p. 179. See also Krüger’s *Grammar*, § 59, 1, 2. We may also compare the Latin *sursum deorsum*, Ter. *Eun.* 278. It would thus appear that even the well-known use of the Latin *videtur* is rather out of place when speaking of a phrase so thoroughly Greek in all periods as ἄνω (καὶ) κάτω. Again, p. 54, 12, οὐδαμῶς γὰρ δύναμαι ἐνθυμηθῆναι, we have ἐνθυμῆσθαι in the modern sense, “to remember,” though the editor passes it *sicco pede*. In the same way we imagine that the peculiar use of ἀκλὴν οὐκ ἐχόρτανα, p. 92, 20, would have been worth a note, confirming as it does Coraës’ derivation of the modern ἀκόμη (or ἀκόμι), Πρόδρ. Ἑλλ. Βιβλ. μὴ: cf. also Lobeck on Phrynichus, p. 123. We should also have thought παρρησιάζεσθαι, p. 130, 16, deserving of a note: see Coraës on Isocrates, p. 122. We might point out other passages in which a note would have been of use, and for which space might easily have been gained by omitting such trivial observations as those on ἀγαποῦσι and other common peculiarities of modern Greek, for which it would have been much wiser to quote Mullach’s excellent *Grammar of Vulgar Greek* than to refer to the rare editions of Coraës’ books; and likewise numerous readings, which are really of no importance at all, and occur again and again in all late Greek MSS., might have been omitted. But to return to our text, we would further suggest, p. 15, 2, ἀκουσθῆσαν (cf. p. 30, 7); p. 34, 26, perhaps τὴν γυναικεῖαν μορφήν καρτερήσω, “I will bear a woman’s shape;” p. 35, 13, we should certainly read ἐξωγκωμένης (cf. ἐγγαστρωμένος, l. 19), or, if the correct form should be preferred, ἐξωγκωμένης; p. 39, 23, perhaps δ’ ἂν αἰτίσθης μου, as ABV have μοι; p. 55, 24, probably ἀπερχομένων; p. 63, 17, τι ἄλλο seems to be quite correct (the sense is “I shall not dare to give the king a different account [from what his son will no doubt tell him]”); p. 83, 21, doubtless ὅλως instead of ὥς ABV, ἐγὼ Eberhard; 86, 14, certainly συνωδίας; 105, 5, σμῆλον would be a better

accentuation; p. 114, 7, certainly διπερ (cf. 120, 7; 141, 15); p. 95, 11, M. Eberhard is right in keeping μηνῶσι of the MSS. in preference to Boissonade’s conjecture, μηνύουσι, as the analogous form μηνέ occurs in Florios, v. 921 (in my *Med. Greek Texts*). The diction of this work offers many interesting peculiarities: *e. g.* the words πολύευρος = πολυμήχανος, 100, 12; λουτράριος or λουτράρης, p. 37, which is then replaced by the classic βαλανεύς, 38, 2. In the same manner πορτάρης, 115, 21, *sg.*

The first *Vita Aesopi* has justly been joined to *Syntipas* by the editor, the general character of both compositions being quite identical, and one and the same story even occurring in both. The diction is here as good as may be fairly expected in the thirteenth century, though sometimes we meet with strange expressions; *e. g.* the late word πρόσδομα, 243, 7 (which is not given in Sophocles’ *Dictionary of Byzantine Greek*). P. 232, 10, we fancy that we discern a disguised iambic sentence:—

ἀγαθὸν δὲ πλήρες ἐλπιδὼν τό γ’ εὖ ποιεῖν.

We shall be glad to see M. Eberhard’s second volume; and hope that his “Index,” to which he refers more than once in the present volume, will contain many such accurate and learned observations as we should expect from the editor of the *Philogelos*.  
W. WAGNER.

### Intelligence.

The last number of Messrs. Teubner’s *Mittheilungen* contains an elaborate article, by L. Müller, on Quicherat’s edition of Nonius, which was also recently reviewed in our columns. From L. Müller’s showing it appears that the new edition is by no means “up to the mark,” and that very little has been done in it towards settling the numerous questions unfortunately connected with this most foolish of all Latin grammarians, who, however, happens also to be the most important of all in his bearing upon earlier Latin literature and language. We shall be glad to see L. Müller’s new edition. Generally speaking, modesty is not the fault of M. Müller, but in the present instance we are fully prepared to accept his statements as corresponding to truth. We are also pleased to learn that his long meditated edition of Lucilius is about to be issued.

The same number of the *Mittheilungen* contains articles on a forthcoming edition of Galenus’ work, *De Hippocratis et Platonis Placitis*, by Iwan Müller, of Erlangen; a new critical edition of Euripides’ *Medea*, by R. Prinz, in which trustworthy collations of the MSS. will be given for the first time; and on an edition of Juvenal with German notes, by Dr. Weidner. We hope that Mr. Mayor’s excellent edition will not remain neglected by Dr. Weidner, though the fact that he overlooked Professor Conington’s edition in his commentary on part of the *Aeneid* does not speak highly for his acquaintance with English publications. An etymological dictionary of the Latin language, by Dr. Alois Vaníček, is likewise advertised.

The seventh volume of August Böckh’s *Minor Writings* (containing his critical articles) has just been published. This edition is now complete, with the exception of the fourth volume, which is promised to follow shortly.

The first part of the second volume of the *Acta Societatis Philologae Lipsiensis*, edited by F. Ritschl, contains *Lectiones Stobenses*, by O. Hense; excellent *Quaestiones Onomatologicae*, by O. Sievers; a somewhat lengthy and pretentious, but satisfactory, treatise, *De Actorum in Fabulis Terentianis numero et distributione*, by C. Steffen; and *Quaestiones Erotasthenicae*, by L. Mendelssohn.

We understand that a new and revised edition of Mr. Paley’s *Pro-pertius* is about to be published shortly.

Dr. W. Wagner has had the offer of becoming the successor of Professor Dr. Koch at Eisenach, whose death we announced in our last number. Dr. Wagner has, however, decided to stay at Hamburg at present.

The death of Sig. Felice Fenzi, at the early age of 25, has robbed Italy of one of her most promising Orientalists. His work on Assyrian antiquities is highly praised by Ewald in a recent number of the *Göttingische gelehrte Anzeigen*.

M. G. Derenbourg’s long-expected edition of the *Opuscula* of Ibn Jannach is announced by Geiger as in the press; that of Saadia’s version of the Pentateuch seems to be postponed for the present.

### Contents of the Journals.

**Journal of the Royal Asiatic Society**, vol. vi. part i.—I. The Ishmaelites, and the Arabic Tribes who conquered their Country; by A. Sprenger. [Contests the view of those who consider the Ishmaelites as the ancestors of the Northern Arabians; see *Academy* of July 1 (vol. iii. p. 258).]—II. A Brief Account of Four Arabic Works on the History and Geography of Arabia; by Captain S. B. Miles. [Analysis of four works, manuscripts of which have been discovered, which throw much new light on the history and geography of ancient Arabia, especially the Hiniyar dynasty of Yemen; viz. the *Iktil fi Ansab* of Hassan bin Ahmed el-Hamdani; the *Kitab el-Ja'ireh* of the same author; the *Tarikh el-Mostabsir* of Ibn el-Mojawir; and the *Kurrah el-Oyün* of El-Dubbi.]—III. On the Methods of Disposing of the Dead at Lassa in Tibet; by C. Horne. [The paper is founded on a narrative supplied by a Lama of Lassa. The principal modes described are, exposure to the vultures; cutting the corpse into pieces and feeding the dogs with it; also salting and burning. The statements of classical writers are generally confirmed by this account.]—IV. The *Brihat-Sanhita*; or, Complete System of Natural Astrology, of Varāha-mihira. Translated from the Sanskrit into English by H. Kern. [Continued from chapter xxxvi. to chapter li.] V. Notes on Hwen Tshang's Account of the Principalities of Tokháristán, in which some previous Geographical identifications are reconsidered; by Colonel H. Yule. [Traces the Chinese pilgrim's wanderings from Samarkand to Kapiça, and the return route from Hupian to Yarkand, and proposes a number of new identifications, differently from Vivien de St. Martin and Cunningham. The *li* in which the pilgrim's estimates are given is not considered to be a scientific road-measure, the expression "one hundred *lis*" expressing "one day's journey," the distance varying according to the nature of the ground traversed.]—VI. The Campaign of Aelius Gallus in Arabia; by A. Sprenger. [Examines the accounts given of Arabia in Juba's *De Expeditione Arabica*, and by Strabo, and proposes a number of identifications; see *Academy* of July 1 (vol. iii. p. 258).]—VII. An Account of Jerusalem, translated from the Persian text of Násir ibn Khusrú's *Safarnámah*, by the late Major A. R. Fuller. [The author was a native of Merv, who visited the Holy Land and Egypt in the eleventh century of our era. He states that he entered Jerusalem on the 5th of Ramazán 438 A.H. There occurs in his narrative a brief description of the Holy Temple. Of the original text of this work, two MSS. exist in England, one of which is in the British Museum, the other belonging to the Nawab Ziaud-din Khán.]—VIII. The Poetry of Mohamed Rabadan, of Arragon; by the Right Hon. Lord Stanley of Alderley. [The concluding portion of the Morisco poet Mohamed Rabadan's *History of the Prophets*.]—Annual Report on the Progress of Oriental Research during the Past Year, and the State of the Society. Read on June 3 last.

### POSTSCRIPT.

Dr. Brockhaus, the eminent Orientalist, has been appointed Rector of the High School at Leipzig. His inaugural address was on the bearing and importance of Oriental studies.

The eminent mathematician, Alfred Klebsch, has just died at Göttingen, at the early age of 40.

(From the *Athenaeum*.)

### MR. VLADIMIR DAHL.

Again we have to announce the death of a distinguished Russian writer. It has too often happened that a literary career in Russia has been prematurely closed in the grave; and within the last twelve months three of the most useful of Russian scholars, Afanasief, Hilferding, and Pekarsky, have died in middle age. But Vladimir Ivanovich Dahl, whose death we have now to record, had attained a good old age, and so was able, before he was called away, to see his work brought to a full and happy conclusion. Born in 1802, of Scandinavian extraction, Vladimir Dahl was educated in the Naval Cadets' Institution at St. Petersburg, and he afterwards served on board the Black Sea fleet. At a later period he held a commission in the Russian army, and served in the Polish campaign of 1831. Having studied medicine at Dorpat, he filled a medical post in one of the Government hospitals at St. Petersburg, and finally he obtained an appointment in the Civil Service. But it was as a student of its popular literature that he made himself most useful to Russia. So diligent was he as a collector of Russian folk-lore that he was in possession of above 4,000 popular tales, besides more than 30,000 proverbs. The latter he published in a separate volume; the former he liberally communicated to other scholars, and many of them now enrich the great collection edited by Afanasief. As an author he gained a considerable reputation by various works, such as the stories he published under the pseudonym of the "Cossack Lugansky." But his great work—that which will render his name truly immortal—is the invaluable *Dictionary of the Living Russian Tongue*, in four large volumes, which was completed in 1866. It is impossible to praise too highly this magnificent work—one to which he devoted, during a great part of his lifetime, what was most truly a labour of love. For the present, it is sufficient to say that to all who wish to study the popular literature of Russia it is an absolute necessity. Without its aid the songs and stories of the Russian people will offer difficulties trying even to a native, to a foreigner insurmountable.

For some time before his death Mr. Dahl suffered much from illness, but he retained to the last his interest in the work he had so long loved. When the writer of this brief notice last saw him, he was, although in evidently ailing health, full of intellectual vigour and enthusiasm. Surrounded by his books, in a home which was more like a country-house than a city residence (it stood in the outskirts of Moscow, near the Zoological Gardens, and was said to be the only building in that quarter of the city which had survived the famous conflagration of 1812), he spent the declining years of his life in tranquillity, having the satisfaction of seeing his literary harvest safely garnered and fully appreciated.

W. R. S. R.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 61.

Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.

The Editor cannot reply to questions from authors respecting the notice of their books.

The next number will be published on Monday, December 16, and Advertisements should be sent in by December 11.

## General Literature.

*Shelley's Early Life*; from Original Sources. With Curious Incidents, Letters, and Writings, now first published or collected. By Denis Florence Mac Carthy, M.R.I.A. Hotten.

THE main object of this volume is to set forth the facts of Shelley's life, as connected with his journey in 1812 to Ireland, where he advocated Catholic emancipation, and more especially repeal of the Union. Mr. Mac Carthy made this subject his own many years ago; and whatever has been said since then by other writers, with some approach to detail or accuracy, has been due very principally to him. He has now carried the investigation much further, enlarged upon the facts, rectified a number of small or less small errors, and shown with some completeness the true bearings of this episode in an illustrious life.

The volume consists of two classes of subject-matter—one which is proper to Mr. Mac Carthy himself, and the other to Shelley. The latter consists of Shelley's various political pamphlets: the *Address to the People of Ireland*, the *Proposals for an Association of Philanthropists* for the benefit of Ireland, the *Declaration of Rights*, the *Proposal for putting Reform to the Vote throughout the Country*, and the *Address to the People on the Death of the Princess Charlotte*. The last two do not exactly belong to Mr. Mac Carthy's theme; but all Shelleyan students will be obliged to him for having added them, and so made the collection of Shelley's strictly political pamphlets complete. They are all rare, if we except the *Declaration of Rights*, which, having been republished in the *Fortnightly Review* by the present writer in 1871, has become accessible to all readers. The *Address* concerning Princess Charlotte had also been reprinted, and is less scarce than the others, which very few people had ever seen, and which were practically unattainable. By far the best of these is the *Reform* pamphlet, written in 1817, when Shelley was about twenty-five years of age. The two Irish pamphlets, written in 1812, are tedious and inflated productions, though it cannot be said that they are devoid of sound advice, while, for generosity of spirit and high-souled scorn of oppression, they are naturally conspicuous. The earlier of the two effusions, the *Address*, full of lumbering repetitions, was purposely written down to the capacity of the uninformed classes of Irish people: if it hereby gains in clumsiness, at least it loses somewhat in bombast; but the *Proposals for an Association of Philanthropists* make up for all arrears in this direction. There are two other pamphlets by Shelley which ought to be rescued from oblivion; but, not being of a political character, they could hardly, under any circumstances, have found a place in Mr. Mac Carthy's book. The first of these is the *Refutation of Deism*, pub-

VOL. III.—NO. 61.

lished in 1814: Mr. Mac Carthy seems to suppose that no copy of this dialogue is now known to be extant, but there is at least one, in the possession of Sir Percy Shelley. Its precise object (I am told by a gentleman who has looked into it) is to show that there is no tenable medium between Atheism and Christianity, coupled with an ironical championing of the latter. The second of the two tractates referred to is the *Essay on Devils*, never yet published, but existing in manuscript, or perhaps even in print.

The reprint of Shelley's pamphlets in Mr. Mac Carthy's volume occupies 98 pages out of 408. The remaining 310 pages have as their nucleus one fact, which is indeed the chief contribution to Shelley's biography furnished by this book—viz. that the poet, while still at Oxford in 1811, published in London a poem termed *A Poetical Essay on the Existing State of Things*, "sold by B. Crosby and Co., and all other Booksellers." It was advertised as "By a Gentleman of the University of Oxford" (the same phrase as in the title-page to Shelley's novel of *St. Irvyne*), "for assisting to maintain in prison Mr. Peter Finnerty, imprisoned for a libel": its price was two shillings. An advertisement to the foregoing effect appeared in the *Oxford University and City Herald* of 9th March 1811. The evidence that the poem thus advertised was by Shelley is merely inferential, but may nevertheless be regarded as sufficient. It is simply this: that the *Dublin Weekly Messenger* of 7th March 1812, at which time Shelley was in Dublin, contained an article about him, written in all probability by the well-known political agitator John Lawless, wherein occurs the following passage: "Mr. Shelly, commiserating the sufferings of our distinguished countryman Mr. Finnerty, whose exertions in the cause of political freedom he much admired, wrote a very beautiful poem, the profits of which, we understand, from undoubted authority, Mr. Shelly remitted to Mr. Finnerty: we have heard they amounted to nearly an hundred pounds." Mr. Mac Carthy fairly argues that, as Shelley sent to Godwin this number of the *Weekly Messenger* without in any way controverting the statement which it contained affecting himself, he practically confirmed its truth. Our author therefore made zealous research for anything to explain or verify the allegation in the Dublin paper. At last he traced out the advertisement above referred to in the *Oxford Herald*, and putting the two things together, he comes to the firm and, I think, the safe conclusion that the writer of the *Poetical Essay on the Existing State of Things* was Shelley. Of the poem itself, however, Mr. Mac Carthy has not, after extensive and reiterated enquiry, succeeded in obtaining the least vestige. He tells us who Mr. Finnerty was—an Irish printer and press writer and reporter, who, after suffering the pillory and imprisonment as printer of *The Press* newspaper in Dublin, endured another incarceration of eighteen months in Lincoln Gaol for an alleged libel on Lord Castlereagh. He was undergoing this sentence at the time that Shelley came forward on his behalf: and he died on the 11th of May 1822, only a couple of months before the author of the *Poetical Essay* and of many other less perishable verses.

Mr. Mac Carthy is entitled to the whole credit of ferreting out the *Poetical Essay*, and identifying it with Shelley as author: but he goes a little too far in assuming, as he appears to do throughout his book (and especially on p. 4), that no hint had ever before been given of the publication by Shelley of any poem to which this volume is found to correspond. In the memoir of Shelley (p. xli) which I published in an edition of his works at the beginning of 1870, there is a note which says: "Everything that is known on this subject [the volume named *Original Poetry by Victor and Cazire*, printed in 1810] is due solely to Mr. Garnett:

see his article in *Macmillan's Magazine*, June 1860, *Shelley in Pall Mall*. He has kindly informed me, moreover, that a gentleman connected with the Shelley family says that Percy 'wrote and printed *another* book of verse about the same time. He could not remember the title, but thought a copy might still be in existence.' This "other book of verse" must, to all appearance, be the *Poetical Essay*; for even the unwearied and minute researches of Mr. Mac Carthy regarding this period of Shelley's life have not brought to light anything else to which the statement could be supposed to apply.

Next to this of the *Poetical Essay*, the most important point brought out in the volume before us is that Shelley's Oxford friend, Mr. Thomas Jefferson Hogg, so far forgot himself as to make love to Harriett Shelley (late Miss H. Westbrook) very soon indeed after being first introduced to her, and consequently very soon after Percy and Harriett had become man and wife; and that this discreditable escapade, which occurred in York in October 1811, caused a total estrangement between Shelley and Hogg for about a year ensuing. Mr. Mac Carthy, it is true, does not state this matter in absolutely plain and unmistakable terms: he does not give the name of Mr. Hogg at the decisive moment (p. 300), but only refers to "one of the earliest chosen and the most boastful of the number" of Shelley's friends. However, putting together this passage and various others in the volume, there can be no mistake as to what Mr. Mac Carthy means. Moreover, I am aware that what he thus intimates is based upon very explicit statements in letters written at the time by Shelley, which I had myself read through before completing my memoir of the poet; and Mr. Mac Carthy best knows what chance he would have had of tracing them out through his own unaided endeavours. The many extracts which he gives from letters addressed by Shelley, and occasionally by Harriett, to Miss Hitchener, and which form perhaps the most valuable and entertaining portion of the present volume, all come from this correspondence. The revelation now made by Mr. Mac Carthy concerning a friend who "attempted to seduce my wife" (to cite the precise expression in Shelley's letter to Miss Hitchener) may explain to the reader of my memoir of Shelley what was meant by a passage, purposely reticent, in a note (p. lxxv): "I have good reason to know that, at an earlier period of his wedded life, his disrespect for the marriage tie was by no means such as to make him tolerant of conduct which he regarded as an interference with its obligations in his own and Harriett's case." Again, the explanation which Mr. Mac Carthy offers (p. 117) of Shelley's Wertherian prose fragment, connecting it with this same affair of Hogg and Harriett, amounts simply to the suggestion which my memoir contains (p. clxxiv): "In this year [1813], or perhaps earlier, he commenced a sort of variation of Goethe's *Werther*, from which Hogg gives an extract. An accomplished Shelleyite has suggested to me that this excerpt (a letter purporting to be written to Werther by the husband of Charlotte) may be less merely Wertherian, and more directly personal to Shelley himself, than Hogg allows the reader to infer. Without adopting this view of the matter, I recognise it as admissible: if it is correct, the fragment probably belongs to the end of 1811, or beginning of 1812." A word should here be added as to the question of Mr. Hogg's real culpability in this matter of love-making to Harriett. As before stated, it is most certain that Shelley charged him with attempting to seduce her, and also with inciting the poet himself to fight a duel, and so save the wounded honour of both parties: but we are not obliged, nor indeed allowed, to take Shelley's conception of the facts, in all instances, as a true picture of them. Shelley

apparently knew nothing of the affair save what Harriett told him, eked out perhaps by not over-friendly confirmatory hints from her sister: he does not seem to have come to any personal explanation on the subject with Hogg, but only to have interchanged letters with him about it: and it is extremely conceivable that Hogg, as soon as he perceived Shelley to be grave or warm on this delicate topic, turned bantering and elusive. If we suppose—what is abundantly probable—that the inexperienced school-girl Harriett exaggerated a little in narrating to Shelley the passages of a flirtation got up by the cynical young man from the University, and—what is practically certain—that Shelley's imagination was not behindhand in making a blaze out of such suitable fuel supplied to it by Harriett, we shall conclude that "attempted seduction" of the latter is not proved against Hogg—although it is difficult to doubt that his conduct was rightly open to animadversion and suspicion.

Two other interesting points which Mr. Mac Carthy has been the first to elicit relate to Shelley's Oxford career. He has found that the pamphlet which led to his expulsion from the University, *The Necessity of Atheism*, was announced for publication and sale—not merely, as had hitherto been supposed, circulated in a semi-private way by himself. The following advertisement appeared in the *Oxford University and City Herald* of 9th February 1811: "Speedily will be published, to be had of the Booksellers of London and Oxford, *The Necessity of Atheism*. 'Quod clara et perspicua demonstratione caveat pro vero habere mens omnino nequit humanæ.'—*Bacon de Augment. Scient.*" [It is obvious here that "caveat" and "humanæ" are misprints for "careat" and "humana": whether the misprints occur in the advertisement itself, or in Mr. Mac Carthy's reproduction of it, I am unable to say.] Further, Mr. Mac Carthy has found that, about the time of Shelley's stay at the University, and not beyond that time, six pieces of verse, original and translated, appeared in this same paper, *The Oxford Herald*, some of them signed "S." and others "Versificator," and he surmises that these may be by Shelley. He extracts these effusions, and rather strongly pronounces for the Shelleyan authorship of the one original specimen, named *Ode to the Death of Summer*: a conclusion as to which I should take leave to dissent from Mr. Mac Carthy, as the poem does not appear to me to resemble, in any marked degree, those which Shelley had composed up to that date, and still less the immortal products of his maturer years.

Partly perhaps on account of the affair with Harriett Shelley, already referred to, Mr. Mac Carthy exhibits a great dislike of Mr. Hogg, and a total contempt of his *Life of Shelley* as an authority: nor, indeed, has there been any time, since the date of the publication of that most diverting book, when its gross inaccuracy in detail, and its recklessly overcharged portrayal of facts, could be matter of uncertainty. Mr. Mac Carthy is especially severe on the slighting account which Hogg gave of the whole of Shelley's Irish expedition, including the statement that the poet was howled down by Roman Catholics at a public meeting when he urged on their consideration the rightful claims of Protestants. In all this matter Mr. Mac Carthy corrects many details, and elucidates many more, some of them of substantial interest: but, on the other hand, he seems himself a little too much inclined—accepting as he does the various statements favourable to Shelley's oratorical efforts in Dublin, and to his Catholic auditors—to ignore all allegations that tell in the opposite direction, even though these may not involve any real contradiction of the other assertions, but only supplement and modify them. Sometimes the author's antipathy to Mr. Hogg makes him positively unjust to that writer, whose permanent and deep regard for Shelley ought not to

be called in question, whatever may have been the misdeemeanours of his youth, or the partly sarcastic (as well as partly enthusiastic) tone of his biography. Mr. Mac Carthy cites the expression of Hogg, "I cannot but confess that the poor fellow [Shelley] had many underhand ways"; and he adds, "The underhand ways here referred to may perhaps mean those opinions on the character and conduct of Mr. Hogg himself which, though unpublished, still exist in the handwriting of Shelley." This is wholly gratuitous, and, were it not probably the result of oversight, must be called most unfair and malicious. The fact is that Hogg has no sooner spoken of Shelley's "underhand ways" than he explains his meaning thus: "I should add that his underhand ways differed in one very important respect from those of other people. The latter were concealed because they were mean, selfish, sordid,—too bad, in one word, to be told: *his* secrets, on the contrary, were hidden through modesty, delicacy, generosity, refinement of soul,—through a dislike to be praised and thanked for noble, disinterested, high-minded deeds, for incredible liberality and self-sacrifice." Thus we see that Mr. Hogg, under an ironical phrase, only paid a very high tribute to his friend's memory in this instance.

The same habit of picking one sentence out of a whole passage, and consequently mis-stating the result, has produced an erroneous charge by Mr. Mac Carthy in my own case. On pp. 338, 339, he refers to the statement of Captain Medwin that Shelley, having left Ireland for the Isle of Man, and sailing thence in November, took a principal part in saving the vessel from a storm. He points out the inconsistencies of this narrative, and then proceeds: "And yet this absurd story and these unfounded statements have been repeated with a sort of parrot-like iteration by every subsequent writer who has undertaken to give us an account of Shelley's life,—except, indeed, Mr. Hogg, who generally commits himself to no one's nonsense but his own. They are adopted without the slightest hesitation by Lady Shelley and Mr. Rossetti." Now, my memoir of Shelley (p. lxvi) speaks of the matter in the following terms: "They experienced a storm near the Isle of Man, when Shelley, in the judgment of the skipper, who would receive no payment from him, saved the ship and its crew of three by his energetic and judicious exertions." To this very passage is appended the ensuing note: "It is not quite clear *when* this incident happened. Medwin (*Life*, vol. i. p. 177) says it was in November, and after the *first* Dublin sojourn; in the *Shelley Papers* he says it was in 1813 or 1814. If it was really in 1813, it must have been in going to or returning from the *second* Dublin sojourn. It cannot have been in 1814, nor yet in the month of November. Perhaps the whole story is apocryphal." This is a strange specimen of "parrot-like iteration," and of "not the slightest hesitation." The citation of this passage, and of that from Mr. Hogg's book, may perhaps suggest to Mr. Mac Carthy a little more caution in pronouncing other people to be in the wrong: although, as I have already said, he has undoubtedly corrected several errors of detail appearing in preceding accounts of Shelley, mine included—for which I am heartily obliged to him.

The solution offered by Mr. Mac Carthy of the alleged attempted assassination of Shelley at Tanyrallt, in February 1813, appears to me altogether extravagant. He thinks that Miss Hitchener (the schoolmistress from Hurstpierpoint who had recently been an inmate of Shelley's house, and whom he had now parted from, and termed "The Brown Demon"), or Miss Hitchener's father, may have been at the bottom of it. The father, it seems, was a publican near Hurstpierpoint, who had in his earlier years been a smuggler,

and whose real surname was Yorke. Shelley engaged to make some pecuniary allowance to Miss Hitchener after she had left his house: but Mr. Mac Carthy *conjectures* that this promise may have remained unfulfilled, and that Miss Hitchener or her father, after expostulations and threats, may have prompted some one to undertake an illegal *coup de main*. Considering the distance between Hurstpierpoint and Tanyrallt, and all the other circumstances of the case, it appears to me that if we term Mr. Mac Carthy's solution of the mystery "not impossible," we treat it liberally. I may take this occasion to mention a fact not apparently known to writers about Miss Hitchener—that she too was a "poetess," though of rather a different class from Percy Bysshe Shelley. In 1822, Messrs. Black, Young, and Young, of Covent Garden, published *The Weald of Sussex, a Poem by Miss E. Hitchener*. It has no literary value, though there is a certain display of erudition in the poem and its notes: it shows that by 1822 Miss Hitchener had ceased to profess herself, as in the early days when Shelley so fulsomely and fatuously adored her, a "deist and republican."

Mr. Mac Carthy's book is not very easy for consecutive reading, as there is a good deal of repetition in it, and some scattering of its constituent elements, and a tendency towards making the utmost of every minute point that it raises—and not many of the points are of major importance. It is, however, a laborious and a thoroughly genuine accession to the biographical materials regarding Shelley, and will remain indispensable to all students of this period of his life.

W. M. ROSSETTI.

#### RUSSIAN FUNERAL LITERATURE.

Laments of the Northern District. [*Prichitaniya Syevernago Kraja.*]  
Collected by E. V. Barsof. Vol. I. Moscow.

IN the north-east of Russia, especially in the neighbourhood of Lake Onega, the collectors of popular songs and stories have of late years found very much that is interesting and valuable. Thence have been drawn, to a great extent, the ample materials which have rendered so rich the collections of "metrical romances" and other poems due to the patient toil of such explorers as Ruibnikof and Kiréefsky. To the name of a third labourer in the same field, unfortunately, a mournful interest is now attached. Alexander Hilferding, the president of the ethnographical section of the Russian Geographical Society, was on the point of publishing the mass of popular poems which he had secured in that part of the country, when he started, a few months ago, to explore the district a second time. At Kargopol fever struck him down, and before many days had passed, he was laid in an untimely grave.

Of the poems which are current among the unlettered peasantry of this part of Russia, by no means the least interesting are the *prichitaniya*, or "lamentations," which are to be heard on the occasions of deaths, funerals, and festivals held in memory of the dead. Specimens of these have been given at various times, and in Ruibnikof's great work there occur, under the name of *saplachki*, or "wailings," several of these dramatic dirges or keenings, remarkable for a singular kind of power as well as pathos. But no comparison can be made between any preceding collection of such poems and that for which we are now indebted to M. Barsof. His work is the first which has been entirely devoted to this branch of Russian popular poetry—one of which he has most satisfactorily proved the great importance.

Considerable time and space would be required to give anything like a clear idea of the merits of the poems which

fill 298 pages of this, the first, volume of M. Barsof's work. But it is possible to compress into a small compass some of the remarks which he makes in the excellent introduction which he has prefixed to them, and in the interesting account of funeral customs by which they are followed.

After mentioning some of the countries in which keenings and professional keeners have been and still are in vogue, M. Barsof proceeds to trace in the old chronicles the earliest record of their existence in Russia, proving, on the authority of Nestor, that *plachi*, or "laments," formed in Olga's time an indispensable part of the *trizna*, or "funeral feast," of the old Slavonians; showing how, when Oleg died, "all the people wailed over him with great lament," dwelling upon the "beautiful wail of Yaroslavna" in the celebrated poem, *On Igor's Expedition*, and quoting from the lives of the (Russian) saints and other ancient records several extracts from funeral poems composed many centuries ago, but differing little from the metrical complaints in which the borderers on Lake Onega at the present day express their feelings towards their dead. Then he shows how the church attempted to put a stop to the use of such funeral chants, on account of the heathen sentiments which they breathed, sometimes even branding them with the name of "satanic songs," objugating them in sermons, and solemnly prohibiting them by the voice of the council held at Moscow in 1551. But neither the influence of the church nor even the power of Peter the Great was sufficient in this matter to bend the will of the people. Beside the bodies or above the graves of their dead relatives and friends the peasants insisted on indulging in their wonted expressions of grief; and so the old songs which had come down to them from the days of their ancestors continued to be sung in at least all the remoter parts of Russia. Of late years, however, they have lost much of their hold upon the affections of the people in general, and in order to hear them in perfection it is necessary to visit such outlying districts as those in which M. Barsof sought and found the materials for his work.

Much is to be learnt from these archaic poems with respect to the views of the old Slavonians about this life and that beyond the grave. In them Death is represented as a foe, who makes her appearance (*Smert* = *Mors* being feminine) in various guises. In vain does man attempt to struggle with her, and rescue from her grasp the beloved victim; at one time as a raven or a hawk, at another as a fair maiden or a crippled beggar, she glides into the doomed dwelling and cuts the thread of life. Vainly also is she beset by expostulations and tempted by promises; utterly inflexible she strikes the fatal blow. Sometimes, indeed, she (or Fate) is represented as enjoying the sufferings of her prey. As in all poems of this class, the action of dying is compared to the setting of the sun, the falling or disappearance of a star, the melting of snow, and the like. The actual moment of dissolution is held specially sacred, and it is the bounden duty of a relative or friend to watch beside "the painful couch," the "weary pillow," to keep guard while "the bright eyes are parting for ever with the white light," the soul is going forth from "the white breast." Bitterly do the wailers grieve over those corpses by which no watchers have sat at the last moment. The departing soul is sometimes described as a breath which is borne away by the winds, or, under the influence of Christian ideas, is received by one of the angelic host; sometimes it is pictured as a butterfly or a bird. The ideas expressed in the poems with reference to the existence of the disembodied spirits are of a twofold nature. Sometimes the soul is supposed to dwell in the grave, and so the carpenters who are constructing the coffin for a corpse are besought to make it a comfortable dwelling-place for its late tenant; at other times it is described as flying

together with other spirits among the clouds. But wherever their regular habitations may be, the souls of the dead are believed, and even expected, to appear to the living. Some traces may even be found, M. Barsof thinks, of a family *cultus* of the dead, and he quotes, as an instance, the lament which is sung by the dead man's kinsfolk, when they go through all the house and the outhouses which had belonged to him, as if expecting to find him in some part of his wonted home. So closely is the idea of the house-master connected with that of the Domovoy or house-spirit that, "if you say, 'I have seen the Master' (*Khozyain*), every *Zaone-zhanin* (Beyond-Onega-Man) will think you mean that you have seen the Domovoy."

From these poems, says M. Barsof, an interesting picture of the hard life of the North might be constructed. In them may be seen, as in a mirror, the monotonous landscape, the gloomy forest, the dreary swamp, the scanty vegetation; in them also are portrayed the simple folk who have to maintain so constant a struggle with the forces of nature, their picturesque dress, their old-fashioned habits and customs. Of especial interest are the passages which refer to the family relations in the patriarchal mode of life which prevailed when their songs were originally sung, and which, in some respects, has not yet been materially altered. Each degree of relationship demands its own particular wail, and so we find special forms of lamentation, not only for parents and children, or brothers and sisters, but also for uncles, aunts, nephews, nieces, godchildren, first-cousins, first-cousins-once-removed, &c. Very interesting also are the poems which throw light upon the relations of the peasants with their communal authorities, or with the upper classes of officials and the clergy, of which nature are the laments for a *Starosta*, or village chief, or for a "pope," or a doctor, or for a *Mirovoi Posrednik*, or official arbiter. And no less interesting are the laments of a different kind, those devoted to persons who have been drowned, or struck by lightning, or who have committed suicide.

Over M. Barsof's most interesting account of the Olonets funeral customs we must now skim very hastily. Many of them are exceedingly remarkable, such as that of leaving openings, in which glass is sometimes set, in the coffin; that of placing in the coffin cuttings from the hair and the nails of the corpse, and also such things as bread, needles, and so forth; that of using as a remedy against ague the soap with which a dead body has been washed; that of (sometimes) singing wedding songs at the funerals of young girls, and many another of equal interest. His descriptions, also, of the funeral banquet and the memorial feast are most valuable, and so is the comparison he draws between the memorial festivals of the Olonets Slavonians and those (of a very similar nature) observed by the Ugrian Mordvins.

With an amusing description of the various *Voplenitsas*, or professional wailers, from whom he derived a great part of his valuable materials, and with "a North Russian glossary, together with general remarks on the language of the *Prichitaniya*," M. Barsof concludes the first volume of a work for the execution of which he deserves high praise, and which is of the greatest interest to every student of folk-poetry and of folk-lore.

W. R. S. RALSTON.

#### LITERARY NOTES.

*Enigmas of Life*, by W. R. Greg (Trübner and Co.), is a book which deserves some attention as showing in a convenient compass how much—or how little—can be done in the way of constructive speculation without a foundation of fixed scientific principles. Mr. Greg is a reformer who believes in the perfect-

ibility of the species, while taking a very gloomy view of its actual estate; and a sceptic who cherishes some articles of faith which he knows to be uncertain. In his first essay, on "Realisable Ideals," he omits to explain whether by "possibilities" he means logical and mechanical, or what may be called historical, possibilities; and as the latter only can (and certainly will) be realised, his optimistic inferences lose a part of their weight.—Essays II. and III., "Malthus Notwithstanding," and "Non-Survival of the Fittest," discuss two aspects of the population difficulty, and in the interests of the moral and physical perfection of the race argue in favour of adjourning the theory and practice of Malthusianism until the whole of the habitable globe is evenly peopled with scientific farmers.—Essays IV. and V., "On the Limits and Direction of Human Development," and "The Significance of Life," suggest the doubtfulness of everything except the existence of good, which is treated more as an axiom than as an hypothesis, though the surrounding atmosphere is so sceptical as to warrant the assumption that the writer would not assert more than his own power of imagining a world which he himself would think excellent.—"De Profundis" and "Elsewhere" carry this subdued optimism a little farther, and develop the assumptions, which an interesting preface aims at justifying, of the existence of a Creator and a Future Life. Mr. Greg writes for those who look upon both as doubtful, and merely asserts his own belief as a fact, claiming a right to hold it till the negative is proved. He is severe upon the unphilosophic materialism of the Christian doctrine of the resurrection of the body, though it is certainly not from modern science that he acquired the counter conception of a life "elsewhere" for disembodied spirits. His argument is that human bodies are known to decay, and that their elements pass into fresh combinations, so that at the Last Day there might be thousands of claimants for a single particle of matter. But a materialist finds it least impossible to conceive the resurrection of an individual consciousness by supposing all the old material conditions of its activity to be somehow or other re-united, and, given a Providence, surely it might be trusted to arrange that no two men should die in the possession of the very same fragment of flesh. The theory of transmigration is a *via media* which would allow the contending souls to re-occupy their bodies in turn. It would be unfair to complain of vagueness in the conclusions of a book which begins with the admission "... enigmas which, at thirty, I fancied I might be able to solve I find, at sixty, I must be satisfied simply to propound." But asking riddles is endless work unless it is first agreed in which language (faith, reason, or sense) the answer is to be given.—The volume contains an unusual number of printer's errors.

M. Émile Montégut's "Impressions de Voyages et d'Art" (*Revue des deux Mondes*, November 1) continue as readable as ever. At Citeaux the tourist learnt to understand the feud between the *gamay* and the *pinot*, the latter a vine growing on sunny slopes and producing the true *vin de Bourgogne*, the former a common "hypocritical" plant which ruins the fame of the nobler growth. The head of a reformatory for boys on the site of the old monastery assured him that the Parisian *gamins* were the most docile and corrigible. Beaune reminded him of Piron's satirical *Voyage à Beaune*, and Auxerre, which has erected a statue to Davoust, of several unpublished anecdotes which go to prove the marshal to have been more amiable than his reputation.

The *Cornhill* (December 1) contains a very happy appreciation of Nathaniel Hawthorne and the influence of his nationality on his genius. A suggested comparison with Charlotte Brontë illustrates the distance between his weird or airy fancies and the language of real passion or the delineation of intelligible character. A paper in the same number, on "Coincidences and Superstitions," borrows from the history of science some very curious instances of the former.

A new poem is announced by Julius Grosse (well known by *Das Mädchen von Capri* and other poems) under the title *Abul Kazim's Seelenwanderung*. It is supposed to be the narrative of a dervish, who describes his experiences in previous states of existence. The metre is that of Dante.

## Art and Archaeology.

Grimm's Life of Raphael. [*Das Leben Raphaels von Urbino. Italienischer Text von Vasari. Uebersetzung und Commentar von Herman Grimm. Erster Theil.*] Berlin: Dümmler.

HERMAN GRIMM's contribution to Raphaellesque literature is an instalment of a larger work. It comprises Vasari's life of Raphael, turned, we know not why, into modern Italian by Professor Tobler, and the same text conveniently divided into chapters, reprinted in Italic fragments and commented at considerable length. Grimm's purpose seems to be, at some future period, to write a biography of Raphael for which these commentaries shall be a book of reference, enabling him to dispense with notes and tell his story without further interruption. His views and arguments will, he doubtless thinks, have been exhaustively put, and the reader will thus take the benefit of a continuous narrative which—we may surely predict—will have more than the usual attractions of Grimm's manner.

The questions which prominently arise as we read this first volume of commentary are important. Does Grimm exhaust the materials, artistic and literary, at his command, and does he make such use of them as will preclude the necessity of commenting his own commentary?

None who peruse this work with a previous knowledge of the subject will deny the vast reading, the comprehensive grasp of sources, and the subtlety with which conclusions are drawn. It is striking with what clearness problems of perplexing intricacy are treated; and it may be admitted that there is a natural plausibility even in the solutions from which we feel bound to dissent.

Nothing appears more interesting, in our opinion, than the short but telling essays in which Grimm, with the help of engravings and photographs, sketches the gradual transformation of Raphael's compositions, from their first imperfect conception to their final completion. We note in the course of these excursions a judicious and close criticism enlivened and adorned by sparkling lightness of style.

Guided by a casual observation of the Abbé du Bos which escaped earlier research, Grimm is enabled to name almost all the figures in the "School of Athens"; and it is probable that he might have gone further had he not been restrained by considerations which have since been ably combated by Scherer.\* Sidonius Apollinaris and Marsilio Ficino's *Plato* are the true and only sources from which Raphael's literary friends derived the subject of the "School of Athens"; and it will be difficult for future writers to contend that this vast and noble composition contains a single figure connecting the philosophers of Greece with the apostles and fathers of the Christian faith. We think, indeed, that here it will be necessary for Grimm to surrender his position as a trimmer between two different schools and to assert a decided and final opinion of his own.

There is much again that commands attention in the parallel, frequently drawn, between Raphael and the heroes of the Tuscan schools of his time, Lionardo, Fra Bartolommeo, and Michael Angelo; for though here and there something might be brought forward to modify his views and bring his thoughts into a different channel, his opinions might be maintained with very little further expansion or modification.

On one or two questions of moment, it may be necessary to express the belief that Grimm will not be precluded from the necessity of making concessions, and we may be deliberately compelled to assert that it is impossible for a

\* W. Scherer's *Ueber Raphaels Schule von Athen* (22 pages, Vienna, 1872) has an important complement to this volume of Grimm's commentaries.

student of Raphael to accept the assumption, ably though it be argued, that Raphael did not visit Florence before 1506.

No doubt it is proper and necessary to contest the accuracy of Vasari when he relates the causes of Raphael's first journey to Florence, and the manner in which he was led to make it; but it is quite another thing to deny that the journey took place. As early as the middle of the fifteenth century the most intimate connection existed between the painters of Perugia and those of Florence. There was not an artist of mark in the first who was not perfectly informed of the commissions entrusted to craftsmen of the second. There was no road better known than the road from Perugia to Florence, which had been frequently travelled by Domenico Veneziano and Fra Filippo Lippi. It had been hinted to Perugino on the very threshold of his career that Florence was the only city in which an artist could rise to fame; and he had been to Florence, where he caused his name to be respected. At the very time of which we are treating he had been induced to revisit the Tuscan capital, where Michael Angelo's "David" lay finished and waiting for a pedestal. Da Vinci, too, had returned to Florence from Milan, and had partially completed the noble cartoon which was copied at a later period by so many students. What more probable than that the causes which induced Perugino to leave Perugia should lead Raphael, his pupil, to quit Sienna?

Vasari says that, when Perugino went to Florence, Raphael left Perugia for Città di Castello, where he painted three pictures, including the Dudley "Crucifixion" and the "Sposalizio" of the Brera. He then proceeded to Sienna, and took service with Pinturicchio, for whom he executed certain drawings. His connection with Pinturicchio was broken off because he had heard of the completion of cartoons by Lionardo and Michael Angelo. It is quite as natural to suppose that Vasari was ill informed of the causes which led Raphael to Florence as it is to conceive that Raphael painted the pictures of Città di Castello at Perugia. We can easily prove that da Vinci's "Battle of Anghiari" was not finished till 1506; and Grimm gives good, though not absolutely convincing, reasons for concluding that Michael Angelo did not allow his cartoon to be seen till 1508. But putting this aside, there may have been reason enough for Raphael's desire to visit Florence, if we only suppose him cognisant of Perugino's presence there. He might have learnt from Perugino himself that Lionardo was composing his grand subject for the public palace; and he might expect facilities for seeing the masterpiece in its unfinished state from a man who was da Vinci's friend, and had been his companion in Verrocchio's shop. He had doubtless heard—as who had not?—of the commotion caused by the question how the "David" of Michael Angelo should be moved from its place in the sculptor's studio to where it was in future to be exhibited, for this was a question which had occupied the mind of every one in Florence; and it is notorious that it led to a general congress of artists in the early part of 1504. Why, then, should he not have gone to Florence?

Perugino was at Florence in 1504. He was there with slight interruptions till 1506. It was then that Lionardo gave up to him the commission which he had accepted from the brethren of the Santissima Annunziata de' Servi to complete the "Crucifixion" unfinished at the death of Filippino. Is there any reason to doubt that Raphael might have been in Florence in 1505, when we know that his predella of the "Madonna of Sant' Antonio" (1505) comprised an improved version of the very group of the Virgin and her succouring women which was introduced by Perugino into the "Crucifixion" of the Servi? But this is not all the evidence

which may be adduced to strengthen the belief that Raphael was at Florence in 1505.

It is an error of Grimm to suppose that Raphael furnished the designs for the frescoes executed by Pinturicchio and his assistants in the library at Sienna as early as 1502. There is testimony to prove that the ceiling of the library, in which Raphael had no share, was begun and completed by September of 1503; that the work was suspended on account of the death of Pius III., and resumed at the close of 1504. In 1504, no doubt, Raphael was with Pinturicchio at Sienna, for the names of both painters are connected with one of the most curious incidents which illustrated the public life of those days at Sienna. Julius II. had put Sienna under interdict, and Pandolfo Petrucci dared to deride the pope's authority. A chapel, recently founded in San Francesco of Sienna, had been completed at the expense of the Piccolomini; it was adorned with a Nativity by Pinturicchio, resting on a predella by Raphael. The time was the beginning of November, when all the wealthy citizens had left their summer residences and settled in town for the winter; but the churches were closed; the bells no longer called the faithful to prayer, and an Oriental stillness lay upon the streets and towers. Pandolfo ordered the canons of St. Francis to celebrate the mass at the altar of the Piccolomini; and, on their refusal, he drove the priests by force to the altar. It was probably after the memory of this incident had begun to fade from the minds of the Siennese that Raphael made for Pinturicchio the designs with which he now began to decorate the Piccolomini library. But then Raphael was free to go to Florence; and to Florence we may believe he went; for there is not a single picture of all those which he executed in 1505 which does not prove that he had seen the works of Masaccio, Lionardo, and Fra Bartolommeo.

It is quite in vain that Grimm denies this influence in the "Madonna" of Sant' Antonio, which is not, as he believes, at the Louvre, but in the National Gallery; and it is impossible to disagree with Waagen when he maintains that the free attitudes, the natural breadth of extremities, and the bold sweep of draperies in the foreground figures of St. Peter and St. Paul as conclusively reveal the lessons derived from Fra Bartolommeo as the female saints, Catharine and Rosalia, display the working upon Raphael of Lionardo's style.

Equally vain is the effort to deny the presence of Florentine elements in the wonderfully clear tones and admirably rounded flesh of the principal figures in the Ansidei "Madonna" at Blenheim.

Grimm says he cannot conceive how the "Madonna del Gran Duca" can be registered amongst the pieces which Raphael produced before the Ansidei "Madonna." We may not be able to understand how Grimm can be blind to the Florentine breadth and treatment in the fresco of San Severo; and there may be reasons which it is needless here to state why this splendid work should not be classed amongst Raphael's creations of 1505.

There are minor questions involved in the difference as to the true period of Raphael's first journey to Florence which Grimm naturally seeks to determine in his own favour; but here his endeavours are more of a negative than of a positive kind; and it is clear that, if he should be led to abandon his present theory respecting Raphael's movements from 1502 to 1506, he would have to alter these minor questions to some extent also. Whether he do this or not may be left to Grimm's choice. It is enough for the present purpose to have stated the grounds which exist for rejecting his theory.

One or two points more require but passing observation. Grimm accepts as a genuine Raphael the "Christ on the Mount" of the Maitland collection, which is now acknowledged to be by Spagna. He casually gives expression to

an opinion which is liable to be controverted, that the "Madonna" of Sant' Onofrio at Rome is by Lionardo da Vinci.

J. A. CROWE.

### ART NOTES.

The death of Théophile Gautier is a loss not only to Letters but to Art. For many years he contributed to the journals notices of the Salons, and a great variety of essays on artistic subjects. An article treating of his activity in this department is to appear shortly in the *Gazette des Beaux-Arts*. The *Chronique des Arts*, from which we quote, tells us that he was born at Tarbes, April 30, 1811. He came early to Paris, where he received his education in the Collège Charlemagne, after which he entered the atelier of M. Rioult, but, disgusted with the ill-success of his first attempts, he gave himself up to poetry, in which he achieved so brilliant a reputation.

M. Guédéonoff, the director of the Imperial Hermitage, has now printed the paper on the marble group attributed to Raphael, read by him on August 22 to the Academy of Sciences at St. Petersburg. The text is accompanied by two photographs, one from the work in question, the other from the plaster cast by Cavaceppi, existing at Dresden. The subject of the group is the well-known composition by Raphael of a Dead Child borne by a Dolphin (see *Academy*, vol. iii. p. 408). A repetition in marble, which was held for a long while to be the original work, was exhibited at Manchester in 1857, and pronounced by W. Bürger to be of no great beauty. This is smaller than the Dresden cast, and does not show signs of certain injuries which are proved by the cast to have existed in the original. It is not possible within the present limits to give full value to the facts and arguments which go to support the claim of the Hermitage example to priority and authenticity. Suffice it to say that it tallies exactly with the Dresden cast, which was formerly in the collection of Baron Mengs; that every probability is in favour of its having been the work restored and cast by Cavaceppi at Rome in 1768, when it was in the possession of M. de Breteuil; that between 1768 and 1779 it passed into the hands of a certain Mr. Browne (see Dallaway's *Anecdotes of the Arts in England*), who sold his collection of ancient marbles to an agent of the Empress Catherine II. It will be seen that there is a gap of 250 years to be filled up; that we are in nowise in a position to prove that the Hermitage example is the work which the Count Castiglione proposed to buy of Giulio Romano on May 8, 1523. Cavaceppi, in his catalogue of the works cast and restored by him, remarks of this group that it is by Lorenzotto, after a sketch by Raphael. It yet remains to be shown whether much or any credit should be attached to this hypothesis, or whether Raphael did much, or little, or nothing, towards the carrying out of his project.

We learn from the supplement to the *Zeitschrift für bildende Kunst* (October 25) that Signor Rosa's excavations in the Roman Forum have been crowned with the most brilliant success. About the beginning of September a portion of a Roman bas-relief was found at the corner where rises a middle-age tower. At two different portions of this tower (to which they appear to have served as supports hidden by other material) are now disclosed a row of portions of wall occupying from 12 to 15 metres, decked on both sides with costly sculptures, which have apparently served for the decoration of the rostrum. These marble reliefs would display to the eyes of the people standing below a historically arranged series of notable events having relation to the Forum. The position in which they have been found opens a fresh field to topographical conjecture and enquiry, whilst the reliefs are of the greatest importance, not only an account of their historical content, but on account of the brilliant quality of their execution, which appears to belong to the last bright epoch of Greek art in Rome. It is proposed to send the reliefs to the Vienna exhibition.

Amongst more recent publications in this department, the following appear to be worthy of special notice:—*La Colonne Trajane d'après le surmoulage extérior à Rome* 61-62; this work will be complete in 120 parts, 12 of which have been

already published; the text is by M. Froehner, the conservator of the Louvre, and is embellished by numerous vignettes; the plates, 220 in number, are printed in colour from photographs executed by Gustave Arosa.—*Kunstmythologischer Atlas*, by Professor Overbeck; the atlas is to accompany the Professor's *Griechische Kunstmythologie*, of which the first volume, "Zeus," appeared last year; it possesses claims to attention rarely united, for it is not only valuable from a scientific but from an artistic point of view. A liberal subvention from the Saxon government has enabled the Professor to present his work to the public in its present form. The gigantic size of the plates (3 feet by 2 feet) will, we fear, stand very much in the way of frequent and convenient use.—*Rom und Mittel-Italien* (2 vols.), *Ober-Italien* (1 vol.), by Dr. Gsell-Fels. These are not mere handbooks, but the outcome of zealous and scientific research. They are amply illustrated with plans and maps, and every portion of the text bears traces of individual study.—*Trésor de l'Abbaye de Saint-Maurice d'Agaune*; both the text and illustrations are by M. Édouard Aubert. This Swiss monastery has preserved its treasures intact. M. de Blagnac published a few of the works of art which it contains in his *Histoire de l'Architecture sacrée dans les anciens évêchés de Genève, &c.* The present magnificent work is accompanied by an atlas of 45 plates, engravings or chromolithographs, which reproduce their originals with the greatest exactitude.—*I Pittori di Foligno nel secolo d'oro delle arti italiane*; it is sufficient to say that this book comes from the pen of Professor Adamo Rossi, the great authority on the Umbrian school.

In the *Allgemeine Zeitung* of November 6, under the title of "Der Maierhof und der Augsbürger Rathsherr Philipp Hainhofer," will be found a very characteristic picture of the career of one of those artists who flourished from the end of the fifteenth up to the middle of the last century—artists who devoted their best energies to the designing of those objects which are best described by the expressive German word *Kleinkunst*. Hainhofer was born 1578 at Augsburg. There he settled and established his *Kunstkammer*, which was visited by princes. Amongst his correspondents he counted Henri IV. and the Markgraf Friedrich of Baden. The Maierhof was a costly toy executed for Duke Philipp of Pomerania, on which worked joiners, goldsmiths, watchmakers, stonecutters, modellers, engravers, &c. The design was by Hainhofer, and was intended to depict the life of the nobles, military affairs, and peasant life. The quantity of small objects required to carry out this elaborate piece of child's play was enormous, and its completion occupied five years, at the end of which Hainhofer sets out with it himself to Stettin, accompanied by Baumgartner, who had executed the joiner's work required. At Stettin, Hainhofer, already a rich man, was loaded with gifts, was named "herzoglicher Rath," and dismissed with letters of recommendation to the Bishops of Würzburg and Bamberg. The author of this curious sketch, Franz Trautmann, cannot refrain from drawing attention to the resemblance with a difference which exists between the story of Hainhofer's journey to Stettin and Dürer's journey to the Netherlands. Dürer came home a loser, and for all his noble work got from the Governess Margaret nothing; but the wealthy Hainhofer with his vain toy kindles the delight of princes, and obtains riches and honours.

A. von Zahn concludes in the present number of the *Zeitschrift für bildende Kunst* his notice on Barock, Rococo, and Zopf. Dr. Kinkel reviews Dr. Gsell-Fels' Handbooks for Italy. The number contains also a notice of the loan exhibition of ancient objects of industrial art now being held at Berlin, and a notice on the Vienna treasure chamber.

Very various articles are to be seen at the loan exhibition in Berlin mentioned above. The Crown Prince is said to have been active in getting together objects of interest; amongst many, all of which are worthy of notice, may be specially mentioned a fine Italian bronze bust of Sixtus V. which the Prince discovered in the picture gallery at Sanssouci. It is reported to be a masterpiece, and in its forcible expression of natural power forms a remarkable contrast to the delicate spiritualised head of Innocent X. which belongs to Prince Carl, and has been placed in the same room.

The collections in the museums of Paris are gradually assuming their wonted look. The MSS. have returned to the library of the Rue de Richelieu, the armour to the Museum of St.-Thomas d'Aquin, the precious goldsmith's work of the Musée des Souverains has found its way back to the glass-cases of Apollo Gallery. The bronze chair of Dagobert has been returned, together with the gold ornaments from the tomb of Tournay, to the Cabinet de Médailles. But the chalice of Saint-Remi, which was taken from the cabinet by means of a formal order of the Empress, has not been restored. The library since '96 has possessed this chalice without the library (says the *Chronique des Arts*); the chalice would have been melted at the Mint. The directors were careful, when forced to part with it, to make a memorandum in writing that they did so only as a loan: it is now the duty of the French government to see that the ecclesiastics of Rheims make a just restitution.

M.M. Colnaghi and Co. have recently published a set of seven etchings by Mr. J. C. Robinson, the former director of the Art Department at South Kensington, whose forced retirement from a position in which his controlling knowledge was so much needed has been and still is so much regretted. Very few will be prepared to find what a high position as an artist must be assigned to the author of these seven plates. The subjects are very various; some of the Spanish ones are perhaps the most remarkable where all is good. "Space and Light" is simply one of the most brilliant things of the kind that has ever been done.

The "Kitchen Interior," by Pieter Aartsens, commonly called Lange Pier, was one of the pictures which attracted most attention at the recent exhibition organized at Amsterdam by the society Arti et Amicitiae. The proud force of this robust and magnificent master was a revelation to the foreign public. We learn that the Brussels Museum has had the good fortune to secure this fine specimen of his work.

The Society of Arts at Lyons will open its annual exhibition on the 10th January 1873, and will close it on or about the 15th March.

M.M. Corot and Diaz have been named knights of the order of Leopold, on the occasion of the general Exhibition of the Fine Arts which has just taken place at Brussels.

### Physical Science.

A Treatise on the Theory of Friction. By J. H. Jellett, B.D.; Senior Fellow of Trinity College, Dublin. Dublin: Hodges, Foster, and Co.

FOR the experimental determination of the laws of friction between solids, we are mainly indebted to Coulomb. The investigations, also, of M. Morin into the nature and action of this force are of great value. The laws established by them, although only approximations to the truth, have been adopted by mathematicians as the basis of the analytical treatment of the equilibrium and motion of particles and bodies on rough surfaces. The most important of these laws is that of the proportionality of the friction to the pressure. With reference to this law the author states in his preface that "the adoption of a more complicated law would have greatly enhanced the mathematical difficulties of the theory, yet without giving results mathematically coincident with facts." Undoubtedly a more complicated law would have immensely increased the mathematical difficulties, and would probably render any but the most

simple problems insoluble; but it is not clear that the results obtained would fail in coincidence with facts. The theory, however, has so far received but little attention; and the space allotted to its development in most treatises on Rational Mechanics (a designation of the mathematical science used by Mr. Jellett) is extremely limited in comparison with that devoted to the solution of mechanical problems on the supposition of perfect smoothness. The consequence has been to cause many students to look upon friction as a force which, to a certain extent, lies without the province of Rational Mechanics, but which has to be taken into consideration whenever it is required to apply results obtained on the supposition of smoothness to practical questions. This neglect, moreover, probably causes a large number of students to regard Rational Mechanics as a matter of pure analysis, and to lose sight of the physical truths which the formulae represent. The author wishes by this treatise to establish the theory of friction in its proper place as a branch of Rational Mechanics, and to obtain for it a more ample discussion than has yet been given it. The work, which well supports the reputation of its learned author as a mathematician, is one well calculated to effect this, both from its logical and scientific arrangement and from the thoroughness with which the theory has been worked out. The treatise is divided into eight chapters, which coincide with the principal divisions of the subject.

In chapter i. are discussed the general principles of the theory—such as the differences between moving and resisting forces, the nature and laws of the force of friction, the differences between statical and dynamical friction. The conception of the cone of resistance, which seems to be due to the late Canon Moseley, and of which considerable use is made throughout the treatise, is clearly stated, and directly deduced from the fundamental law of the proportionality of the friction to the pressure.

Chapters ii. and iii. are devoted to the analysis of the equilibrium of particles and bodies on rough surfaces. In these chapters the great importance of the cone of resistance is fully appreciated, and the light which its employment throws on the causes of the indeterminateness of problems involving friction, as well as on the limiting positions of equilibrium, is most perfect. In the several sections of these chapters numerous examples are worked out which cannot fail to be of great assistance in enabling the student to obtain complete mastery of the general propositions.

Chapters iv. and v. contain the analysis of the motion of particles and bodies on rough surfaces. Here the reader will immediately perceive the effect on the problem of one of the principal distinctions between statical and dynamical friction, viz. that whereas statical friction at any point of a body in contact with a rough surface is equal and opposite to the resultant of all the other forces acting on the body at that point, the dynamical is along the direction of motion of the point, but opposed to the motion, and its magnitude attains the maximum value—that of the pressure multiplied by the dynamical coefficient of friction.

Section 2 of chapter v. relates to the initial motion of a solid body resting on one or more surfaces; and in example 1 we come across the seeming paradox of the possibility of a motion of pure rolling of a cylinder placed with its axis horizontal on a rough vertical plane. For the explanation of this apparent paradox, the reader is referred to the book itself.

Chapter vi. relates to the distinction between possible and necessary equilibrium; and it is shown, by the consideration of the differences between statical and dynamical friction (one of which has just been mentioned, and the other is that the coefficient of the former is greater than that of the latter),

that there are certain positions of a system in which equilibrium *may* exist, and others in which it must exist. The formula which gives these positions is—

$$\sum m (X\delta x + Y\delta y + Z\delta z) = \text{or} < 0,$$

where  $X, Y, Z$  represent the components of all the forces, external, geometrical, and frictional; the other letters and symbols have the ordinary signification. Now  $X, Y, Z$  may have such values for the position of rest as to satisfy this condition, whilst the friction is statical; whereas they may cease to satisfy it when the friction has become dynamical by a small motion given to the system. In this case the equilibrium is *possible*, but not *necessary*. If, however,  $X, Y, Z$  be such that this condition holds when the friction is dynamical, the position is one of *necessary* equilibrium; inasmuch as any small motion will cause the friction to take its dynamical value, for which the condition holds, and the motion will consequently be immediately destroyed. This chapter is certainly one of the most important, and at the same time the most interesting, in the book, from the clearness with which the differences between statical and dynamical friction are pointed out, and from the able manner in which the effects of these differences are developed.

Chapter vii. treats of the actual value of the acting force of friction, and of the cause of the indeterminateness of the mathematical solution, which lies in the abstraction introduced into the investigation. This abstraction Mr. Jellett considers to be the supposition of the perfect rigidity of the bodies and surfaces. The want of rigidity calls into action forces of elasticity, which produce slight oscillations, a discussion of which will lead to a completely determinate solution. This is illustrated by an example of a heavy body placed on a rough plane inclined to the horizon at an angle ( $\alpha$ ) greater than the angle of friction, and supported by a string. Only one equation can be obtained for the determination of the tension ( $T$ ) and the friction ( $F$ ), viz.  $T + F = Mg \sin \alpha$ . On taking into consideration, however, the slight extensibility of the string, and the small oscillations which the body will describe when its weight stretches the string, an equation is obtained for determining the tension, and, therefore, the friction can be fully determined.

In chapter viii. are discussed the interesting problems of the Top, Friction-wheels, and Locomotives.

The book is a really valuable addition to the literature of Rational Mechanics, and cannot fail to be of great service to the mathematical student. The general discussion of the force and its effects occupies a considerable space, and is so well developed as to be, to a great extent, available to those students who have not time or mathematical attainments sufficient to enable them to work through the whole of the mathematics. The book is most admirably printed, the diagrams are extremely well done, and the number of misprints observed were few and unimportant.

W. J. LEWIS.

### Notes of Scientific Work.

#### Geology.

**On the Quaternary Formation in the Neighbourhood of Dresden.**—In a paper bearing the above title, and recently published at Halle, Dr. C. A. Jentsch discusses—(1) the extent of the sea during that epoch; (2) the diluvial hills; (3) the Dresden heath; (4) the siliceous deposits of the valley of the Elbe near Dresden; and (5) of the loess. After critically treating the more important of the many theories respecting the nature and origin of loess, the author propounds his own views on the origin of that of the Elbe valley. At one period the Elbe flowed high above its present course, excavating its river-bed gradually, and at the same time underwent lateral dislocations, chiefly due to its smaller tributaries. The river then moved towards the right side, partly, the author thinks, on account of the tributaries, partly on account of the loose sands forming its banks. As the river worked its

way through the sand on its right side, the Elbe formed siliceous deposits on its left bank, which lay nearly horizontal in consequence of the river having deepened its bed only very slowly. High floods then occurred as they do at the present time. It is probable, however, considering the different climate of the quaternary epoch, and more especially the influence of larger masses of ice, that they exerted a greater disturbing effect than they do now. These floods, extending far inland, swept into the river large quantities of the land-snails which inhabited its banks then; and the mud, containing numerous land Mollusca, was then deposited on the left banks of the Elbe. (6) Local formations: the marl of Cotta near Dresden, and the freshwater limestone of Robschütz in the Tribisch valley, near Meissen. (7) The fauna of these beds: in the freshwater limestone were found skulls of man, and bones of other portions of the human body, as well as rude pottery, proving the contemporary existence of man with *Elephas primigenius* and *Rhinoceros tichorhinus*, the remains of which abound. In addition to these, remains of the following Mammalia were discovered in the same deposit:—*Plecotus auritus*, L., *Crocidura leucodon*, *Erinaceus europaeus*, *Mustela martes*, *Mus rattus*, *Sus scrofa*, *Equus caballus*, *Cervus elaphus*, *C. capreolus*; of Birds, *Ciconia alba*, Bechst.; and of Reptilia, *Tropidonatus natrix* and *Bufo cinereus*; and a numerous and rich fauna of freshwater shells.

**Tin Ore in Australia.**—According to Mr. F. T. Gregory's report presented to the Geographical Society of London at the meeting held on the 6th November, the district in Queensland in which tin ore has been discovered is situated near the headwaters of the Severn river and its tributaries, and comprises an area of about 550 square miles. The district is an elevated granitic table-land intersected by ranges of hills rising abruptly, some attaining an elevation of about 3000 feet above the sea. The richest deposits are found in the beds of the streams or in alluvial flats on their banks; the aggregate length of these bands is estimated at about 170 miles. Numerous small stanniferous lodes have been discovered, but only two of much importance, one near Ballandean Head station on the Severn, and another in a reef of red granite rising in the midst of metamorphic slates and sandstones. The lodes run in parallel lines bearing about N. 50° E. The ore, cassiterite, is invariably associated with red granite, the felspar being a pink or red orthoclase, and the mica generally black; when crystals of tin ore are found *in situ*, however, the mica is white. The crystals of tin ore are generally found in or along the margins of quartz, threads, or veins in bands of loosely aggregated granitoid rock, but they are sometimes imbedded in the micaceous portions.—At the same meeting, G. H. F. Ulrich gave some description of the recent discoveries of tin ore in New England, New South Wales, a district almost immediately adjoining the tin region of Queensland. It forms a hilly elevated plateau, nearly 4000 feet above the sea-level. The predominant rocks are granite and basalt, enclosing subordinate areas of metamorphic slates and sandstones; the basalt generally forms the highest crests, and is spread in extensive masses over the country. The granite of the tin district is similar to the Queensland granite, but carries white orthoclase, and is transversed by quartz veins containing cassiterite in fine druses, seams, and scattered crystals, and by dykes of a softer granite, consisting chiefly of mica, and with scarcely any quartz, in which cassiterite is distributed in crystals, nests, and bunches, as well as in irregular veins several inches in thickness.

**On the Included Rock Fragments of the Cambridge Upper Greensand.**—The occurrence of numerous subangular fragments in the Upper Greensand formation was so far remarkable that it had already attracted the notice of Mr. Bonney and Mr. Seeley, who had both briefly hinted at the agency of ice. Unaware of the suggestions of these gentlemen, Mr. W. Johnson Sollas and Mr. A. J. Jukes-Browne, in a paper read at the meeting of the Geological Society on the 6th November, have expressed themselves in favour of this view. The infallible indications of Upper Greensand origin consisted of incrustations of *Plicatula sigillum*, *Ostrea vesiculosa*, and coprolites, without which the boulders would be undistinguishable from those of the overlying drift. The following generalisations were propounded:—1. The stones are mostly subangular; some consist of friable sandstones and shales, which could not have borne even a brief journey over the ocean-bed. 2. Many are of large size, especially when compared with the fine silt in which they were imbedded; the stones and silt could not have been borne along by the same marine current. 3. The stones have various lithological characters, and may be referred to granitic, schistose, volcanic, and sedimentary rocks, probably of Silurian, Old Red Sandstone, and Carboniferous age. Such strata are not found *in situ* in the neighbourhood, and the blocks must have come from Scotland and Wales. Numerous arguments were adduced in favour of their Scotch origin. The above considerations, that numerous rock fragments, some of which are very friable, have been brought from various localities, and yet retain their angularity, were thought sufficient evidence of their transportation by ice; the majority showed no ice scratches, but the small proportion of scratched stones in the moraine matter borne away on an iceberg and the small percentage of ice-scratched boulders in many deposits of glacial drift show that the absence of these striae is

not inconsistent with the glacial origin of the included fragments. The fauna, so far as it proved anything, suggested a cold climate; though abundant, the species were dwarfed, in striking contrast to those of the Greensand of southern England and the succeeding chalk. The authors concluded that a tongue of land separated the Upper Greensand sea into two basins, the northern of which received icebergs from the Scandinavian chain; the climate of this basin was cold, that of the southern basin being much warmer.

**Notice on the Balaenoids of the Vienna Basin.**—Up to the present time only five species of three genera have been found in the Tertiary basin of Vienna, and they have been derived partly from the marine, partly from the Sarmatian stage. These are: *Cetotherium priscum*, Eichw.; *C. ambiguum*, Brandt; *Cetotheriopsis linziana*, Brandt; *Pachyacanthus Suessii*, Brandt; *P. trachyspondylus*, Brandt. The genera *Cetotheriopsis* and *Pachyacanthus* are new. A paper by T. F. Brandt on this subject is printed in the *Sitzungsberichte der Akademie der Wissenschaften, Vienna*, p. 3.

**The Tertiary Basin of the Lower Rhine.**—The large Tertiary basin of the Lower Rhine consists of a central basin with a number of smaller inlets, which are known under the names of the Dürener, Bonner, Düsseldorf, and Siegburger bays. The deposits are chiefly sand and clay, with numerous lignite beds, all which yield a very abundant flora and fauna. The fauna, in addition to land animals and such as only live in freshwater basins, present an extraordinary number of insects which could only have lived in the forests and on the moors of the lignite period. They furnish a clear proof that during the Middle Oligocene period an extensive land and freshwater formation existed on the Lower Rhine, that had but a very slight elevation above the sea-level, and most probably resembled the present Haff or the swamps of Florida. As regards the flora, 247 species are described in all, of which 120 have been met with elsewhere. (Dr. A. Gurlt, *Uebersicht über das Tertiärbecken des Niederrheins*, Bonn.)

**The Miocene of North Germany.**—A. von Koenen describes in the first part of his paper on the Miocene fauna of North Germany, published in the *Schriften der Gesellschaft zur Beförderung der gesammten Naturwissenschaften zu Marburg*, the siphonostomic Gastropods, in all 142 species of the following genera:—*Murex*, 7; *Trophon*, 1; *Tiphys*, 2; *Tritonium*, 5; *Turbinella*, 2; *Cancellaria*, 15; *Pyrula*, 1; *Spirilla*, 1; *Ficula*, 2; *Fusus*, 18; *Stenomphalus*, 1; *Buccinopsis*, 1; *Terebra*, 7; *Ebura*, 1; *Nassa*, 12; *Phos*, 1; *Purpura*, 1; *Cassia*, 5; *Cassidaria*, 1; *Columbella*, 4; *Oliva*, 1; *Ancillaria*, 2; *Conus*, 3; *Pleurotoma*, 26; *Defrancia*, 4; *Mangelia*, 8; *Borsonia*, 1; *Mitra*, 2; *Voluta*, 2; *Cypraea*, 3; *Erato*, 1; *Marginella*, 1.—The number of newly created species is 16.

**The Pliocene Formation of Tuscany.**—According to Antonio d'Archiardi, the Pliocene formation of Tuscany consists of bluish clay, covered by fine sands, over which again lie coarse boulders. He believes the boulders, as well as the sands and the clay, to have been simultaneously deposited from the same ocean, though precipitated to different depths. (*Bollet. geol.* 35.)

The last part of the *Jahrbuch für Mineralogie und Geologie* contains an interesting obituary notice of the well-known Alpine geologist, Arnold Escher von der Linth, who died recently at Zürich.

### Physiology.

**The Influence of the Length of a Nerve traversed by a Current of Electricity upon its Excitation.**—V. Willy, in a paper published in *Pflüger's Archiv*, states that it is generally allowed that the degree of excitation of a nerve, measured by the extent of contraction of the muscle to which it is distributed, augments with the length of the segment of the nerve through which the current is transmitted after this is closed or before it is opened. According to the author's latest researches, however, this only holds good for the descending current through the nerve, whilst the converse obtains for the ascending current. He arrived at this result by two ways: first, by ascertaining the strength of current, which, when passed through various lengths of the extrapolar portion of the nerve, induced a minimum contraction; and, secondly, by determining the amount of contraction produced by equal excitations passed through extrapolar segments of nerve of various lengths.

**The Metamorphosis of Tissue under the Influence of Morphia, Quinine, and Arsenic.**—H. v. Boeck has published in the *Zeitschrift für Biologie* (vol. vii. part iv.) the results of his investigations of the action of the above-mentioned substances on a dog. The animal chosen for the purpose weighed 54 lbs., and during the experiment was daily fed with 500 grammes of good meat, containing 17 grammes of nitrogen and 150 grammes of fat, and 150 c.c. of water. In the first experiment morphia was used, and it was found that, when the excretion of nitrogen had remained unaltered for five days, the addition to the food of 1·5 grains of morphia per diem during those days caused a reduction in the amount of nitrogen to the extent of more than 10 grains (0·7 gramme) in that period. The second experiment was

made with quinine, and to the above-mentioned quantity of food one gramme (15·44 grains) of quinine was added per diem during three days, when it was found by daily analysis of the excreta that as much as 11·6 grammes (179 grains) less of nitrogen were excreted in eight days. This represented a certain though slight quantity of food and tissue spared by the use of the drug. The third experiment was with arsenic, of which altogether 2·5 grains were given in doses divided over three days. The results of analysis of the excreta again showed that only an inconsiderable amount of food and tissue were spared by the addition of this substance to the food.

**On Endogenous Cell Formation.**—The question of the endogenous formation of cells, says Professor Bizzozero, in a paper contributed to *Stricker's Jahrbücher* (part ii.), cannot be regarded as finally decided. Buhl thought he had set the matter at rest by his discovery of nucleated cell-containing cells in the exsudate of croupous pneumonia, but Steudener and Volkmann have thrown a doubt upon Buhl's observations, by showing that some cells can be enveloped or invested by others by a kind of invagination process, and consequently that the presence of cells in the interior of others is not conclusive evidence that they were developed in that position. More recently Oser, from his examination of the fluid discharged in artificially produced purulent ophthalmia, has again given support to the doctrine of endogenous cell formation. Bizzozero has recently investigated the cells which accumulate in the anterior chamber of the eye under various morbid conditions, and which frequently contain cells in their interior. Many of the cells are large, irregularly rounded, and contain numerous fat cells in their substance, a nucleus, and several pus corpuscles. The latter, he considers, have been absorbed, and not produced in the position they occupy, for if that were their origin, they should be met with in all stages of development, which is not the case. Moreover, they should occur from the very commencement of the suppuration process, and this is not in accordance with observation, as they are only found when the pus has been for some days in the anterior chamber, and the cells have already lost their contractility. Then, again, blood-corpuscles are not unfrequently found in the large cells, as well as those of pus. Bizzozero has made a series of experiments on animals that support the following conclusions at which he had arrived from his observations on man: 1. That the pus corpuscles in the large cells have the aspect of old and degenerating elements. 2. That the cell-containing cells never appear in the early stages of the inflammation; and 3. That in suppurative inflammation of the anterior chamber of the eye large cell-elements are formed, which, owing to the contractility of their protoplasm, have the power of taking up the surrounding cells. He believes that these large elements proceed from an hypertrophy of the pus-cells, since intermediate forms can be seen, and, according to all observation, the epithelium of the membrane of Descemet does not participate in their formation. What becomes of the large cells after they have ingested all the white and red corpuscles and smaller pus-cells, he has not been able to ascertain.

**The Action of Strychnia on the Vaso-Motor System.**—In the second part of *Stricker's Medizinische Jahrbücher*, which has just appeared, S. Mayer, of Prague, gives the results of his investigations on the influence of strychnia on the vaso-motor system. He remarks that, though numerous researches have been devoted to the action of this poison, comparatively little is yet known respecting it, through the attention of observers having been exclusively given to its singular power of producing tetanic contraction of the vaso-motor system. Mayer's experiments were conducted on rabbits and dogs by means of an ordinary kymographion. The animals were injected with a solution of nitrate of strychnia in water (the solution containing 0·0008 of a grain in 1 c.c. of water), and being introduced into the jugular or crural vein. In one set of experiments the dogs were stupefied by opium, and artificial respiration was maintained through a canula introduced into the trachea. The manometer giving the tracings was connected with the carotid artery. A plate showing the tracings obtained in this and other cases accompanies the paper. About thirty seconds after the injection of 2 c.c. of the solution the arterial blood pressure was found to undergo an extraordinary increase with a simultaneous great increase in the frequency of the pulse. At the same time the voluntary muscular system became tetanised, the chest being maintained for a long period in a state of maximum inspiration. The great augmentation in the blood pressure was clearly due in part to the well-known mechanical action of the tetanised muscles on the current of venous blood, and partly to the obstacle which such contracted muscles present to the entrance of blood from the arterial side. Other accessory circumstances tending to the same result were the dilatation of the thorax and the accumulation of carbonic acid or the deficiency of oxygen in the blood, which last has been demonstrated to act as a stimulant upon the centres of innervation of the heart and blood-vessels. To eliminate some of these disturbing elements, some animals were subjected to the action of woorara before the injection of strychnia. By this means the effects of the muscular contraction were removed while the respiratory movements were not interfered with. Great elevation of the blood pressure was still observed however; the

number of the cardiac pulsations was not altered. Mayer concludes, then, that the increase in blood pressure following the injection of strychnia into the blood is essentially due to an extraordinarily intense excitation of the vaso-motor centres in the brain, and upon the resulting contraction induced in the small arteries. This view is supported by an examination of the intestines, which become exceedingly pale, as well as by the effects of section of the spiral cord, which severs the vaso-motor nerve, when all increase of blood pressure ceases.

**A Certain Sign of Death.**—Dr. Hugo Magnus, Assistant Physician to the Hospital at Breslau, suggests, as the best means of determining the presence of lingering traces of life, that a tight ligature be tied round one of the fingers. If life be not extinct, the part beyond the ligature soon becomes red, the depth of the colour increasing to dark red and violet. Just above the ligature the skin remains white. The explanation is sufficiently simple: the ligature prevents the return of venous blood from the part; but the arteries, being deeper seated and more protected, still continue to convey blood to the capillaries. The part of the finger beyond the ligature consequently becomes engorged. This test is of value because it can be applied without difficulty, and has the advantage of being the more available the sooner it is tried after actual death.

**The Process of Coagulation.**—The last part of *Pflüger's Archiv* (vol. vi. parts 8 and 9) is almost wholly taken up with a long paper by Alexander Schmidt, of Dorpat, on the coagulation of fibrin. He discusses successively the mode of obtaining and the characters of the fibrinoplastic substance or paraglobulin, and meets the objections raised by Brücke to its separate existence. It can be thrown down from its saturated alkaline solution by exact neutralisation with acetic acid, provided there is no other neutral alkaline salt present. It can also be precipitated by carbonic acid gas from the diluted serum of blood, chyle, lymph, and pus. It is insoluble in water, but highly soluble in neutral alkaline salts, and in very dilute acids and alkalies. The so-called fibrinogenous substance he obtains from the fluids of the serous cavities by diluting them with several times their volume of water, and precipitating with acetic acid. The presence of these two substances—the fibrinogenous and the fibrinoplastic substance—is a primary condition for coagulation, but in addition there must be, he maintains, a third substance, a ferment. This in the living body is not contained, either in the plasma or in the blood corpuscles, but first appears after the withdrawal of the blood from the body. It is not clear whether it is generated in the white corpuscles or in the plasma, but it is certain that it is not produced in the red corpuscles.

### Botany.

Dr. Pfeiffer has issued a volume of a *Nomenclator botanicus*, which will contain in alphabetical order all the collective names, from sections to classes inclusive, which have been employed in systematic botany from the time of Linnaeus up to 1858, the date to which Dr. Pfeiffer brought his already published *Synonymia botanica*. The present work will really form a skeleton encyclopædia of systematic botany. Each article will commence with the etymology of the name and the original authority for it, to be followed in chronological sequence by the different views that have been taken of its systematic position, including references to the works of all systematists by whom each particular view has been adopted. The articles will therefore be complete historical digests, the utility of which can only be estimated by those who have had occasion to prepare anything of the kind in connection with their own studies. The present work, when completed, will take its place beside such books as Steudel's *Nomenclator*, Pritzels *Index Iconum* and *Thesaurus*, Walpers' *Repertorium* and *Annales*, as another of those indispensable aids to study which the laborious students of Germany have given to the botanical world. An especially important feature of the new work is that it includes Cryptogamic as well as Phanerogamic plants. No general view of the genera of the former exists later than that given by Endlicher eighteen years before, and it is often troublesome in consequence to run down a name in this branch of botany. Dr. Pfeiffer reasonably remarks that it was necessary to place some limit to his labours, and if one which is now fourteen years distant seems needlessly remote, he meets the objection by saying that he did not anticipate that it would have required so long a period of time to accomplish his task. It can hardly be doubted that, when the scientific history of our own day comes under review, the value of labours like those of Dr. Pfeiffer, in their influence on the progress of knowledge, will be estimated hardly, if at all, lower than that of actual scientific discovery.

**Mimicry in Fungi.**—In the *Gardener's Chronicle* for November 16, Mr. Worthington Smith records some very curious instances of "mimetic resemblances" among Fungi. *Agaricus atratus* is a very common and *Cantharellus carbonarius* a very uncommon fungus; the latter is always found in company with the former; and they are so exactly alike externally that it is impossible to distinguish them without gathering them and examining the gills. *Agaricus fascicularis* is one of our commonest fungi; two rare species have lately been added to

our flora, *Agaricus alnicola* and *Agaricus conissans*; they invariably grow with the former, and exactly mimic it in both habit and colour, although belonging to quite different subgenera with different-coloured gills and spores. *Agaricus carbonarius* and *Agaricus spumosos* have been found growing together, and so similar that it is impossible for the sharpest eye to distinguish one from the other without examination. One of our very commonest fungi is *Agaricus epipterygius*; quite lately, in the midst of a bundle of this species, Mr. Smith found single specimens of *Hygrophorus meiseriensis*, a species new to this country, and so exactly resembling its commoner brother in slender stem, moist pileus, and peculiar colouring, as to be certain to escape detection unless minutely and carefully examined. These four instances of rare species of fungus possessing the exact habits and colours of very common species might easily be multiplied in number. The only benefit or "protection" which Mr. Smith can suggest to have accrued from this "mimicry" is that in consequence of it the rarer species have hitherto escaped detection and extermination by fungus-collectors!

**Development of the Flower of the Hazel.**—At the recent meeting at Bordeaux of the French Association for the Advancement of Science, M. Baillon, president of the Linnaean Society of France, read a paper containing some very curious observations on the development of the flower of the common hazel (*Corylus avellana*). At the time when the female flowers are generally considered to be expanded (in the neighbourhood of Paris, as of London, towards the end of January), they consist of nothing but a pair of long styles, crimson and stigmatic at their extremity, united at their base to a small extent in a mass which contains neither ovarian cavity nor ovules. These female flowers are to be first detected about the month of May or June, their development proceeding gradually until it reaches the stage described above about the following January. It is only after this period, which is considered that of flowering, that the depression which exists in the interior of the styles becomes developed into a pit more or less deep, representing a single ovarian cell. Still later, about the month of April, two placenta appear on the walls of this cavity, and in the interval of the branching styles, under the form of vertical slightly prominent bands. Soon the lower portion of these bands, larger and thicker, is divided by a vertical furrow into two lobes, each representing an ovule. The ovary of the hazel is at this time unilocular and quadriovular; but soon, at the same time that the two placenta become more prominent, the development of one or two, rarely three, ovules becomes arrested. The ovules, when they arrive at their full development, have become descending, with the micropyle directed upwards and outwards. By what means they are fertilised by the pollen from the male catkins, which fall in January or February, remains a mystery.

The *Nachrichten* of the Göttingen *Gesellschaft der Wissenschaften*, No. 24, contain a paper by Dr. A. Stern on a hitherto unnoticed letter of Spinoza, and the correspondence of Spinoza and Oldenburg in 1665. In v. Vloten's supplement there is a newly discovered letter of Oldenburg, the answer to which is missing. Dr. Stern thinks he has found a fragment of the latter in Robert Boyle's *Works*, vol. v. p. 339 (Lond. 1744, fol.).

### FATHER SECCHI ON SOLAR DISCOVERIES.

TO THE EDITOR OF THE ACADEMY.

October 29, 1872.

SIR,—I regret that absence from London has prevented my replying to Father Secchi's letter earlier.

You will be able to inform him that you did not ask me to review the German edition of his book; and I hope that he will measure the regret which I felt in making the strictures I felt myself in duty bound to make by the unwillingness I showed—of which you can assure him—in undertaking the review. Having said this, I may add that I have just risen from a hasty glance at the German edition of which mention has been made, and I am rejoiced to acknowledge that in my opinion it breathes quite a different spirit from the earlier French one; so much so that, if we are not dealing with the work of the German editor, I am certain many scientific men in many lands will hail it as an indication that Father Secchi will probably do them justice in future; that he has not done justice in the past is an opinion I share with every man of science with whom I have spoken on the subject, including many of his own countrymen.

This being so, I do not feel it necessary to enter so freely into a discussion of the points raised as I otherwise should have done. I must however say a few words.

1. With reference to the work of the Kew observers in connection with planetary action, the memoirs referred to by Father Secchi were preceded by one dating as far back as 1863, communicated by Dr. Balfour Stewart to the British Association in that year.

2. Father Secchi does not deny the work of Henry and Rutherford (the difference between A's and B's types of stars is not in question); and if that work existed, I hold—and this is all I said—it should have been referred to when subsequent similar work was considered at length.

3. If the two propositions concerning the cause of the formation of solar spots do not exclude one another, why does Father Secchi say that one idea is more probable than the other?

4. With regard to the gases in the interior of the sun, the question of their transparency is not raised, nor shall I raise it now. What I said was, in other words, that Father Secchi seemed to base his proof of what would amount to an *absorption* in a *radiating* gas on the *absorption* of an *absorbing* gas such as the earth's cool atmosphere (p. 106).

### History.

**The Tradition of the Syriac Church of Antioch concerning the Primacy and the Prerogatives of St. Peter, and of his Successors, the Roman Pontiffs.** By the Most Rev. Cyril Behnam Benni, Syriac Archbishop of Mossul. Translated under the Direction of the Author by the Rev. Joseph Gagliardi. Burns, Oates, and Co.

ARCHBISHOP BENNI, a Syrian prelate, who took part in the Vatican Council, has published a collection of extracts from Eastern (chiefly Syriac) documents in behalf of papal authority. His readers are expected to look upon these extracts as exhibiting the primitive tradition of the East, as shown "by a diligent enquiry into the teaching of *its great writers*, who faithfully handed on to their successors those inviolable truths which they had received from their forefathers, in whose ears was still ringing the voice of the Apostles," &c.

If the book were intended for the learned, Archbishop Benni's preface might easily awaken the suspicion of being ironically written, for it is impossible, in fact, to display the nakedness of the land to intelligent eyes more completely than is done by this collection of extracts. But the majority of its readers must necessarily be incompetent critics of the evidence put before them, and if we may judge of them by the list of subscribers, they will have but little hesitation in concluding that the Eastern Church has always taught the dogmas lately defined in the Vatican Council.

The book consists of 228 extracts, of which the first 103

(constituting the most considerable portion of the work, and philologically the most interesting) have reference to St. Peter. The second part (extracts 104-127) is on "the Roman Church," and the third (extracts 128-228) on "the Roman Pontiffs, the successors of St. Peter." The last document of the first part is in Latin, and was printed in Rome. The other documents of this part are in general rhetorical or poetical extracts in honour of St. Peter, but contain nothing whatever favouring doctrine peculiar to Rome. And the compiler would have no difficulty in drawing up similar collections of texts in honour of St. Paul, St. James, or St. John.

The rest of the work is more important for the compiler's purpose. But even here a very large number of the texts quoted are quite irrelevant. Whole chapters, such as that on excommunication, are simply superfluous. No one ever denied that the bishops of Rome, like all other bishops, might lawfully refuse their communion to individuals or churches. The important thing to be proved is that individuals or churches out of communion with Rome are out of the pale of the Catholic Church. Many texts have no reference, direct or indirect, to Rome, but it is modestly assumed that whatever authority the Easterns attribute to their patriarch is a reminiscence of "the authority which by Divine Right was conferred to the Roman Pontiffs." The liturgical evidence is exceedingly meagre. The extracts from the "Syrian Liturgy" do not extend further than extract 108; those from the "Syro Chaldaean" stop at 112; three extracts from the "Syro-Maronite" (119, 123, and 124) are certainly not ancient. Of the extracts from the "Syriac fathers" (or rather fathers whose writings are preserved in Syriac) all but three belong to part i. Of the remaining three, one is the corrupt form of a well-known passage of St. Ignatius, who is erroneously imagined (p. 84 note) to have written in Syriac; another (109), attributed to St. James of Sarug, is acknowledged to be apocryphal; and a third (154), attributed to St. Athanasius, is a notorious forgery. The documents attributed to the Council of Nice are also well-known forgeries. The reference (174), stating that to the Roman bishop "the pontifical power over the whole world has been given as it has been defined in a canon of the Constantinopolitan Council," is a ludicrous misrepresentation of a canon which the popes have always execrated. The references to Sardica, Ephesus, and Chalcedon, are familiar to us from Latin and Greek sources, and (in Syriac at least) add nothing to the information we already possess. I must, however, warn English readers against the translation of extract 176, quoted from the Council of Ephesus to show that popes "are above Councils." The Council is made to say that it came to its decisions "*unavoidably compelled* by the canons, and by the letters of our most holy Father, and co-minister, Celestine, Bishop of the Roman Church." The Greek original has been the verb *ἀναγκάζειν*, which, as every decent scholar knows, does not imply the least kind of authority or superiority. Anyone, however inferior his position, who proves his point constrains (*ἀναγκάζει*) the person he convinces. Now the word *ج* in the Syriac version exactly corresponds to the Greek. It need mean nothing more than "rationibus movere." An excellent example of this use of the word will be found in Ebedjesu's *Nomocanon*, tract. vii. c. 6, where a patriarch says he is *forced* to grant an exemption to a monastery; the only compulsion being that the reasons for so doing are satisfactory.

The chief strength of the book with reference to unlearned readers lies in those extracts which have not the least particle of claim to represent Eastern tradition. The

strong passages, without a single exception, represent not Eastern, but Roman, tradition.

Moses of Mardin, for instance, is quoted (211) as offering Pope Julius III. a profession of faith in his own name and in that of his patriarch. But the important passage following this extract is not quoted. Moses proceeds to say that hitherto he had made no profession, because his patriarch had charged him not to be overhasty, "*donec ipsam professionem probe assequutus essem*," that is, until he had well learnt his lesson in Rome. "And now I perceive," he adds, "that *your* profession" (he is speaking to the cardinals) "is like a light placed on a candlestick," &c., as in text 217, quoted in proof of "Their inerrancy." This is the profession made at Rome by a *convert*. And Assemani, from whom Archbishop Benni has borrowed his extracts, adds—"*Haec ille; cujus tamen fidem Ignatius ejusdem Patriarcha nequaquam ratam habuit, ut postmodum compertum est.*"

The earliest and most sincere Eastern converts to Rome were the Maronites. They were formerly Monothelites, and are said to have had a devotion to Pope Honorius. William of Tyre in his history (lib. 22, c. 8) calls Maro a *haeresiarch*, and, when speaking of the union with Rome, says—"Abjurato errore quo diu periculose nimis detenti fuerant, ad unitatem Ecclesiae Catholicae reversi sunt, fidem orthodoxam suscipientes, parati *Romanae ecclesiae traditiones* cum omni veneratione amplecti et observare." This is to be borne in mind when reading text 134, and the like. Nor is it to be forgotten even when reading Nestorian or Monophysite writers. Archbishop Benni repeatedly quotes Benattibus, a Nestorian canonist. But the writings of Benattibus have been extensively corrupted. And Assemani (*B. O. tom. iii. part i. p. 545*) expressly says that, just as the Jacobites had altered the text of Benattibus, "*ita Maronitae crediderim quaedam addidisse vel detraxisse, quae ad suam religionem confirmandum facerent.*"

What I have said of Moses of Mardin holds good with reference to Raban Ara (138) (who was a mere monk, not a Catholicus or Primas), to the Jacobite bishops who wrote to Innocent IV., and to certain Chaldaean prelates. In the middle of the sixteenth century, Sulāka, one of the claimants of the Nestorian patriarchate, came to Rome, abjured his Eastern doctrines, and, professing unconditional obedience to the pope, was consecrated under the name of John. The present views of Archbishop Manning might with equal justice be quoted as evidence of the traditional doctrine of the Church of England.

On one point connected with these Chaldaean prelates it is necessary to say a few words. Archbishop Benni has quoted Elias of Babylon (199) as saying—

"Even [the Metropolitan of] our See of Babylon was not elected by itself, as those of other heretics who have lawlessly multiplied Patriarchs in the world without the permission of the see of the great Church of Rome: but it was by the command of the Pope, and by an order of the Roman Church, that the see of Babylon was filled up. Thus much is to be found written in our Annals, and thus it is that we have before received [our] power up to this day."

Here is a positive historical statement which would be most important if it were true. But it is notoriously untrue. It is either a wilful falsehood or an incredibly ignorant blunder. Not once or twice, but over and over again, as Archbishop Benni cannot but be aware, has the honest and learned Joseph Assemani indignantly protested against this delusion, as an invention of the partisans of Sulāka under the stress of controversy with their own countrymen. The pope had created an Eastern patriarch. The Nestorians said, and with perfect truth, that such a thing had never been heard of. The adherents of Sulāka talk about their annals, but they had none in reality, except those which they possessed in common with their Nestorian opponents. And the only

way in which they can be defended from the charge of deliberate falsehood is to suppose that they mistook Antioch, as being in the Roman empire, for Rome.

By far the strongest extracts (and the most numerous) are taken from Joseph II., bishop of Amida, afterwards Chaldaean patriarch. He certainly was a very remarkable man. He has left an interesting autobiographical sketch. In his pursuit of knowledge under difficulties he even attended Mohammedan schools, and read so many bad books that he considers it a divine mercy that hell had not yet overtaken him. But in this unhealthy literature he unfortunately did not reckon the Pseudo-Isidorian decretals, which he quotes twice (126, 154) in the extracts selected from him by Archbishop Benni. Are these decretals part of the primitive tradition of Antioch? Is not the mere fact of believing in them a proof that we have here to do with the corrupt traditions of the West?

The language of adulation, when addressed to a pope, is naturally expressive of orthodox ultramontane doctrine. "When you speak," says the author of a certain dedication, "men crowd to listen with that awful reverence as to holy oracles or divine prophecies." The person so addressed was Nell Gwynne, but it would not be difficult to quote similar language addressed by one Eastern ecclesiastic to another. And if it were addressed to the bishop of Rome, the author would naturally speak of St. Peter in the style common to Christians of all Eastern and Western churches, and all this, "with continual adorations, perpetual bowings, and sempiternal kneelings before the holy feet" (I am quoting Elias of Babylon), would produce exactly the kind of evidence suited for Archbishop Benni's book. Now this kind of testimony is what no Eastern ecclesiastic who wanted the pope's help would hesitate about for a moment. In his mouth it would mean no more than "I am, Sir, your most obedient servant." It is the bait which Orientals have repeatedly tried, and sometimes with success, to impose upon Rome, even when they were doggedly resolved to make no real concession. Archbishop Benni is aware of these attempts, for he avoids quoting certain testimonies which would have suited him admirably, had not the exposure of the fraud been close at hand. But he has not always been successful in avoiding cases of this kind. Assemani and Lequien consider the testimonies of 1247 as fraudulent as those of 1223; and Archbishop Benni is silent about the latter because Raynaldus has shown their insincerity, but he produces the former because Raynaldus was imposed upon by them as the Dominicans had been before him. But perhaps the most notorious fraud ever practised upon Rome was perpetrated in the name of Gabriel, who is introduced to us as "the 97th successor of the Evangelist St. Mark," and is quoted oftener than St. Ephrem—I need hardly say, in support of doctrines for which St. Ephrem might be searched in vain.

What has this Gabriel to do with the tradition of the Syriac Church? He was an Egyptian Monophysite by whom (or in whose name) Rome was most shamelessly deceived. The whole embassy described by Baronius in the appendix to his sixth volume was an impudent imposture, as is admitted by Roman Catholic as well as by Protestant writers. The Carmelite Thomas a Jesu is not less strong in his expressions than the Protestant Geddes. Renaudot and the Bollandist Sollier allow that nothing came out of the whole business. And, quite recently, a letter written by a contemporary, and to some extent an eye-witness, the famous Cyril Lucaris, Melchite patriarch of Alexandria, has been published, in which he speaks of—

"*illam illusionem, potiusquam legationem, cum revera impostura fuerat cujusdam Coptae vel Eutychiani qui se Romam profectus Alexandrini*

patriarchae legatum falso professus fuerit. . . . At creato Paulo fraudeque detecta, ille bonus legatus Roma clam ejectus, ne forsan palam fieret comoedia, huc in Aegyptum se retulerat."

I have said that the chief strength of Archbishop Benni's book lies in those extracts which really represent Roman, and not Eastern, tradition. These are mixed up with others, and the unlearned reader is left under an impression that all the writers give more or less the same testimony, which is, indeed, very far from being the case. But if all the Roman witnesses were cut out, I should still refuse to accept Archbishop Benni's representation of the Eastern tradition, even as regards the patriarchal authority. In the first place, he has only given those extracts which describe one stage, and a very modern one, of the Nestorian patriarchate. He wishes to represent it as absolute, and therefore does not scruple to omit qualifying clauses of the utmost importance. He quotes, for instance (160), a synod forbidding metropolitans and bishops "to violate any order, command, or decision of the Patriarch," &c., but he leaves out the important addition, "when he commands according to the will of Christ." According to theories now in vogue, the will of Christ is inferred from the absolute nature of the authority which commands. But it was not always so, even in the Roman Church. I am, however, quite willing to grant that absolutist ideas were dominant (on paper at least) at the time that Ebedjesu wrote his *Nomocanon*. But these ideas were not primitive, any more than the tendencies in behalf of hereditary succession in the patriarchate. The *Nomocanon* itself bears witness to this. Under the head, "They are above Councils," we are treated to extracts from the Synod of Dadishû, which say that "Bishops cannot summon any Synod against their Head and leader," that he is to judge his inferiors, but that "his own judgment is to be reserved to Christ." But every reader of the *Bibliotheca Orientalis* knows that the supposed Synod of Dadishû is a forgery, and every reader of the *Nomocanon* of Ebedjesu knows that provision is made in the canons for the synodical judgment and deposition of the patriarch for heresy or other misconduct (see tract. viii. c. 20, can. 4 and 5, also c. 21). More than one patriarch has, in fact, been synodically deposed. Even the forged letter of the "Occidentals" given in the ninth part of the *Nomocanon* reserves the judgment of the patriarch to the other patriarchs, or to the sovereign. It is easy to understand why Archbishop Benni passes over all this in silence.

If we exclude the irrelevant evidence, and that which is manifestly purely Roman, there still remains that of the spurious Arabic canons attributed to the Council of Nice. The importance of these has been much exaggerated in consequence of their being accepted by the different Eastern communions. From the hostile feeling which keeps these communions apart, it has been argued that none of them would borrow from another, and that what is common to them all must be anterior to the schism. But *à priori* arguments like this require to be very rigorously verified. It was on exactly similar grounds that the Samaritan recension of the Pentateuch was formerly supposed (but most erroneously, as every scholar is now aware) to be of the utmost antiquity and purity. These Arabic canons contain gross anachronisms which prove them to be of much more recent date than the beginning of the schism. The hostile feeling referred to has not, in fact, been of a nature to prevent borrowings, especially of forgeries bearing names which did not awaken sectarian animosity. Nor has it been as persistent as is commonly thought. The Moslem invasion was productive of pacific and even kindly intercourse, sometimes closely approaching to religious intercommunion, between the separated churches, and great writers like Elias

of Damascus on the Nestorian and Barhebraeus on the Jacobite side wrote treatises to prove that the great Eastern communities were equally orthodox in fact, that their differences were verbal, and that party spirit alone kept them asunder. There are repeated instances on record (see Lacroze, *Histoire du Christianisme des Indes*, tom. ii. p. 115) of Nestorians applying to Jacobites for bishops; the identity of *rite* being considered by them as of greater importance than the difference of dogmatic formula. And as for borrowing of literary forgeries, there is the well-known case of the Jacobites adopting the Nestorian fable of the transfer of the patriarchal dignity to the see of Seleucia. There is nothing in the Arabic canons on the dignity of the Roman see to shock either Nestorians or Jacobites, because they all consider that see as having disappeared from the Church many centuries ago. The canons therefore merely represent to them fragments of ecclesiastical discipline which have long since become obsolete. We have at present no means of determining the date of this forgery. The manuscripts which contain the canons are not of very great antiquity. The earliest writer who can be referred to as recognising their existence is Elias of Damascus; but no sensible person will accept such a reference as extract 156 as a proof that they existed at the time of this writer. A collection of canons admits of an indefinite amount of increase, for which the author whose name it bears is in no way responsible. A very large number of the MSS. of Dionysius Exiguus contain documents which he certainly had not included in his collection. We require, then, to see the collection of Elias of Damascus as a whole, and to know its literary history as we know that of Dionysius Exiguus, before we can be sure that he really knew of the spurious Arabic canons of Nice. As to the propagation of canons supposed to be favourable to Rome, there is no historical difficulty whatever. The catholicism of Rome was for a long time most powerful, nay dominant, in the East. Besides the Latin kingdom of Jerusalem, there were the principalities of Tripoli and Edessa, the latter extending beyond the Euphrates. The principality of Antioch lasted for more than a century and a half. There was the nation of the Maronites, and there was the Armenian kingdom under the house of Rupen. In Alexandria one of the Melchite patriarchs was in communion with Rome, and sent a deputy to the Lateran Council. It is not improbably to his influence that the "Filioque" has found its way into the canons attributed to St. Hippolytus. This, too, is the time of the daring fraud of the "ancient missionaries" denounced by the learned Dominican Lequien in his *Panoplia contra Graecos* (p. xiv), and of those "spurious and lying testimonies" forged in support of papal authority which imposed upon St. Thomas Aquinas and all Latin theologians for many centuries.

The Arabic canons themselves, however, furnish us with a clue which enables us to conjecture their origin with a great amount of probability. De Marca long ago called attention to the canon which placed the island of Cyprus under the jurisdiction of the patriarch of Antioch. *Is fecit cui prodest*. The Maronite patriarchs of Antioch exercised jurisdiction in Cyprus over several bishops and churches of their own communion, and it was most probably in their interest that the canon was forged in justification of an ecclesiastical arrangement directly at variance with ancient rule. If the fraud owes its origin to a Maronite hand, it is not to be wondered at if in some of the canons great authority is ascribed to the Bishop of Rome.

Fraud and forgery are not pleasant words, but they are unfortunately unavoidable in a discussion of the pontifical claims which Archbishop Benni has at heart. And if the whole truth must be spoken, his own book is itself no better

than a pious fraud ; in saying which I do not wish to imply that the Archbishop is not the dupe of his own legerdemain. Far less would I wish to make any imputation on the excellent Italian priest by whom the book has been made accessible to English readers, and whose perfect sincerity in the pursuit of truth and knowledge is beyond all suspicion.

P. LE PAGE RENOUF.

**The Patriarch and the Tsar.** The Replies of Nikon. By William Palmer. Trübner and Co., 1871.

THE general impression this book leaves upon us is that there is a good deal of fine confused cursing up and down it. Nikon overwhelms his adversaries with torrents of invective from the Bible and the Fathers and the Councils against the sins which he chooses to impute to them (and his instinct is generally sound), and now and then clenches the matter with a vigorous bit of denunciation of his own. To appreciate the full oddity and the full impressiveness of the book it ought to be read through ; perhaps the best single passage to which to refer the reader is the peroration which contains an elaborate series of instances of boldness and audacity, drawn up because Nikon had been accused of audacity and wished to retort the charge. The following is a curious specimen of "boldness," "With boldness the children of Israel 'groaned by reason of their bondage.'" Of course Nikon was a barbarian, and his sense of the ridiculous had received at the best a very one-sided development : he accumulates forty pages of quotations from the Old Testament in the New, to prove that uninspired writers ought never to dispense with an appeal to authority. Feeling himself that this was, if possible, a superabundance of testimony, he puts a cross at the beginning and at the end, that weak brethren may skip ; but in general the torrent of quotation flows unchecked. Prince Nikita Orloffsky was employed to draw up a sort of handybook of Russian law, rather too much in the interest of the Tsar. Among other things this code enacted that the church property in the suburbs of Moscow and other cities should revert to the State. Nikon will not allow that the church has or can have property, and writes out several chapters of the Pentateuch about the Levites and the suburbs assigned to them, because they had no heritage, and then breaks out into something like eloquence :—

"Consider, thou fighter against God, Prince Nikita, how thou speakest of those suburbs as belonging to the patriarch, and to metropolitans, and bishops, and monasteries. Do they not all belong to God ? And we belong to Him, all, except thou and such as thou. Ye are not His."

Again, Nikita had enacted penalties against those who perjure themselves after kissing the cross—a form of oath consecrated, one might have thought, by the example of St. Vladimir, who commended it in his historical testament to the respect of his sons. But Nikon could not remember any Greek precedent to authorise the national oath, so he writes out two or three curious pages of St. Chrysostom against swearing in the abstract, to prove that unauthorised oaths are a mortal sin, which he reviles Nikita in a running fire of parentheses for committing. These instances are sufficient to show that Nikon's replies are quaint enough to compensate for their prolixity, and there is one very picturesque account of a scene with the imperial commissioners in which he had an opportunity, which he used to the full, of imitating St. Basil defying his persecutors. To most Western readers it will be new to find the Canons of Carthage and Sardica, including the one on appeals to Rome, part of the recognised common law of the Russian Church in the seventeenth century, while the official history of the apostasy of the Pope, which is dated from Formosus, and his con-

sequent deposition from his primacy among the patriarchs almost makes the efficacious businesslike romance of the Pseudo-Isidore respectable.

Students to whom these considerations are familiar will be apt to complain that an isolated translation of a pamphlet, which even without the appendix attains the dimensions of a history, is hardly the most useful supplement to such an history as Mouravieff's, especially as the questions of the Boyar Simeon Streshneff, and the answers of the Metropolitan, Paisius Ligarides of Gaza, are only given in an analysis, which is not full enough to enable us to judge of this plausibility. We have only the skeleton of the secularist indictment, while the hierarchical defence is given *in extenso*.

For the replies of Nikon are quite sufficient to prove that the real question at issue was whether the Patriarch or the Tsar was to be supreme in Russia, and that we cannot resolve it away into an ordinary quarrel between barbarous nobles and an overbearing favourite. Nikon's own *ex-parte* statement gives the impression that in the actual dispute he was substantially in the right (though it is strange that he should have imagined he was honouring the sacraments by refusing them to criminals under sentence of death), but that his difficulties were in great measure of his own creation, and that he did not choose his ground for resistance well.

Nikon's aim was to restore in Russia the purity of the Byzantine Church, just as it was the aim of the Tractarians to restore in England the purity of the Church of the Fathers. Like them he hated liberalism and modernism as much as slovenliness, though he had more to do with the latter, and only knew the former in the shape of importations of Polish pictures and quotations from Aesop's fables. He had all their energy, all their singlemindedness, all their obstinacy, all their scrupulosity. He could not have their culture—which would not have saved him, as it did not save them, from attributing an unreal homogeneousness to the past, and trying to build upon a mirage.

When first chosen to the patriarchate, he exacted a pledge of spiritual obedience from the Tsar and the nobility. When the Tsar absented himself from public worship, he protested solemnly in the presence of the people that he could no longer act as patriarch. He seems to have been influenced partly by the duty, as he regarded it, of fleeing from persecution, partly by a sense that, as the Tsar by encroachments on church property and by subjecting ecclesiastical persons to his own courts had broken one side of the compact, he could no longer be held to the other. He really "struck," and it was not for two years that his opponents formed the design of treating this strike as a resignation vacating the chair. Meanwhile Nikon had had time to recollect himself and to reconnoitre the strong points of his position. The Tsar had recognised him as patriarch after his protest, and there was no ecclesiastical authority in Russia competent to deal with a patriarch. It was worse than useless to hope to cope with him by importing a Pangloss *in partibus* like Paisius, who had committed two plain and almost unpardonable offences against ecclesiastical law by living in Latin communion and accepting Latin orders, and again by interfering in Russia beyond his nominal diocese at all.

The incurable weakness of Nikon's position was that the Tsar was the real centre of everything in Russia. One Tsar had fetched some patriarchs from Constantinople to make him a patriarch of his own ; another could always fetch some more when he was tired of the particular plaything called Nikon. The *prestige* of the Tsar more than half subjugated Nikon himself ; his bitterness against his other opponents goes to the full measure of what a prelate in the seventeenth century permitted himself ; his bitterness against the Tsar

never carries him beyond the measure of what a prelate or at least a religious newspaper might think permissible in the nineteenth.

G. A. SIMCOX.

**First Part of the Royal Commentaries of the Yncas by the Ynca Garcilasso de la Vega.** Translated and edited, with Notes and an Introduction, by Clements R. Markham. London: printed for the Hakluyt Society. Vol. I., 1869; Vol. II., 1871.

MR. MARKHAM'S translation was so much the more necessary as Garcilasso's great work was to this day almost untranslated. Sir Paul Rycaut's elucubration, published in London in 1688, and dedicated to James II., is only an abridgment, omitting no less than fourteen out of the twenty-six chapters in the first book and seventeen out of the twenty-eight in the second. Besides, the worthy knight (for such was Rycaut's title), who happened to be but very slightly acquainted with the Spanish tongue, had a trick of wildly guessing at the sense, which process was very ingenious indeed, but not so accurate as it might have been. Of the innumerable blunders with which he interspersed his version of the *Royal Commentaries*, Mr. Markham cites one which is characteristic. Speaking of "five Indians in Cuzco who played the flute very well from any music-book for the organ that was placed before them," Garcilasso adds, "*Eran de Juan Rodriguez de Villalobos vecino que fue de aquella ciudad*"—"They belonged to Juan Rodriguez de Villalobos, formerly a citizen of that town" (l. ii. ch. xxvi.). Rycaut renders it: "They belonged to one Juan Rodriguez, who lived at a village called Lobos, not far from this city."

In the short preface with which the first volume opens, Mr. Markham has summed up very exactly the little we know of Garcilasso's life. He was born at Cuzco in 1540 from Garcilasso de la Vega, "one of the few honourable cavaliers of noble blood among the conquerors of Peru, and Ñusta Isabel Chimpa Oclo, grand-daughter of Ynca Tupak-Yupanqui. He was brought up amidst the civil wars which raged for years in the newly conquered empire.

"Almost every week, he tells us, some of the relations of his Indian mother came to visit her; and on these occasions their usual conversation was on the subject of the former grandeur of the fallen dynasty, of its greatness, of the mode of government in peace and war, and of the laws ordained by the Yncas for the good of their subjects. The half-caste boy listened eagerly to these conversations; and at last, when he was about sixteen or seventeen years old, he began to put questions to an old Ynca nobleman, who was his mother's brother, and received from him the story of the origin of the Ynca dynasty."—"The young Ynca had a wonderful start of all contemporary travellers, for he was born, as it were, in the midst of his work, and began to store his material as soon as he could speak."

However, he did not use it so soon, for after his father's death in 1560 (not in 1550, as Mr. Markham, through a printer's mistake, seems to say), being just twenty years of age, he left America for ever, went to seek his fortune in Spain, became a captain in the army of Philip II., and never dreamt of composing his countryman's history until forty years later, at which time he must have forgotten a great part of what he had heard in his boyhood. So he wrote to all his surviving schoolfellows, "asking them each to help me by sending me an account of the particular conquests which the Yncas achieved in the provinces of their mothers," which they did accordingly. He then made careful extracts from such of the Spanish historians as had spoken of Peru, Cieza de Leon, Agustin de Zarate, Gomara, Acosta, and, above all, Blas Valera, whose papers, half destroyed by the English in 1596, are now entirely lost. At least the fourth part of the *Royal Commentaries* is copied almost word for word from those historians, so that I think there is a little exaggeration in Mr. Markham saying that without Garcilasso's work "our knowledge of the civilisation

of the Yncas, the most interesting and important feature in the history of the New World, would indeed be limited." If, by some mishap, the *Royal Commentaries* had been lost, we would find in Cieza de Leon and the others nearly all the material that a "rather garrulous" Ynca has drawn out in his long-winded narratives, especially possessing, as we do now, the works of some posterior writers, Herrera, for instance, or Montesinos, whose importance for the early periods of Peruvian history is almost unrivalled. I know Mr. Markham is not of the same mind, and sets but little value on the information of Montesinos, whom he looks upon as a second-hand authority. If I be allowed to express my opinion here, I think Montesinos is now treated by Peruvian scholars as Manetho was by the chronologists of the seventeenth and eighteenth centuries. Before the dawn of Egyptology, almost all the critics had adopted entirely the traditional data of Herodotus, Diodorus, and other classical writers of greater or less authority: they held the Manethonian lists of Egyptian kings to be mere fictions, and did not give them much more reality than that Mr. Markham seems inclined to give to Montesinos' lists of Peruvian sovereigns. We know how the case of Manetho v. Herodotus ended, and how it was proved that after all "that impostor of a Sebennyitian priest" was perfectly right. I am very ready to admit, not that all the traditions collected by Montesinos from the mouth of the *Amautus* are historical truth itself, but that they are a nearer approach to historical truth than some of the traditions inserted in Garcilasso's *Royal Commentaries*.

I need not say that Mr. Markham's translation is most accurate. Mr. Markham's accuracy as a translator has been well known since he published for the Hakluyt Society the *Narrative of Pascual de Andagoya, the Travels of Cieza de Leon in the Years 1532-1550, the Life and Acts of Don Alonso de Guzman, 1518-1543*, and other equally interesting works from the time of the Conquest. The notes, philological as well as historical, derive a great interest from the fact of Mr. Markham having personally explored Peru and learned the Quichua tongue. The two maps in the second volume, exhibiting one the plan of Cuzco, ancient and modern, the other the Sacsahuaman or great Ynca fortress of Cuzco, are very serviceable to make the reader understand the chapters which contain the description of the imperial city of Cuzco (book vii. ch. viii.-xiii.) and of its fortress (book vii. ch. xxvii.-xxix.).

## Philology.

**An-Nadīm's Index of Arabic Literature.** [*Kitāb al-Fihrist*, mit Anmerkungen herausgeg. von Gust. Flügel. Nach dessen Tode besorgt von Joh. Rödiger und Aug. Müller. Zwei Bände. Mit Unterstützung der Deutschen Morgenl. Gesellschaft. Zweiter Band, die Anmerkungen und Indices enthaltend. Von Aug. Müller.] Leipzig: Vogel.

NOT much later than it was promised appears the second volume of this very important work (see *Academy*, vol. iii. pp. 17-19), by which the text already published is for the first time made fully available for study. One is almost sorry that the publication of the first part was not delayed till the second could appear with it, for no doubt many an one will have been too impatient to put off the study of the text, much as he may have wished for the notes, while to read the commentary afterwards by itself is of but little use, even if it be possible.

The commentary is Flügel's own work. The editor, Dr. Müller (a *Privatdocent* at the university of Halle) has been at the pains to subject the almost completed but not finally revised manuscript to a careful but considerate redaction. He has made few additions of his own.

It is clear that Flügel worked at these notes for many a long year. Only a man of his untiring industry and wide reading, especially in the literary histories and bibliographical works of the Arabs, could accomplish such a task. He also benefited by the counsel of his old friend, Professor Fleischer, the undoubted chief of living Arabic scholars; I seem to detect this wholesome influence in other passages besides those in which it is mentioned.

The importance of the commentary consists not so much in the explanation of the subject-matter as in the literary notices. And rightly so, not only because the work of An-Nadīm himself is predominantly bibliographical, but also because a complete explanatory comment, even if such could be produced by a single scholar, would have assumed far too large dimensions. The literary notices are all the more copious, sometimes rather too much so, as when he quotes the secondary and the original authorities side by side, e.g. the *Marāʿid* together with *Yāqūt*. With regard to the Arab scholars mentioned in the *Fihrist*, the material supplied by printed texts is quoted almost *in extenso*, and much from manuscripts besides. But the notes also contain much that illustrates the text in other ways, e.g. the translation of many difficult passages, especially the poetical ones—a great boon to the reader. Here and there, too, the subject-matter is for good reasons explained at greater length. We are thus presented with many valuable additions and corrections to the earlier work of Flügel on the section relative to Mani. His notes on the equally important but extremely obscure section on the heathen of Harrān are naturally less copious, because here he was limited to conjectures. The present writer has been also much occupied with these chapters, especially the darkest of all, that on the mysteries, and thinks he is in a position to solve some of the difficulties, especially by a retranslation of the strange-looking sayings into Syriac. But we are not here upon solid ground; at any rate matters of this kind are better treated in a monograph.

The commentary also contains much that relates to the criticism of the text. I notice especially that the deficiency complained of in my review of the first volume—the omission of the variants to the section on Mani—has been completely remedied, the variants being supplied by the editor according to a new collation.

It is but natural that a work of such innumerable details should not be without mistakes and hiatuses. Every

Orientalist who is in any degree at home in one of the many departments touched upon in the *Fihrist* will be able here and there to offer corrections and additions, without any disparagement to the uncommon merits of the author. Flügel himself often modestly admits that he was unable to explain this and that point, particularly where the subject is one which only concerns the Arabist indirectly. I mention this in order to prevent the few small additions and corrections which a varied reading has suggested to me in several passages from being interpreted in the light of a disparagement to the author.

To the careful discussion of the word *ḥibr* (Anm. 6, p. 9) I may be allowed to add that it seems to be used of the common black ink in two late and incorrect Syriac receipts for the preparation of that fluid (Wright's *Catalogue of Syriac MSS.* pp. 580b and 581a).—Page 23, line 23, the corrupt and misread word *mohṭawī* conceals the Syriac *bēth maw-tēbhē*—the name given by the Nestorians to those books of the Old Testament which belong neither to the Pentateuch nor strictly to the Prophets. The fact that this catalogue of the books of the Bible is really of Nestorian origin was mentioned in my review of the first part. This accounts further for the mode of writing "Ruth" with an *Ain*, which struck Flügel as peculiar; in line 7, where a Jewish authority is used, the word is naturally given according to the Hebrew orthography without that letter.—In the discussion of the original conclusion of the great historical work of Tabarī and its appendices (Anm. 5 to p. 234), special reference should have been made to Ibn-al-Athīr, viii. 68, of which more than half the first part is entirely based on Tabarī.—The identity of the Mandaean and the *Moghtasila* (Anm. 10 to p. 340), which I formerly accepted myself, is no longer tenable. The Elkesaites or *Moghtasila* have had great influence on the ceremonies and in part also the dogmas of the Mandaean, but in other respects the two are very different. The celebrated verse in p. 142, 16, is not erotic, but refers to the relation of Nābigha to his princely patron, with whom he had fallen into discredit (cf. Ahlwardt's edition, No. 17, v. 28).—It must be due to a momentary forgetfulness that Flügel speaks of the poet 'Omar b. abī-Rabī'a as if an entirely unknown person (Anm. 17, p. 306).

The indices by Dr. Müller are comprehensive. They are obviously of particular value in a work of this kind, which within a comparatively small compass (I had supposed the *Fihrist* to be a much larger work from what I knew of the contents) contains such a vast amount.

As long as Orientalists continue to be instructed by the work of the excellent bookseller An-Nadīm, so long will the name of Flügel survive as that of its first editor and expositor, who by discretion and persevering industry has accomplished more than many a scholar his superior in genius and width of view. In conclusion, hearty thanks to both the young scholars, by whose exertions this posthumous work has become accessible to us. TH. NÖLDEKE.

**The Semites in their Relation to the Hamites and Japhethites.**  
[*Die Semiten in ihrem Verhältniss zu Channiten und Japhethiten.*]  
By J. G. Müller. Gotha: Besser.

THE table of generations in the 10th chapter of Genesis contains the ethnological theories of the Hebrews about the nations with whom they were acquainted at the time of the first kings. These all belong to Blumenbach's Caucasian race, and group themselves into three families of nations, with the three sons of Noah, Ham, Shem, and Japheth, for progenitors. It is probable that the popular Hebrew opinion of that time reckoned amongst the sons of Ham all the peoples that were akin, in language and civilisation, to

the Egyptians; amongst the children of Shem, all those that were similarly related to the Hebrews, who are designated as descendants of Shem; amongst the sons of Japheth, all the tribes standing in a kindred relation to the Medes and Greeks—a view which nearly every one who has studied the passage in question has read it as conveying.

The author of the book before us judges quite otherwise of this tenth chapter, inasmuch as he takes it to contain a scientific truth, rather than a popular belief. At least this is the only intelligible explanation of the way in which he dwells on its supposed inconsistencies, and undertakes to bring them into harmony with acknowledged scientific certainties. After the author has determined on etymological and antiquarian grounds that the five sons of Shem, Elam, Asshur, Arphaxad, Lud, and Aram, are Indo-Germans, he observes that the same must hold good for Eber, Joktan, and Jerah, the ancestors of the Hebrews, the Arabians, and the Chaldaeans, who were descendants of Arphaxad. But if this remark is applied to the whole nations, it would follow, as the author concludes, that the Hebrews, Arabians, and Chaldaeans were Indo-Germans, and spoke Indo-Germanic languages. But this view is opposed by their language, which we know, and which is, closely related to the language of Canaan; and Canaan is mentioned as a descendant of Ham. If these two facts are regarded as equally certain, nothing is left but to declare the Semites to be Hamitic Indo-Germans! According to Professor Müller there are properly speaking neither Semites nor Semitic languages, only Hamites and Indo-Germans. What we call Semites are only Indo-Germans who have adopted Hamitic languages, and what we are accustomed to call Semitic languages are at bottom only Hamitic dialects adopted by Indo-Germanic nations.

Though all these conclusions are correct from the logical point of view, there is much to be urged against them. In the first place, it is exceedingly hazardous to argue from the unknown to the known, *i.e.* from the nationality of the unknown Arphaxad to the nationality of the known Jews, Arabs, and Chaldaeans. In the second place, the proof on which the relationship of the so-called Semitic with the Hamitic languages depends is so far incorrect that it rests upon a complete misconception of the whole state of the question. None of the scholars who have pronounced the Semitic and Hamitic languages to be related suppose the relation to be as close as that between the Hebrews and Phoenicians, as the author, in support of his hypothesis, appears to assume.

The author seems altogether to have overlooked the contradictions into which one falls as soon as one begins to look upon the table of generations as a piece of ethnology, and is driven to accept the consequences that follow from it. For if we realise to ourselves the relation of this table to its author, we find only two possible alternatives: either the author started from a tradition still living amongst his countrymen, or he had made independent researches respecting language, customs, and other points of ethnological significance. On the first supposition it would be unreasonable to separate those Semites whom he looks upon as Indo-Germans from the other children of Japheth; while on the second hypothesis it would be impossible to defend him from the charge of shallowness, in placing Phoenicians and Egyptians in the same linguistic family.

We have therefore no choice but to follow the example of most unprejudiced Biblical scholars, and regard the genealogical table as a piece of popular ethnology of limited scientific value. It is consequently labour in vain to try to harmonize each point in it with the rest and with the results of modern science. It is self-evident from this that in

forming our opinion of the Semites as a nation we must restrict ourselves to such authentic data as language, literature, civilisation, &c., which determine the judgment of an ethnologist. We also see that the Semites, although linguistically related to the Hamites, yet are clearly distinguished from them and form a family by themselves. The Semitic languages are distant collaterals, not descendants, of the Hamitic, just as the Germanic languages are not daughters, but sisters, of Sanskrit. Indeed, Semites and Hamites stand much farther apart than the different groups of the Indo-Germanic family, for these agree in the formation of the cases as well as in their pronouns and roots, while Semitic and Hamitic languages only agree in their pronouns and a few roots, their conjugations and declensions being entirely different.

In conclusion we cannot refrain from observing that, although Professor J. G. Müller has collected a number of important facts respecting the history of Semitic civilisation, and has accompanied them by some excellent remarks, he has been led by his philological deficiencies in the field of the Semitic languages to a variety of unfounded hypotheses which will seriously impair the value of his work to theologians as well as to ethnologists. FRIEDRICH MÜLLER.

#### THE ENGLISH MSS. OF TERENCE USED BY LENG AND BENTLEY.

DR. FRANCIS UMPFENBACH, whose edition of Terence (Berlin, 1870) exhibits for the first time a complete collation of the most ancient MSS. of that author, including the Bembine, devotes an interesting article in the *Philologus* of this year (pp. 442-477) to a discussion on the MSS. not collated in his edition, but quoted by Lindenbrog, Leng, and Bentley. This discussion derives additional interest from the new light which Dr. Umpfenbach has thrown on the vexed question of the relation of the various families of Terentian MSS. to each other. Ritschl divided them into two classes: a more ancient, represented by the venerable Bembine, the Victorianus, and perhaps the Decurtatus; and a more modern, in which the recension of Calliopius, a grammarian of a comparatively late period, is followed. This theory is now disproved by the discovery that both the Victorianus and Decurtatus exhibit the Calliopian recension in a modified form, and corrected from the commentary of Donatus. This modified Calliopian recension appears also in parts of the Ambrosian, in the Vienna as well as in the Cologne fragments, and in the Laurentianus xxxviii. 27; it in fact constitutes a third family, distinct, on the one hand, from the Bembine, which stands alone in a class by itself, and, on the other, from the MSS. exhibiting the unmodified Calliopian recension. (See Umpfenbach's edition, pref. pp. i-iii, lxviii-lxix.)

After a discussion, more or less detailed, of the *vetus codex* of Lindenbrog, which A. Fritsch inclines to identify with a Paris codex now numbered 7905, and an article by Fritsch himself on the Codex Parisinus 7903A, a MS. belonging to that modified Calliopian group, of which the Victorianus and Decurtatus are the best known specimens, the English MSS. employed by Leng and Bentley are treated.

(1) Of the *Regii*, or MSS. in the King's Library, Bentley quotes several. The most valuable of these, described by him as *chartaceus sed ex optimo exemplari transcriptus*, is identified with a paper MS. of the fifteenth century now in the British Museum, and numbered Regius 15. A. xi.—a MS. of the modified Calliopian group, though differing from the Victorianus and Decurtatus in the order of the plays, which is that of the pure Calliopian recension, *Andria*, *Eunuchus*, *Heautontimorumenos*, *Adelphi*, *Hecyra*, *Phormio*. Where two *Regii* are mentioned, Dr. Umpfenbach considers it certain that the second is that marked 15. A. xii. of the tenth century; that he employed others as well seems rightly inferred from such expressions as *unus ex Regiis recentior* (see Bentley's note on *Hec.* v. 4, 12). Leng also used a MS. belonging to the King's Library; this, it would seem, was distinct from either of the two *Regii* above mentioned as Bentley's.

(2) Bentley speaks several times of a MS. which he calls *Academicus 900 annorum*. Among the MSS. which Leng used were two lent him by the Bishop of Norwich, which he styles severally *Na* and *Nß*. In the characteristic passages, *Ad. iii. 2, 26, animam; Phor. iii. 3, 16, tum igitur*; probably also in the omission of *Phor. ii. 3, 7, neque eius—negat*, Dr. Umpfenbach concludes that Bentley's *Academicus 900 annorum* is Leng's *Na*. The writer of this article is indebted to the kindness of Mr. J. E. B. Mayor, late Librarian of the University Library of Cambridge, and just appointed to the chair of Latin recently vacated by Professor Munro, for a collation of the only MS. in that library which can be supposed to represent Bentley's *Academicus 900 annorum*. It is marked Ff 6 4, and did actually belong to John Moore, Bishop of Norwich, as Mr. Mayor concludes from the book-plate *munificentia regia 1715*, and the signature *J. Norwicensis* which appears on the first page. But that it cannot be Bentley's 900-year codex is placed beyond all doubt by a comparison of the readings which follow with those quoted from Bentley by Umpfenbach, p. 467, even if it were not certain that Ff 6 4 was not written in the ninth century.

## READINGS OF Ff 6 4.

<i>Andria</i> . . . .	iv. 4	54	<i>volunp.</i>
	v. 4	25	<i>tibi not over erasure.</i>
<i>Eun.</i> . . . .	iv. 4	47	<i>ei oi.</i>
	" 7	19	<i>armis</i> without erasure.
<i>Heautont.</i> . .	i. 1	71	<i>incerto.</i>
	iii. 1	1	<i>lucescit.</i>
	" "	43	<i>Satrapes.</i>
	" "	48	<i>pitissando.</i>
	v. 1	4	<i>dicla.</i>
	" 3	6	<i>facid.</i>
<i>Ad.</i> . . . .	i. 1	16	<i>dissimili.</i>
	iii. 2	26	<i>animum.</i>
	" 3	68	<i>Demea</i> (without <i>o</i> ).
	" 4	5	<i>hac audinit.</i>
<i>Hec.</i> . . . .	iv. 4	1	<i>tibi quoque edepol sum iratus.</i>
<i>Pho.</i> . . . .	i. 4	15	<i>via.</i>
	" "	52	<i>deficies.</i>
	ii. 3	8	the line is not wanting.
	iii. 2	6	<i>An. ei metuo lenonem ne aliquid suo fuat capiti. Gz. idem timeo ego.</i>
	" "	41	<i>sterguiliunum.</i>
	" 3	16	<i>dum igitur.</i>
	iv. 3	14	<i>ut eius tentarem</i> [ <i>sic</i> , for the latter part of the MS. is a much later transcript] <i>sententiam.</i>
	" "	38	<i>libuit</i> (without interlineation).
	v. 3	9	<i>natam</i> (not after correction).

Nor, on the other hand, can the only other MS. of Terence now in the Cambridge University Library, that marked Ff 4 39, and which formed part of the original library given by Archbishop Rotherham, be the missing *Academicus*, for, besides that it does not agree in *And. iv. 4, 54; v. 4, 25; Eun. iv. 4, 57*, the three cardinal passages in which it was collated by Mr. Mayor, it cannot be older than the fifteenth century. (See pp. 472, 511, vol. ii. of the Catalogue of MSS. in the University Library of Cambridge.)

(3) Leng used for his edition (1701) a MS. belonging to Frevile Lambton, Esq., *ex agro Dunelmensi, i.e.* in the county of Durham. Frevile Lambton's pedigree may be found, as indicated to me by Mr. Mayor, in Surtees' *Durham*, iii. 36. He was buried August 28, 1731, *æet.* 70. He was owner of Hardwick Park, Sedgfield, in that county. The MS. which is called by Leng *Dunelmensis* had at the beginning of every scene coloured figures of the actors, and at the beginning of each play a pictured *aedicula* or small cabinet containing the masks. Two leaves were wanting, one containing *And. iii. 1*, the other *And. iv. 3*. Both Krauss and Brix agree in supposing this codex to be identical with that called by Bentley *veterimus*; it would be interesting to prove whether this conjecture is well founded; but the MS. has not been forthcoming for the last 150 years, and, like the far more valuable Cologne MS. of Silius Italicus, is perhaps no longer discoverable. Leng calls this much the finest of all his MSS. and any one who would bring the lost treasure to light would confer a service which would be appreciated by every student of Latin philology.

(4) After a short description of the *Petrusensis* and *C. C. C.*, the one belonging to Peterhouse, now St. Peter's College, the other to Corpus Christi College, Cambridge, two MSS. used by both Leng and Bentley, Dr. Umpfenbach comes to the *Ship-*

*penianus*, a MS. lent to Leng by Robert Shippen, Fellow (afterwards Principal) of Brasenose College, Oxford. Here, at any rate, we are able to clear up a doubt, for this MS. is certainly that now in the library of Brasenose, numbered xviii. in Cox's Catalogue (*Catalogus Codicum MSS. qui in Collegiis Aulisque Oxoniensibus hodie adservantur*, Oxonii, 1852), and assigned by him to the eleventh century.

Of the other codices of Terence briefly noticed in the *Philologus*, nothing need be said. The Oxford *Donatus*, occasionally cited by Bentley, may be No. xlv. in the library of Lincoln College, a parchment MS. of the fifteenth century: it is perhaps more probable that it was one of those in the Bodleian.

R. ELLIS.

## UNIVERSITY ORGANIZATION.

SOME scientific men, and some resident and other members of the Universities of Oxford and Cambridge, have been holding a conference to consider the low state of learning and science in the two older universities—its causes and its remedies. The impulse to the movement at this particular time has been given by the commission which is now enquiring into the revenues of the colleges, and which is expected to report next session. The wildest and most diverse schemes are floating in the air for the appropriation of these endowments, each of which schemes will no doubt find backers when the time comes. The fear is that there may be a scramble, and that a government dependent for its existence on a House of Commons majority may find it expedient to distribute the treasure-trove among the clamorous. The friends of learning and science, who might not unreasonably claim the whole, come forward asking to be first considered. They based their combination and their further proceedings upon a resolution which ran in these words:—

"The chief end to be kept in view in any redistribution of the revenues of Oxford and Cambridge is the adequate maintenance of mature study and scientific research, as well for their own sakes, as with the view of bringing the highest education within reach of all who are desirous to profit by it."

This resolution was signed by about seventy names, and was followed up by a conference or consultation of the persons signing, as to the development which should be given to the general proposition thus affirmed. The meeting was held at the Freemasons' Tavern on the 9th November. Among those who took a part in the proceedings were Sir Benjamin Brodie, Drs. Carpenter, Burdon-Sanderson, Appleton; Professors Rolleston, Huxley, Seeley, Clifford, Robinson Ellis, Thiselton Dyer; Messrs. Mark Pattison (Rector of Lincoln College), Ray Lankester, Henry Sidgwick, Newton (of the British Museum), A. J. Ellis, Sayce, Bywater, Sidney Colvin, Simcox, Cheyne, &c.

A discussion was taken on the following topics:—Research in Physical Science compared with that in other sciences in England; National Importance of Mature Study as a means of increasing Knowledge; Importance of Research as improving the Quality of Education; the Abolition of Prize Fellowships; Necessity of an Increase in the Number of Professors; the Introduction of new Branches of Study, *e.g.* Archaeology; the better Organization of the Teaching in the already existing Branches; &c.

It was distinctly stated in the course of discussion that this was not a political movement, and that its object was not to back up the present, or any, government in any political measure. Those present were there to consider purely academic and scientific interests. Great dissatisfaction was expressed at the present bestowal of the endowments. An annual revenue, vaguely estimated at 170,000*l.*, is spent in educating about 2000 students. Of these two thousand, it is a low estimate that more than half are "passmen," and passmen may be said to learn nothing worth learning, but spend three years in arriving at the degree of a B.A. Of the other, and smaller, half of the student body, the education is more or less successful. But there was not the same unanimity as to the exact value to be assigned to the results of the education of the "honour" students. Dr. Rolleston thought that great advantage was obtained for the public, by passing a number of mediocre men through a mill which makes them useful machines in their country. At the same time he intimated that examinations for fellowships, where the candidates were older, and therefore ought to have made special studies, was an unsatisfactory repetition of the examination for degree.

He thought that examination was in its place and useful as a stimulus for younger pupils.

Dr. Carpenter dwelt on the necessity of providing a maintenance for men whose hearts were in the work of research. If England was behind Germany in original investigation, it was not, as is sometimes said, because Englishmen are inferior to Germans in ideal power, but because the German universities are so arranged as to afford a career to men who choose to devote their lives to study. In England such young men, having no means of making a livelihood by the pursuit of science, are obliged to turn their attention to a "practical" profession.

Sir Benjamin Brodie wished to found in the universities certain specific institutions for the promotion of scientific research. He knew we should be told that this was not an object about which the nation should care. But he pointed to certain institutions which England does keep up, and at very considerable cost, which have solely science for their object. Such are the Royal Observatory at Greenwich; the Meteorological Observatory at Kew, and, above all, the British Museum. The universities with all the means at their disposal did nothing of this kind, the Radcliffe Observatory and the Bodleian Library at Oxford being both private foundations. He would not trust to the growth of professorships singly, but would like to see certain specific institutions representing the various departments of human knowledge. Such institutions should not be disconnected from the work of teaching, but should fulfil the very highest educational work, viz. the training up for the service of the country a body of teachers in the respective sciences.

Professor Seeley argued the uselessness of the fellowships as at present bestowed. He met the argument usually urged by the defenders of fellowships, viz. that they give talent a start in life, by asking why the professions should be specially provided with such advantages rather than any other career? The fellows of colleges were not a class of men with whom any fault can be found. They are all occupying themselves in some way usefully, only not in science, learning, or mature study.

The Rector of Lincoln deprecated the notion of pulling down the present tuitional system, and setting up a professorial in its place. This was the idea of the Commission of 1854, and it had proved an entire failure at Oxford. The tutors had beaten the professors out of the field: for the tutors kept tight hold of the university examinations, and with this powerful leverage to work with, they made it impossible for a professor who gave instruction in the higher parts of his subject to get a class to attend him. He wished to set about reform not by destroying the existing teaching machinery, but by raising its level. Nor would he abolish the fellowships, but convert them. The present mode of bestowing fellowships was indefensible. A fellow had no duties. He would convert the college fellowships into a body of teachers, on a graduated scale, so arranged that the whole body should be connected with education; but while the lowest grade should be wholly occupied in teaching, the highest grade, to rise to which time would be required, should be exempt from the drudgery of lecturing. In this way only could the love of learning and the spirit of research be introduced among the tutors. The best of the tutors felt keenly the pernicious effect of the grind to which they were at present subjected, and would gladly be relieved from it. But the system was too strong for them. As to the proposal of affiliating colleges, or sending teachers out of the universities to the centres of population, he should not see any objection to doing so, provided that these branches were in close connection with the organized hierarchy of instructors whom he would set up in the place of the college fellows.

Mr. Newton urged the desirability of introducing the study of Archaeology into the universities, of organizing it in connection with the existing collections, and of reuniting it to the pursuit of historical research. The study of archaeology requires, first, museums where practical acquaintance can be made with the monuments, and curators for the charge of those museums; and, next, professors to bring before students the last results of archaeology throughout Europe. The British government and private enterprise had done much for the collection of archaeological materials in this country. Their systematic employment was a task which ought to be fulfilled by the universities.

After the discussion, which was broken off at this point by the lateness of the hour, the persons present agreed to form themselves into a "Society for the Organization of Academical Study."

## Intelligence.

The last number of the *Altpreussische Monatsschrift* (vol. ix. parts 5 and 6) has an interesting though somewhat superficial account of the High German dialect of East Prussia, by G. Hoffheinz. It appears to be of a highly composite character. Not only has it been strongly modified by the Low German of the bulk of the earliest colonists, but has also adopted many words from the Slavonic dialects of the original inhabitants. It is important to observe that the writer distinguishes between the *j* of *Jeist* and that of *Jott* (= *Geist* and *Gott*), the former being a pure *j*, the latter a more guttural sound, which precise one it is impossible to tell from his account. Here, as elsewhere, the weakness of his phonetics is to be regretted. Thus, after stating that *s* before *t* and *p* becomes *sch*, he goes on to say that the same is the case in the pronunciation of Greek, which he expresses by writing *σχπουδη* for *σπουδη*!

A new review has been set on foot at Hongkong, under the title of *The China Review*. It is edited by Mr. N. B. Dennys, the former editor of *Notes and Queries on China and Japan*, the extinction of which useful serial has been so much regretted. The place of honour in the first number is given to a paper on Dr. Legge's *Shikking*, by the Rev. E. J. Eitel. The review is intended to appear every two months.

A new edition of the *Mahabhashya*, Patanjali's great commentary on the grammatical Sūtras of Pāṇini, with the commentary called *Bhashya-pradīpa*, and a new commentary by Pandit Rajarama, from the Benares College, has just been published in that city. This is the first complete edition of this important work ever printed; as the late Dr. Ballantyne's edition comprises only the fourth part of the first *Adhyāya*, and therefore only the thirty-second part of the above complete edition.—*Trübner's Record*.

The *Göttingische gelehrte Anzeigen*, No. 44, contains a review of recent works on the Assyrian language and antiquities by Schrader, Sayce, Lenormant, and Finzi. The well-known writer who signs himself H. E. expresses himself without the slightest reserve in favour of the decipherers of the inscriptions, and only exhorts them to caution in the comparison of other languages. H. E. differs from Professor Schrader (*Academy*, vol. iii. p. 340) in ascribing but little scientific value to the syntax in Mr. Sayce's grammar; the reader will do well to verify H. E.'s report of the contents of that book for himself.

On December 3, Mr. George Smith, of the British Museum, will read a paper before the Society of Biblical Archaeology on "A Cuneiform Inscription containing the Chaldaean Account of the Deluge." We hope this important text, which is said to resemble the story in Berosus, will be published as early as possible. It is on one of the clay-tablets found by Mr. Loftus at Warka.

M. de Campos Leyza has written a *Clef de l'Interprétation hébraïque* in 612 large octavo pages (Paris: Maisonneuve). He there "demonstrates" that there are about fifty fundamental roots, of which about forty are onomatopoeic. The work, we regret to say, is absurdly unscientific, and only shows how much the study of Hebrew in France lags behind that of other Oriental languages.

## Contents of the Journals.

*Jüdische Zeitschrift* (Geiger), vol. x. No. 4.—The Prefaces of Saadia to *Agron* and *Galuj*. [Based on an account by Firkowitsch of the newly discovered prefaces to Saadia's lost works, *Agron* and *Galuj*. The Hebrew prefaces (there is also an Arabic one) to the former work is also given in full from the Hebrew serial *Lebanon*. Firkowitsch states that he also possesses other works of Saadia, including a fragment of his commentary on the Pentateuch.]—On the Moabite Inscription; by J. Auerbach. [Reads, l. 17, 18, *וַיִּהְיוּ וְאֶסְרָף* (כל or את), i. e. "Mesha burnt all the Levites of Jehovah before Chemosh;" *לוי* = *לוי*: cf. Olshausen, *Lehrbuch*, p. 413. Geiger also proposes to read, l. 13, 14, *אֵשׁ חֶרֶת* "the men of Chereth": cf. 1 Sam. xxii. 5.]—On Jer. xx. 17, *חֶרֶת*, not st. const. of *חֶרֶת*, but a noun, found in *Berachoth*, 44b, 57b, *Abodath Elihin*, 29a = "womb."]—An Unknown Commentary on Sifra; by M. Steinschneider. [MS. No. 59 at Munich.]

The essential point of Pasteur's communication consisted in regarding any portion of a living organism when deprived of access to oxygen as capable of acting as a ferment in respect to fermentable substances in contact with it.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 62.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The Editor cannot reply to questions from authors respecting the notice of their books.*

*The next number will be published on Wednesday, January 1, and Advertisements should be sent in by December 28.*

## NOTICE TO SUBSCRIBERS.

This Number completes the Third Volume of THE ACADEMY: which will be ready by the 1st of January, comprising 24 Numbers, bound in cloth, price 18s. Covers may then be had of the Publishers, price 2s. The Index and Title-page will be published with the next Number, January 1.

## General Literature.

**Love is Enough; or, The Freeing of Pharamond a Morality.**  
By William Morris. Ellis and White, 1873.

THE conception and arrangement of Mr. Morris' last poem are singularly refined and perfect; and it is written throughout with an intensity and seriousness which many readers will be inclined to contrast favourably with the half querulous half indolent *insouciance* which runs through much of the *Earthly Paradise*, and finds a definite expression in the *Apology* and *L'Envoi*. The poem begins with a conversation between Giles and Joan, who are two married peasants, in a crowd at the pageant of an emperor's marriage. They speak in octosyllabic couplets, and the imagery of their speeches is homely, and Joan mistakes the marshal's sergeant for a knight: otherwise it may be doubted whether any peasants out of Arcadia ever expressed themselves with such elegant simplicity and propriety. Then after a short song, which, like all in the poem, begins with the words, "Love is Enough," the emperor and empress appear and exchange lofty courtesies about their love in heroic triplets, each of which is followed by a burden. Then we have the mayor in alliterative lines begging leave to present a play. He feels called to apologize for the subject, which seems to depreciate rank and prosperity; as equally of course he regards the rank of the emperor and empress with loyal complacency; equally of course they give a gracious dispensation for the play to proceed.

The story of the play deals with familiar elements; but they are treated in an abstract passionate way that is anything but familiar. Pharamond succeeds his father, who is killed in battle, and for five years works wonders in defence of his kingdom. Through all these years he has been haunted by the vision of a maiden in a valley shut in by mountains, over which the only pass lies through a yew wood. At last he breaks down under his longing; and, after passing nine days in lethargy, sets off with his foster-father to find the reality of the vision. It seems they met with many adventures in their search; but these are only used for a scene of dreamy reminiscences; it is hardly worth while to enquire which come from Calprénede, which were invented for a story which upon reflection the poet did not care to tell. It

VOL. III.—NO. 62.

is not till the search has lasted for years, and hope has failed, that Love reveals himself, and then withdraws to make way for the beloved in the very valley of the vision where Pharamond has lain down in a mist to die. While Pharamond has been longing for her, Azalais has been longing, not yet for him, but for love; and so when she sees him, she too recognises that she has been longing for the meeting.

After the first raptures are over, Pharamond, to please his foster-father, and to gratify his natural self, or what is left of it, goes back to his kingdom to resume it if he can. He finds that Theobald the constable (whose *lâches* did much to aggravate his early difficulties) has usurped the throne to the general satisfaction. Accordingly he goes back to his love under the impression that he is too good for a king, and that there would be little pleasure in conquering his subjects after conquering their enemies. The emperor and empress are much pleased with the play, and wish in vain that they could make friends with the players; but they are cut off by their rank from a felicity which is reserved for Giles and Joan. After each scene there is a musical interlude, which becomes more and more like a hymn; and Love delivers an address to the audience, which becomes more and more like a sermon by a saint; and the talk of Giles and Joan as they go home from the show lets the reader down gently and happily to common life again.

When we pass from the conception to the execution, it is impossible to speak too highly of the rich rapturous melody of the songs, which are all in long anapaestic stanzas with double rhymes, that have an echo here and there of Mr. Swinburne—perhaps inevitable, but hardly welcome. We extract the last and the sweetest:—

"LOVE IS ENOUGH! Ho ye who seek saving,  
Go no further; come hither; there have been who have found it,  
And these know the House of Fulfilment of Craving;  
These know the Cup with the Roses around it;  
These know the World's Wound and the balm that hath bound it:  
Cry out, the world heedeth not, 'Love, lead us home!'  
He leadeth, He hearkeneth, He cometh to you-ward;  
Set your faces as steel to the fears that assemble  
Round his god for the faint, and his scourge for the forward:  
Lo his lips, how with tales of last kisses they tremble!  
Lo his eyes of all round that may not dissemble!  
Cry out, for he heedeth, 'O Love, lead us home!'  
O hearken the words of his voice of compassion:  
'Come, cling round about me, ye faithful who sicken  
Of the weary unrest and the world's passing fashion!  
As the rain in mid-morning your troubles shall thicken,  
But surely within you some Godhead shall quicken,  
As you cry to me heeding, and leading you home.  
Come—pain ye shall have, and be blind to the ending!  
Come—fear ye shall have, mid the sky's overcasting!  
Come—change ye shall have, for far are ye wending!  
Come—no crown ye shall have for your thirst and your fasting,  
But the kissed lips of Love and fair life everlasting!  
Cry out, for one heedeth who leadeth you home.  
Is he gone, was he with us?—ho ye who seek saving,  
Go no further; come hither; for have we not found it?  
Here is the House of Fulfilment of Craving;  
Here is the Cup with the Roses around it,  
The World's Wound well healed, and the balm that hath bound it:  
Cry out! for he heedeth, fair Love, that led home."

The following lines are perhaps as fair a sample as can be isolated of the tone and doctrine of Love's discourses:—

"Have faith, and crave and suffer, and all ye  
The many mansions of my house shall see  
In all content: cast shame and pride away,  
Let honour gild the world's eventless day,  
Shrink not from change, and shudder not at crime,  
Leave lies to rattle in the sieve of Time!  
Then, whatsoe'er your work-day gear shall stain,  
Of me a wedding-garment shall ye gain

No God shall dare cry out at, when at last  
Your time of ignorance is overpast ;  
A wedding-garment and a glorious seat  
Within my household, e'en as yet be meet."

The last line seems hardly finished ; and there are other indications here and there that Mr. Morris has lost something of his easy mastery in abandoning the ruder form of the heroic couplet which he inherited from Chaucer. The writer himself seems to be aware of a more serious fault : with all his gracious delightful fervour, Love argues and insists too much ; his discourses are not merely a commentary on the poem, they are a defence of it, almost a criticism ; and it is only a very youthful literature which is ingenuous enough to permit itself such confidences. Perhaps, too, it might be said that the several disguises of Love, who sometimes appears as a maker of images, sometimes as a maker of pictured cloths, have little value for the reader ; though, if there could be found worthy actors and a fit audience, they would add another grace to the pageant.

It is hard to pronounce upon a single trial whether the revival of alliterative rhythm will be a permanent addition to our poetical resources. We are inclined to think that Mr. Morris himself has gained by it a greater directness and energy of expression, and consequently more of the eloquence of passion, and this without any sacrifice of delicacy ; but after all he has not yet shaken our impression that the harmony of regular metre was a decided artistic progress.

Here is an extract from the speech of Azalais, as she sees Pharamond asleep :—

"As one hearkening a story, I wonder what cometh,  
And in what wise my voice to our homestead shall bid him.  
O heart, how thou faintest with hope of the gladness  
I may have for a little if there he abide.  
Soft there shalt thou sleep, love, and sweet shall thy dreams be,  
And sweet thy awaking amidst of the wonder  
Where thou art, who is nigh thee—and then, when thou seest  
How the rose-boughs hang in o'er the little loft window,  
And the blue bowl with roses is close to thine hand,  
And over thy bed is the quilt sewn with lilies,  
And the loft is hung round with the green Southland hangings,  
And all smelleth sweet as the low door is opened,  
And thou turnest to see me there standing, and holding  
Such dainties as may be thy new hunger to stay—  
Then well may I hope that thou wilt not remember  
Thine old woes for a moment in the freshness and pleasure,  
And that I shall be part of thy rest for a little."

Perhaps the anapaestic movement is here as elsewhere too unbroken, indeed there are whole paragraphs that only want rhymes to remind us of Mr. Swinburne when he writes in a minor key. But we feel it is ungracious to criticize music at once so rich and so simple : the idyllic grace of Azalais' awaking shyly to the consciousness of love furnishes the ideal relief after the passionate scene in which Pharamond's hushed intense expectation passes through sweet music into the trance in which she finds him.

The charm of the *Earthly Paradise* was that it gave us the picturesqueness of earth with the atmosphere of fairyland ; we drifted along a swift current of adventure under a sky heavy with sweet dreams, through which the dew of death fell without dimming the sunshine : we were amused and yet enthralled. In his new work Mr. Morris demands more of the reader ; instead of abandoning himself to a passive fascination, he has to be penetrated with a profound and earnest passion : we have to live in the poem, not to dream of it. Consequently it will not be surprising if *Love is Enough* attracts fewer readers than the *Earthly Paradise* ; though those who are attracted will be held longer under a deeper spell. Those outside the charmed circle will perhaps complain that the figures which move within are shadowy, because their own desire does not burn within them.

G. A. SIMCOX.

Björnson's *Sigurd the Crusader*. [*Sigurd Jorsalfar*. Af Björnstjerne Björnson.] Copenhagen : Hegel.

THIS drama is what is called "a piece for the people," *folke-stykke*, that is to say, a work which addresses all classes, of whatever culture, of whatever age, and which aims at linking them all together in the sympathetic remembrance of glory in the past. Björnson is a consistent, though a violent, democrat, and lays his art at the feet of the people, giving them a stage-play which they can understand, and which will ennoble them. Such is his aim ; but, being a true artist, he cannot be bound by his own theories even, and what he writes, though on the surface patent to all, in truth demands a subtle and cultivated attention to appeal to.

A Jorsalfar was a man who had performed the pilgrimage to Jerusalem or Jorsalir ; such a man was called in Icelandic Jorsala-fari, or Jerusalem-farer, whence the Norwegian form Jorsalfar. Several heroes in the Sagas bear this appellation, but none equal in fame the great King Sigurd Magnusson. In his day, Norway was reigned over by two rulers, bearing joint power. For Magnus, dying, had left his crown to his sons Eystejn and Sigurd, to be worn by each. But one crown will not cover two heads ; the brothers jarred and quarrelled, and the unification so laboriously won by Harald Fair-hair seemed on the point of being lost. Then Sigurd, wild for travel, threw up the reins of government and sailed into the south. In Morocco, in Spain, in Apulia, he won renown ; eight times he smote the heathen and stormed Sidon ; before the tomb of Christ he knelt, and swam over Jordan. Then his silken sails flew up the Levant, and his glory culminated in a splendid entrance into the imperial city of Micklegarth. All this while Eystejn had made laws, built churches, laid down roads, protected fisheries, and with fair words won the lost province of Jæmteland. Back came Sigurd, insolent with success, and by his wonderful achievements dazzled the eyes of all. Again the brothers, Eystejn, the modern man of progress, Sigurd, the type of a mediæval warrior, clashed and differed. The match that lit the train was an outrage committed by one of Sigurd's men, and with this begins the drama.

A Jorsalfar of Sigurd's had killed one of Eystejn's men ; and in the first scene before us, he tries to steal the dead man's bride out of the palace. He is caught and shut up in prison, and Sigurd chooses to consider this a personal insult to himself. The greater part of the first act is taken up with the excited conversation which the alarming position of affairs draws from Sigurd's warriors. We learn incidentally that Borghild, the fairest woman in Norway, has been long promised marriage by King Eystejn, but that he has delayed so many months that she has suffered shame of it, and immediately it appears that Sigurd will make her the instrument of his revenge. Suddenly the scene changes, and we are in the house of Borghild at Dal. She is alone, at night ; weary with waiting, shamed in her love. Like another Mariana, she is ready to die of weary waiting. Sigurd, unannounced, presents himself to her, splendid and masculine, like a sea-eagle bathed in sunset colour, with the gold and the silk of the East upon him. The dialogue here becomes masterly. He offers her his hand and a seat on the throne by his side ; he appeals to their joint grudge against Eystejn, to her sense of his neglect, and, pleading passionately with her, wins her. All combines to fight against her constancy : her weariness, pique, and shame, the vigorous beauty of Sigurd so suddenly presented before her, conquer her resolve, and she flies with him. At the very moment, the horsehoofs of messengers from Eystejn, bringing a bridal escort for her, clatter into the courtyard, but it is too late.

In the next act, the brothers quarrel in open hall over

the beer-horns. To prove his triumph, Sigurd commands Borghild to be led in, gorgeously attired, surrounded by her maidens. Sigurd, sure of his point, calls upon her to choose between them, and she, still resentful, instantly prefers himself. But as Eysteijn goes, he speaks a word of grave sorrow to her, and her heart relents. The old passion floods her heart again; she turns to Sigurd: "You thought I loved you? Ha! ha! I took you only as poison to destroy my love for him!" When he approaches her, she swoons with horror. Sigurd turns mad with baffled passion and the sense of failure which is death to men of his stamp. When he recovers his senses, he resolves on a new voyage to chase away chagrin, but just before he starts, he has a meeting with his brother; old grievances are removed, old wounds healed, and instead of faring out over seas again, he stays at home and helps Eysteijn in his plans of social progress. We are not told what becomes of Borghild.

Such is *Sigurd Jorsalfar*, a poem with some incongruities of ancient practices and modern theory, and a mere sketch at best. Still it is a sketch by a master, and in itself masterly, with much excellent by-play that it is not possible to be just to in a short review.

EDMUND W. GOSSE.

**Hamann's Life and Works.** [*Johann Georg Hamann's Schriften und Briefe. Zu leichterem Verständniss im Zusammenhange seines Lebens erläutert und herausgegeben von Moritz Petri.*] Parts I and 2. Hanover: Carl Meyer.

THE complaint that Hamann's life and writings are not so well known or so highly valued as they ought to be has been repeated so often as almost to answer itself. A writer who has been rediscovered with enthusiasm several times during the last half-century, whose works have been collected into eight volumes, whose life has been written in three or rather in five volumes, whose monument has been restored at government expense, who occupies a page in the *Biographie universelle*, and a chapter in any German history of literature, cannot exactly be said to suffer from neglect. One admirer, who has published a *Fingerpost to Hamann*, says that in all his acquaintance he can count but ten grown men who know anything of Hamann, and that the youth of the day are not anxious to be better informed than their fathers. It does not occur to Herr Disselhoff that the result might be nearly as distressing if he were to enquire after readers who had conscientiously studied at first hand other more famous and less obscure authors of Hamann's day—Herder and Jacobi themselves, to say nothing of Mendelssohn, or Moser, or Hippel. The fact is that nothing will ever make Hamann popular, while his eminence is already conceded on all hands. Even his self-elected champions do little to increase his fame, because the difficulty of his writings, both in style and substance, is not to be explained away by pious admiration: it is easy to agree with him without understanding him, very difficult to understand him, as Goethe did, without agreeing with him, and yet hardly worth while to agree with him merely for the sake of fathoming his oracles, or of being persuaded that they were worth fathoming. Most of the modern essays, lectures, and the like, devoted to the "Magus of the North" open with what is very like a list of testimonials, the expressions of opinion by men who knew Hamann, or were capable of appreciating his real and singular genius, valuable in themselves and in a way conclusive, but not a substitute for a complete and adequate representation of his personality as it appears in the altered light of another century. Every writer on Hamann quotes Goethe's most just and penetrating sentences; but if nothing can be added to them, why write a book? As criticism they are very nearly sufficient, but if the object is only to make the present

generation acquainted with the person of him who called them forth, it seems to us that two useful things might be done. The only edition of his works is that published by Roth in 1818, very uninviting as to paper and type, with letters and pamphlets chronologically intermingled, and no notes. The only complete account of his life is in Gilde-meister's conscientious, voluminous, and thoroughly unreadable work, in which, again, letters, extracts from his works, and biographical details succeed each other in historical order, on the ground that his life and writings are necessary to explain each other. Herr Petri proposes to follow a similar course, the only difference being that he publishes the works *in extenso* amongst the letters and notices; but the principle seems to be altogether a mistaken one. Hamann's writings may be worth reprinting; if so, they certainly require an elaborate series of explanatory notes: his language was a riddle to begin with. Conceive the style of Carlyle or Richter, their native obscurities of diction enhanced by tags of Hebrew and a little Arabic, and used to express the profound and startling theological conceptions passing through what we may call a stammering brain, an active and powerful mind with the one drawback, an impediment in its speech; hence a circuitous, allusive way of saying what in itself might not be unintelligible; and an editor would have enough to do who undertook to restore the significance of all the apparently unimportant phrases, which refer, perhaps, to a forgotten criticism, by a forgotten critic, of a forgotten author, and are meaningless without a knowledge of the whole train of ideas associated in Hamann's mind at the moment of writing. And this would be only half the annotator's work, for the fugitive sheets and occasional pamphlets which make the bulk of Hamann's authorship stand in the closest relation to some of the most influential writings of his time; they represent the rebound from the dominant sentiment of the moment, but with an intricate refinement, an intellectual fantasticalness which makes a "fingerpost" by no means superfluous to decide even the elementary question whom or what the Magus means to destroy by a given spell. We can easily conceive a German editor, with the patience, the learning, and the insight into the intellectual life of the last century necessary to make Hamann's works intelligible in this way, but such an undertaking could not have the smallest pretension to popularity; its value would be real, but restricted to the class of literary and religious antiquarians. This, however, refers only to the writings published during the author's life: his letters, much the most intelligible, the most interesting, and not the least able of his compositions, require far less explanation, and, if reprinted by themselves, in a convenient form, would probably find access to a larger circle of readers than Hamann has ever yet obtained. The other desideratum will be easily supplied whenever Germany has a Sainte-Beuve; the main facts of Hamann's life are well known, there are ample data for passing judgment on his character, his person is reflected in his works, but it is given to few to see what is in sight; we want a portrait to help us to recognise all the slighter lines and lights and shadows, in the face of the original, and this is especially the case with uncommon features and a mobile expression. A thin pamphlet, by C. Carvacchi, *Biographische Erinnerungen an J. G. Hamann*, gives the most readable and compendious account of his life that has been published, but a "portrait," a literary biography of moderate dimensions and polished form, is conspicuous by its absence.

The first part of Herr Petri's work includes letters down to 1759, and Hamann's first literary undertaking, the *Socratiche Denkwürdigkeiten*, published in the same year.

For this period, the present work is more complete and luminous than Gildemeister's in the biographical portions, but the notes on the *Denkwürdigkeiten* resemble nothing so much as the paraphrases of Holy Scripture sometimes published, by ill advice, for the perusal of Evangelical children, and do not allow us to hope much from the assistance of such an editor in unravelling the yet more profound perplexities of his later productions. Johann Georg Hamann was born in 1730, one of the two sons of a respectable and pious Königsberg doctor. He was carefully educated, if anything, too carefully, in ancient and modern languages, theology, mathematics, music, and other accomplishments, for the artificial breadth of interests given to him as a mere youth no doubt made it more difficult for him to fix on the choice of a profession, which would take him from the learned leisure of his father's house. Ultimately (in 1752) he decided for tuition, partly because he had educational theories, partly because his acquirements would be less useless to him than in other vocations, and chiefly because he wished to travel and see the world. A friend procured him the post of tutor to a young baron of nine, resident with a widowed mother at Riga. A short experience of his office discouraged Hamann, who wished "for a mind to form, and found a spoilt and idle baby"; he wrote to his pupil's mother a letter detailing his views, grievances, and wishes, with rather unparliamentary frankness, and in return was still more unceremoniously invited to leave the house. His zeal, no doubt, had been greater than his discretion, but his good will was acknowledged by a brother of the ungrateful baroness, who procured him a more eligible tutorship with a noble family in Courland. Here his character and abilities were valued as they deserved, but he was not happy in his office, so far as we can judge, only because there is a period of irritable arrogance in the development of most remarkable men, during which it is impossible for them to be happy anywhere. He resigned his post at the end of a year, and, returning to Riga, was domesticated in the house of a Königsberg fellow-student, now a merchant, Berens by name, who tried to interest him in the social and political importance of commercial pursuits, and led him to translate a French book by Dangeuil on the latter subject. Here he lived happily, bought books, and ran into debt, so that he was glad to accept a flattering invitation to return to Courland on his own terms. Still restless and discontented, he took the opportunity of a summons to his mother's death-bed to break off finally from an engagement that was burdensome to him, and (in 1756) to form fresh ties of a rather mysterious nature with the Berens family. There were four sons, to the youngest of whom Hamann had occasionally acted as tutor; the third, Christopher, was his most intimate friend, a man of wide culture, knowledge of the world, and an ardent advocate of all the new lights of the *Aufklärung*; the brothers had a sincere regard and a high admiration for Hamann, to whom they offered employment as foreign clerk and travelling agent, thus leading the way to his English expedition, the turning-point in his life.

After his mother's death, he paid a short visit to Berlin, and entered into personal relations with the chief *littérateurs* of the capital, then proceeded, *via* Amsterdam, with funds supplied by the Berens, to London, where, according to his own account (the only one we possess), he had weighty communications to make to the Russian ambassador and other important personages. Whatever his business may have been, he failed entirely in its discharge; he fell into bad company, spent all his money, led a disorderly life, solaced apparently by a confused hope of converting his associates, held no communication with his family or employers, and was in a fair way of becoming bankrupt at once

in health, honesty, and purse, when, by a sudden resolution, on the 8th of February 1758, he took lodgings with "Mr. Collins in Marlborough Street," began to live on gruel, and bought a Bible. Up to this time his life and opinions had certainly not been as Evangelical as his habitual phraseology, which by itself might have excused Gervinus' charge that "the traditional Königsberg pietism infected him like a plague." At Riga his Christianity had been dormant, and Berens had seen in him a possible and a valuable convert to the spirit of the age, but after his career of debauchery, in the artificial loneliness of his London lodgings, the prodigal son awoke to the error of his ways, and has recorded the consequent searchings of heart under the title *Gedanken über meinen Lebenslauf*, dated April 1758. Having bought a Bible, he began to read the Old Testament through methodically, and the first glimpse we have of the Hamann to be hereafter known to letters is his discovery, not that the history of the Jews is the type of the Christian's trials and temptations, which has been said before, and is not more exciting than an ordinary sermon, but that the career of the chosen people was a close reflection and living prophecy of the spiritual history of him, Johann Georg Hamann, with whose salvation, therefore, God had been incessantly concerned since the beginning of the world. Stories of sudden conversion are, as a rule, monotonous, but the following is original enough to deserve quotation:—

"In the books of Moses I made the strange discovery that the Jews, however unruly a people they seem to us, yet in some cases asked nothing from God but that which He desired to do for them, that they acknowledged their disobedience as readily as any penitent sinner, and yet forgot their sorrow as speedily again, and all the while called only for a redeemer, an intercessor, a mediator, without whose help they could neither fear nor love God as they ought. In the midst of these considerations, which seemed to me very mysterious, I was reading the fifth chapter of the fifth book of Moses on the evening of the 31st of March. I fell into a deep meditation, and I thought of Abel, of whom God said: 'The earth hath opened her mouth to receive thy brother's blood.' I felt my heart beat, I heard a voice in the depths thereof sighing and groaning, like the voice of blood, like the voice of a murdered brother, whose blood would be avenged if I did not give heed to it in time, and continued to stop my ears against it;—the voice that made Cain a fugitive and a vagabond. I felt all at once my heart melt, it overflowed into tears, and I could no longer — no longer conceal from my God that I was the murderer of my brother, the murderer of my brother His only begotten Son."

It has been observed that his sense of spiritual depravity did not quicken his sense of remorse for more ordinary transgressions, but it would not be fair to draw an inference from thence against his sincerity. It is good Christian doctrine that Hamann's sins *were* forgiven on the 31st of March 1758; and though the ungodly may find it hard to suppress a smile when, on the following page, he argues that, as God has forgiven him his sins, surely Berens may be expected to forgive him his debts, it would be the height of injustice to set him down as a hypocrite. Hamann was a curious mixture of fanaticism and common sense, but he was strictly upright and honourable in worldly matters, and even his piety was free from the admixture of charlatanism which disfigures the religion of Lavater and Jung Stilling. His doctrines were dangerous because a very strong and lively conviction that a child of God can do no wrong tempts the erring saint to remove the landmarks of right and wrong in other cases besides his own; but Hamann's nature was sound and healthy at bottom, and, except perhaps in one particular, his conduct was changed only for the better by the sanctification of his natural self-esteem.

After his conversion he found friends who enabled him to return to Riga, where the Berens received him with un-diminished friendliness, and a present from his father enabled him to discharge some of the debts which, faithful notwithstanding, continued to burden his secular conscience.

His letters to Dr. Lindner—third in the triumvirate of friends with Hamann and Christopher Berens—are our only guide to the gradual change of sentiments, almost, but never quite, leading to an actual breach between the two last. In spite of his originality and independence of mind, Hamann—and it is one of the amiable sides of his character—always felt the want of a friend to whom to confide his overflowing emotions, but the emotions which occupied him on his return from London were particularly distasteful to Berens; and Lindner, although an ecclesiastic, and a judicious mediator between the two, obviously had most sympathy with Berens. Phrases like “Let him have his business, let me keep my leisure;” “Whether I found the newest sect, or he the greatest firm; *sottise de deux parts*,” seem to give the key of the disagreement. And it is evident that, in the then overstrained state of Hamann’s mind, he must have been a puzzle, and not a pleasant one, to his sober friends. But their complaints against him were only of sentiment and language; their esteem continued, and even a distant affection, while in money matters the Berens’ generosity nearly justified Hamann’s pious reliance on Providence. A separation was decided upon when Hamann proposed to marry his friend’s sister, without any particular affection, it would seem, and in spite of their discordant views, reasoning, with an ambiguous affectation of candour, that they should not neglect means for his conversion—and what better means than a believing wife for an unbelieving husband, “or *vice versa*, as St. Paul says?” He is perfectly free from “venom or doubleness,” but his first concern is with his own soul, and he rides roughshod over his friend’s prejudices; when he has given offence, he claims to have it forgiven for friendship’s sake or Christian charity, and feels more strongly the present duty of his friend than his own past shortcoming; in the midst of sensible answers to a criticism of which perhaps he acknowledges the fairness, he will fly off into a tirade of Pauline humility, or cut the discussion short with an irrelevant text, “Who art thou that judgest? it is Christ that died,” or the like. In fact, the whole correspondence of this date is a most singular study of what we may call sentimental Antinomianism.

On the rejection of his suit, he returned to Königsberg, and, living with his father, spent his time in reading, or rather devouring, everything—from the Koran to Humphry Clinker—that he could lay his hands upon. In 1759, at the instigation of Kant and Berens, he published his *Socratische Denkwürdigkeiten*, which, however, was not calculated to give much satisfaction to those friends, the “two” alluded to in the motto, “*Vel duo vel nemo*.” The style is execrable, but the meaning made an impression on the few who fathomed it, and it was favourably noticed at Berlin, where probably that condition had not been fulfilled. The general drift is to shadow forth a parallel between Socrates and the Sophists and Hamann and the philosophers *à la mode de Sanssouci*, and again between the Socratic ignorance and the Gospel “poor in spirit”; but as each sentence is the masquerading habit of a thought which it would take a chapter to express, we must be excused a further commentary. In 1763, he contracted with his father’s maid-servant what is called a *Gewissensehe*, either because it is not of the kind to satisfy the most tender consciences, or because a more than ordinarily tender conscience is needed to ensure permanent respect for its validity. All Hamann’s biographers have been puzzled to reconcile this step with the not unmerited inscription on his tomb, *Viro Christiano*, and it will never now be decided whether he was influenced by an original theory of Christian liberty, or by supposed prudential considerations, for it was not thought fit to

publish the letters bearing on the subject in his collected works; and though Roth said, in the preface to them, in 1818, that provision had been made for their safe keeping, Gildemeister was told, forty years later, they had been destroyed. The informal union was happy enough, but in spite of the laxity of opinion and practice in Germany at the time there was some difficulty in finding godmothers for the three daughters who, with one son, completed the family, for the support of which Hamann was obliged to accept a situation as copying-clerk, his eccentricities and the Gallo-mania of his superiors debarring him from more important employment. Besides occasional reviews of books, he published, in 1772, *Kreuzzüge eines Philologen*, a collection of twelve essays, *à propos* of which he said: “The title of every book is a riddle, the answer to which tells, if not its contents, at least their value”: in other words, we are to regard the author as a Red Cross Knight tilting against most of the prevailing opinions in religion, science, and literature, in the name of the Word, the *λόγος*. It is difficult to give any idea of his manner of writing without quotation, and even more difficult to find a passage that shall be in any way intelligible out of its proper place in the author’s archipelago; for one way in which he acknowledges his own obscurity is by demanding “readers who can swim”—from one island of meaning to another, just as, when his handwriting was illegible, he put in the margin, “*Imaginez et sautez*.” The following is taken from the “Ninth Crusade,” headed, “*Aesthetica in Nuce*,” a rhapsody in cabalistic prose:—

“Salvation cometh from the Jews—I had not seen her yet; but I expected—to your shame, Christians!—sounder conceptions in their philosophic writings.—But you feel the sting of that worthy name by the which ye are called as little as the glory taken by God in the reproachful name of the Son of Man — — —

“Nature and Scripture therefore are the materials of the imitative; beautiful, creative Spirit — — Bacon compares matter to Penelope;—her impudent suitors are the worldly wise and those learned in the letter. You know the history of the beggar who appeared at the court of Ithaka; for has not Homer translated it into Greek, and Pope into English verse? —

“But wherewithal shall we awaken the expiring language of nature from the dead? — — By pilgrimages to Arabia Felix, by crusades to the Eastern lands, and by the restoration of their magic, which old woman’s cunning must make our prey, for no other is so good.—Cast down your eyes, idle bellies! and read what Bacon wisely says of magic.—If silken feet in dancing shoes will not bear you on so arduous a journey, let hyperbole show you the right way—*καὶ ἐπὶ καθ’ ὑπερβολὴν ὁδοὺ μὲν δείκνυμι*.”

He may well say, in the “Apostille”: “The rhapsodist has written with \* \* \* and — — —, obelisks and asterisks, like the little masters and pedants of his time”; but there were a few able and willing to read between the lines, and fill in the blanks, and even before the *Kreuzzüge* were collected, the Magus of the North, as Moser christened him, was recognised as a power. In 1775, Wieland’s *Mercur* spoke of him as the leader and representative of a party. He kept up a half friendly, half controversial correspondence with Mendelssohn and Nicolai. Lessing thought his writings a valuable test of the pretensions of the liberal gentlemen “who give themselves out for Polyhistor”; Herder, generally so arrogant, almost acknowledges himself as his pupil; Jacobi submitted to his sway; and many now forgotten notabilities—Kraus, Scheffner, and others—professed to owe all they were to his influence.

To estimate this influence, we must remember the divisions of the literary world of Germany at the time. The common sense, French, Voltairean rationalism, which had its stronghold at Berlin, had, unfortunately for itself, taken up arms against the rising national romantic literature heralded by *Werther* and *Goetz*. The national party was divided into those who, like Goethe, were “decidedly not Christian,”

and those who, like Herder, wished to convict the prevailing irreligion of shallowness. Standing almost outside these two tendencies were Lessing and Hamann, men of very unequal merit, but each "a voice crying in the wilderness" for thoroughness and light. As Lessing to the temporising, confused, rationalistic Evangelicalism of his theological adversaries, so Hamann to the dogmatic enlightenment of the uninspired hierophants of the *Literaturbriefe*. Of course, Lessing was pulling one way, and Hamann the other, and the seed sown by the former fell in most favourable ground; but they were alike in their disgust at whatever was neither cold nor hot, and alike too in suggesting proportionately more than they executed. If his contemporaries had been candid, they might have described Hamann's attraction, that, like Blake, he was "uncommonly good to steal from." Herder was accused of appropriating his *Metakritik* without acknowledgment; one admirer has found Hegelianism discovered in one phrase and rejected in the next in favour of a real Objective Trinity, and his writings came practically to possess more meaning than he intended, because, the sense of his really profound thoughts being made to a certain extent doubtful through their oracular expression, those who were attracted by the ideas suggested developed them each in their own direction, without ceasing to give Hamann credit for originating them. A very opportune tribute to the fascination of his strange compositions was paid, in 1784, by one Buchholz, a hypochondriacal man of fortune, who abruptly invited Hamann to regard him as a son, and accept a capital sufficient to provide for himself and the education of his children. But for this unexpected benefaction, Hamann's later years would have been sadly clouded by anxiety and hardship, and he would scarcely have accomplished what is almost his most considerable work, *Golgotha und Scheblimini*, under which astounding title he published an answer to Mendelssohn's *Jerusalem*. "The place of the skull, and Sit thou at my right hand," is certainly a riddle of a title, but the *opusculum* contains some very telling and lucid criticisms of the Social Contract and the State of Nature. There is a running ironical parallel between the true Moses and his namesake who attempts to make Jew and Christian blend in colourless Deism, though between them there is the Mount Golgotha, and one only is called to sit at the right hand of God; but for the major part of the moral application one must, as Goethe says, give up the hope to "what is commonly called understand."

Herr Petri's second part includes, besides the *Kreuzzüge* and some less important pamphlets, letters down to 1769. The last year of his life was spent in visiting his benefactor, Buchholz, the Princess Gallitzin, and Jacobi, from the latter of whom he fled lest he should be killed with kindness; the Princess's social circle was also too animated, and, we gather, too civilised to suit his age and infirmities; so, declining to fix himself at Münster, he was about to return home when a fever declared itself, and he died almost suddenly, in 1788, in the arms of Jacobi, at the house of his adopted son, and attended by the princess, who obtained permission to have his remains interred in her garden, a less secure resting-place, as it proved, than the common cemetery. Whether German Christians will be persuaded to renew their failing faith by diligent study of the Northern Magus seems more than doubtful; but it is well that all should know that there is such a man, and that his writings are an almost virgin mine of original mystical interpretations and startlingly acute criticisms—startling because acuteness is not commonly the chief distinction of those who wish to criticize Hamann's enemies. But a system, even a theological system (except Luther's cate-

chism), will be sought in vain, for men in general, he thought, lived on fragments, "crumbs," and he was not capable of supplying anything else. In his own phrase, he was shortsighted, he saw with strong and healthy eyes, but only what was close to him; unlike most men, he feels in the abstract and thinks in the concrete, and therefore all his thoughts express themselves in images or allegories. We have his own warrant, too, for thinking him obscure; after a few years he could no longer remember all that his own writings had meant when composed, and all that they had meant to him it was impossible for strangers ever to understand.

H. LAWRENNY.

### LITERARY NOTES.

It is reported that Mr. Whymp, who has returned with valuable collections from a second scientific tour in Greenland, has a work upon that Danish dependency in contemplation.

In the *Fortnightly Review* (November and December) Mr. Booth has devoted one of his clear and dispassionate studies of Socialism to Fourier and Fourierism; as an account of Fourier's doctrines it leaves nothing to be desired, but he is too fantastical a writer to show to advantage in a *précis*, without an independent appreciation of his merit, such as Mr. Booth might easily have given. In *The New Heloise*, part of a chapter in Mr. Morley's forthcoming work on Rousseau, the comparatively moral influence of the work is brought out, together with the fact, sometimes unduly neglected, that the conservative reactionary Romanticism of Chateaubriand and his school was derived directly from Rousseau: Hugo and De Musset caught the ball at its rebound.

In the November number of *Preussische Jahrbücher*, Herman Grimm discusses the claims of Minna Herzlieb and Bettina Brentano to be considered the original of Ottilie in the *Wahlverwandtschaften*. He inclines to give Minna the preference, but considers that Goethe's *Briefwechsel mit einem Kinde* scarcely deserves the neglect and distrust with which it is now fashionable to treat it: he had seen the originals of some of the letters, and though the printed versions are garbled, they have a good deal of "foundation in fact."

### Art.

#### THE CESNOLA COLLECTION OF CYPRIAN ANTIQUITIES.

THE Cesnola Collection of Cyprian Antiquities, which has been recently exhibited at 61, Great Russell Street, is now being packed for shipment to New York. Until these antiquities have been properly arranged in a museum, and the facts connected with their discovery duly stated in the publication now being prepared by General Cesnola, and until they have been compared with what has been already acquired from Cyprus in other museums, it is perhaps premature to advance any very positive theory as to the sources of Cyprian art and the date of its development. It may, however, be well to note here some of the problems which present themselves to the archaeologist after a survey of the Cesnola Collection.

1. A certain number of the larger statues found at Golgos by General Cesnola, and by Mr. Lang at Dali, seem modelled from Egyptian types; while some of the details of costume and of the necessary symbols are clearly derived from a non-Egyptian source (see the torso engraved in Gerhard's *Denkmäler u. Forschungen*, 1863, pl. clxxi.; and Stark's memoir, *ibid.*). These figures seem to be all portraits of kings. Are these Egyptian kings, dedicated during the time when the island was subject to Amasis, or are any of them memorials of that earlier subjection of Cyprus (the Kefa of hieroglyphic texts) which, as may be inferred from Egyptian monuments, had taken place as early as the reign of Thothmes III., or even earlier?

2. Are these statues, again, portraits of Cyprian kings executed when the island was under Egyptian influence, as Stark suggests in the excellent memoir already referred to?

3. On a series of silver coins struck in Cyprus, of which the date probably ranges between B.C. 500 and 400, we find Cyprian characters, and inscriptions in the same character have been found by General Cesnola at Golgos, by Mr. Lang and others at Dali. This character has been recently read by Mr. George Smith, of the British Museum, who used the bilingual (Cyprian and Phoenician) inscription, found by Mr. Lang at Dali, as his key (see *Trans. of the Soc. for Biblical Archaeology*, No. 1, p. 129). We find in these Cyprian inscriptions certain letters which present a striking resemblance to some of the Lycian characters, but we do not recognise, as in the Lycian alphabet, Greek letters in their mature forms. It is probable that a large proportion of the Cyprian inscriptions are of a date subsequent to the Archaic period. The earliest of them may be the inscription on the stelé with a figure in relief of an archer found by Mr. Lang at Dali, and now in the British Museum, and the bilingual inscription from Cyprus, now in the Louvre, in which KAPYI EMI, in Archaic Greek characters, is the equivalent of the Cyprian (see *Revue archéol.* N. S. vi. p. 247). Some of the Cyprian inscriptions in the Cesnola Collection may be as late as the third century A.D. It is remarkable that as yet hardly a Greek inscription has been found in Cyprus, either on coins or on other monuments, which can be referred to an earlier date than the time of Evagoras; and this negative evidence affords reasonable presumption that the Cyprian population predominated in numbers, if not in political power, over the Greek in most parts of the island. Whence did the race using the Cyprian alphabet come? Are they Phrygians as Engel supposed? Did they intermarry and become politically blended with the Greek and Phoenician settlers? Or were some of the small kingdoms into which Cyprus was divided from a very early time purely Greek, and others Cyprian and Phoenician?

4. In all the sculptures from Cyprus which can be fairly referred to the archaic period, and which are not close imitations of the Egyptian, the type of features is very peculiar. The forehead recedes; the cheek-bones are high; the cheeks, sunken; the nose, chin, and lips, unnaturally pointed; the facial angle, much sharper than in early art. It is singular that we must look to Etruria rather than to the Greek world for types analogous to the Cyprian. The two curious reclining figures in painted terracotta from Cervetri, in the Campana Collection of the Louvre, have the same receding foreheads and angular features as may be seen by comparing the engraving of the figures in the *Monum. of the Roman Inst.* vi. pl. 59 (see Brunn, *Annali*, xxxiii. pp. 398, 399), with the figure and head from the Cesnola Collection (*Revue archéol.* N. S. xxii. pl. 23).

5. From the history of Cyprian sculpture as developed in extant monuments, we may infer that art in this island passed through the same phases as in Etruria. First came an Archaic style, with a certain affinity to the Archaic Greek style, but differing from it very decidedly in the type and in many details of costume and ornament. Then succeeded a Hieratic style, through which archaic types were mechanically reproduced, and after that the disturbing influence of mature Greek art. It is probable that it was part of the Hellenizing policy of Evagoras to invite Greek artists to Cyprus, just as the Carian princes, ruling over a mixobarbaric population, drew Athenian art to Halicarnassus. But it should be noted that neither in Cyprus nor in Etruria does this Greek art, introduced at a late period from without, appear to have flourished except as an exotic. It gave rise to no school of Greek artists in Cyprus.

6. As there were undoubtedly Phoenician settlements in Cyprus, and as Phoenician inscriptions both on coins and other monuments are found there, it is to be presumed that some of the works of art found in the island are Phoenician. How are we to distinguish these works from the rest? What are the characteristics of Phoenician art? Or had they, as some assert, no art of their own, being merely the carriers by sea of the produce of other races? No complete answer to this question can be given till we have compared the antiquities from Cyprus presumed to be Phoenician with those found in other Phoenician or Graeco-Phoenician sites, such as Rhodes, Santorin, Cerigo, Sardinia, Palermo, the Etruscan sea-board,

and the Phoenician settlements on the coast of Spain. In the meantime we may draw attention to the admirable memoir, by M. A. de Longpérier, in the *Journal asiatique* of 1858, in which he was the first to point out the remarkable resemblance between the art of the silver bowls from Kitium in the Louvre and those found in a tomb at Cervetri, and with the bronze bowls found by Mr. Layard at Nineveh, some of which have Phoenician inscriptions. The bronze bowl found by General Cesnola, which is published by Ceccaldi in the September number of the *Revue archéol.* for this year, is much ruder in work than the Kitium bowls, and may be a Cyprian imitation of Phoenician art. There is a well known kind of fictile ware, with geometrical patterns painted in brown on a drab ground, which is found at Mycenae, Tiryns, Ialysus, and other very ancient Greek or Graeco-Phoenician sites. It seems now clearly established that the Phoenicians traded in this ware, if they did not manufacture it, because on more than one fragment from Mr. Layard's excavations, and on a large vase in the Cesnola Collection, we find Phoenician inscriptions. The tombs at Cyprus have yielded this ware in large quantities, and in very fine preservation: while, on the other hand, scarcely any of the later Greek fictile ware has been found in the island. It is not improbable that this archaic fabric of ware was prolonged in Cyprus to a comparatively late period, from the same causes which led to the prevalence of a Hieratic style of sculpture, and it would be interesting with this view to compare the specimens of this ware from Cyprus, in the first Vase Room of the British Museum, with the similar vases from Ialysus presented by Professor Ruskin to the same museum.

7. Among the terracottas found in Cyprus are some very curious little figures, some on horseback, some driving four-horse chariots. These are modelled solid, and sometimes painted in grotesque colours. They are of the rudest art and fabric. Similar figures of horsemen were found by me in a sepulchral chamber on the site of the Mausoleum, which I have shown to be of a much earlier period than the Mausoleum itself. From the extreme rudeness of these terracottas, it has been thought that they represent an earlier stage of art than any of the other Cyprian antiquities; but may they not be rather children's toys, or objects dedicated by very poor persons?

8. Among the Cesnola statues may be distinctly recognised two varieties of the type of the bearded Venus, Hermaphroditos, worshipped at Amathus (see Engel, *Kypros*, ii. pp. 221-232). I hope to say more respecting these types on a future occasion.

C. T. NEWTON.

## ART NOTES.

A letter signed J. Spencer Northcote appeared in the *Times* of November 26, in which attention was called to a danger of a serious nature now threatening the safety of the Catacombs. Up to the present time the right of making excavations in them has been reserved to the ecclesiastical authorities, and for many years has been exercised by a Commission of Sacred Archaeology, of which the Cavaliere di Rossi was a leading member. If in the course of excavations damage was done to the superficial soil, it was assessed and paid for; where the commission found that their labours were likely to be extensive and prolonged, they would induce the Pope to purchase the fee simple of the soil. In this way he became the possessor of the two vineyards between the Via Appia and the Via Ardestina, under which the famous Catacomb of St. Callixtus has been rediscovered. Recently, a discovery, scarcely inferior in importance, has been made in a field the other side of the Via Appia, of the Catacomb of Pretextatus, and considerable progress had been made, when proceedings were suddenly interrupted by the proprietor bringing an action against the excavators. Di Rossi was the defendant, and a decision favourable to the archaeologists has been given in two courts of law. But the decision only proclaims that the commission and not the landlord are in possession of the crypt, but does not decide the question as to the legitimacy of this possession. The Italian code has been promulgated in Rome. The ministry are, indeed, preparing a project of a law by which questions of this kind are to be settled, defining accurately all

rights relative to monuments standing on private property. But it is to be hoped that special attention will be bestowed on this matter of the Catacombs, and that their public character will be clearly pronounced, so that all that has been done may be preserved to us, and the accomplishment of all that remains to be done facilitated.

We learn from the *Cologne Gazette* that the National German Museum at Nuremberg has recently made considerable acquisitions of importance to artists, and to those who are interested in the origin of printing. These acquisitions consist of a series of engravings on metal and wood, commencing with the fourteenth century, and carried down to the last years of the fifteenth. At this point, the chain is taken up by the collections already in the possession of the museum, consisting of the works of Wohlgemuth, his pupils, contemporaries, and successors down to the seventeenth century. A second series is wholly devoted to printing, and contains first examples of xylography, and these specimens of the first books printed in movable type by Gutenberg, Pfister, Fust, and Schöffer. Next come the books of the most celebrated printers of the fifteenth century. The collection is especially rich in works illustrated by wood engravings, of which it possesses many that are extremely rare, and some which are supposed to be unique. Engravings in mezzotint, &c. form the third series; and the fourth, which has been long in existence, is dedicated to the history of engraving on copper. The collection of MSS. has also been recently enriched by the purchase of a fragment of a Bible of the commencement of the sixth century, in twenty-four leaves, which forms the first of a series consecrated to the history of writing.

The restoration of the cathedral at Mainz is carried on actively. The works at the east end have already progressed so far that the architect Wessicken is about to set free the space occupied by the ruined and destroyed crypt, portions of which have been discovered from time to time. The excavations afford matter of great interest both to architects and archaeologists. The broken remains of tombs and monuments which are brought to light often show claims to considerable importance as works of art, and it is expected that much light will be thrown on certain architectural questions concerning the construction of the cathedral which are at present doubtful.

The present number of *Im Neuen Reich* contains an appeal to the flagging interest felt by the public of Germany in the proposed National Monument to be erected on one of the hills of the Niederwald. The writer objects to the site chosen, and points out that it takes the excitement of battle to induce Germans to clamber up inaccessible hills, and, again, one of the first necessities of a place which it is proposed to make a point of universal pilgrimage is a *Restauration*; this has not been properly provided for in the plan. We then pass from these practical hints to suggestions of an aesthetic nature, the principal of which is that the road of approach should be lined on both sides with the statues of the most distinguished German emperors, the eye and thoughts being thus led gradually up to the final crowning monument.

☞ The *Gazette des Beaux-Arts* for December 1 commences with an article, by M. Paul Mantz, on the Retrospective Exhibition at Milan. M. Mantz draws special attention to the masterly and concentrated force exhibited by Bernardino Zenale in two portraits contributed to the exhibition by the Marquis Giuseppe Arconati. Zenale, who was a contemporary of Leonardo, is chiefly known by his admirable painting, in the Brera, of Lodovico Sforza (Il Moro) and his wife, Beatrice, kneeling before the Madonna. The Marquis Pietro Isimbardi contributed a very remarkable female portrait, by Beltraffio. Luini was well represented, but there were also a great many poor imitations passing under his name. The Prinetti collection contributed a fine and authentic Lorenzo di Credi, a Virgin by Gaudenzio Ferrari, which was a very typical example of the master, and a very important Paris Bordone. Amongst the most striking sixteenth-century portraits, M. Mantz places a Moroni, from the gallery of the Marquis

Arconati. One of the most curious features of the exhibition was, says M. Mantz, the number and beauty of works representing the Dutch and Flemish schools.—M. Georges Duplessis reviews M. Didot's *L'Étude sur Jean Cousin*, a portion of which has already appeared in the pages of the *Gazette*.—M. Louis Decamps continues his articles on the New York Museum.—M. Louis Gonze gives a third notice of the Musée de Lille.—M. Alfred Michiels commences an essay on the origin of painting in Germany by a short article on the school of Bohemia.—M. René Ménard has a short paper on Subterranean Rome.—M. Léon Mancino writes on Bethnal Green Branch Museum.—M. Louis Desprez reviews *La Vie militaire et religieuse au moyen-âge*, &c., by M. Paul Lacroix.

On the 4th, 5th, 6th, and 7th of December, the collection of M. F. L., well known to Parisian amateurs, was brought to the hammer, at the Hôtel Drouot, by M. Charles Pillet. The catalogue comprised sculptures in wood and ivory, bronzes, a very remarkable snuff-box, by Lioux de Savignac, presented to Louis XV. by the town of Bordeaux, precious stones, miniatures by van Blarenberghe, paintings by Boilly, Breugnel, Paul Brill, Corneille de Heem, Louterbourg, Michel, Ostade, van de Velde, Wynants, de Vos, Gevricault, &c.

Richard Schöne, till now in Halle as professor, has accepted the office of "vortragender Rath im Cultus-Ministerium (für Kunst)." He is a capable man, and his appointment is an excellent one. Zahn (Hofrath), who holds the same position at Dresden, refused the post, which was given to Schöne.

### Theology.

The Song of Solomon. [*Schir haschirim*, oder das salomonische Hohelied übersetzt und kritisch erläutert von Dr. H. Graetz.] Wien: Braumüller.

THE character and date of the Song of Solomon has been a vexed question among commentators. There are champions of its unity as well as of its fragmentary character; some scholars call it a dramatic work, others a lyrical composition consisting of different songs; some assert Solomon as its author, whilst others suppose it to have been written in the time of the Jewish restoration, and Dr. Graetz even in the days of the Seleucidae. Under these circumstances it was a somewhat bold assertion of a modern critic to say that the latest enquiries had placed the dramatic form of this book above all doubt. On the contrary, the two last writers on this subject, Dr. Graetz and Dr. Diestel (in Schenkel's *Bibellexicon*), deny it entirely, and I think justly. For if it were really a dramatic composition, with a clear distinction between the actors, there would not be so many entirely different opinions as to its argument, that not even the number of the principal actors has been fixed to the

satisfaction of all. Some introduce, besides Solomon and the so-called Sulamith, a third person, the betrothed of Sulamith, but Delitzsch admits only the first two actors, not to speak of the action itself, which is almost entirely a fiction of the commentators, not at all resulting from the text.

Then as to the acts. Ewald is of opinion there are five; Delitzsch, six; E. Meier, seven; Hitzig, nine! The first and the last of these so-called acts, which are identical in all these arrangements, consist of twenty-six and fifteen lines of the printed text! How, in any dramatic representation, can fifteen lines be sufficient to form an act? If some tragedy of Aeschylus, Sophocles, Shakespeare, Goethe, had been handed down to us without a list of the actors and the distinction of the different speeches, it could, I dare say, be so far rearranged that no reasonable doubt should remain about the main argument and development of the action. But with regard to the Song of Solomon we have *quot capita tot sensus*, a fact from which I conclude that it is no dramatic work at all. The sober criticism of men like De Wette, Bleek, Magnus, therefore, never accepted the idea of the Song of Solomon being a drama, which has not even the merit of being original, for Philander von der Linde (F. B. Menke) already in 1710 declared that it was the first opera—not to mention the statement of Origen, that it was composed in the manner of a drama.

Those who, like the present writer, have been discontented with the arbitrary manner in which the Song of Solomon has been treated will read some parts of the book of Dr. Graetz with satisfaction and even with pleasure. He shows clearly that this so-called drama is devoid of action, and that all attempts to elicit anything like a plot are in vain, and it must be owned that none of our Western or classical designations for the different kinds of poetry can be strictly applied to the Song. But when he tries to show, throughout the whole book, a single maiden relating her adventures to a company of other women (the daughters of Jerusalem), Dr. Graetz seems to be no nearer the truth than his predecessors. He thinks that the poet declares his intention of giving both dialogues and a narrative, by adding ענה ירדני ואמר לי, ii. 10; but this only proves that the following words are related as those of another person. Besides, Dr. Graetz cannot deny that (v. 9) the supposed hearers speak themselves, so that the daughters of Jerusalem cannot be the auditory, but spoken of in the recital. This one passage gives the deathblow to the whole theory. The Song is neither a drama nor an epic poem recited to the daughters of Jerusalem, and the often repeated words, "I charge you, O daughters of Jerusalem, not awake love, until it cometh of itself," are certainly no warning against this passion, but have some other sense.

This leads us to the question of the general tendency of the book. Those who defend its unity, whether dramatic or epic (we may omit the allegorizers), generally look for some religious or moral idea, such as monogamy, or faithfulness in love, or the representation of a marriage founded on true love—but, alas! the lovers in the Song of Solomon do not marry each other, and faithfulness is not mentioned in the whole book; it is a mere illusion to find such things in our poem. Dr. Graetz also takes pains to prove that there is a moral idea, and so he points out a number of passages in which he thinks it to be evident.

Thus in vi. 8, 9, he sees a commendation of true and chaste love in opposition to the voluptuous pleasures of the harem—the poet praising his *only* and *pure* love. It may be answered that it is almost a general and necessary law in erotic poetry of the higher kind that a lover has but one mistress, whom he praises as faithful and chaste. To

suppose the contrary is impossible, passionate love being "strong as death," and—

"Love-devouring Death do what he dare,  
It is enough I may but call her mine."  
(*Romeo and Juliet*.)

It is scarcely permissible to draw such precise conclusions from such a natural expression. The passage in question (vi. 4-10) may be fitly explained thus:—"Thou art of surpassing beauty; and though there are many ladies of high rank, I prefer thee to them all: thou alone art my dove," &c. In chap. v. 1, Dr. Graetz thinks that frugal simplicity is contrasted with the luxurious banquets given by the *jeunesse dorée* of that time. But according to his own interpretation, the words *אכלתי יערי עם רבשי שתיתי ייני עם חלבי* have a metaphorical sense: "to eat his honey" means to hear her sweet song; "to drink his wine" is to enjoy her love (p. 167). How is one opinion (p. 32) to be reconciled with the other? The meaning of the passage is pretty clear: "My love is a paradise full of sweet fruit . . . a garden with a well of living water (iv. 15); I entered that garden and ate its fruit." There is not so much as an allusion to luxury and temperance.

This same idea is expressed, according to Dr. Graetz, in the words *נרדני במסבני נרדני נתן ריחו*; here נרדני is supposed to be her lover, who shows his gallantry ("his perfume") whilst the king is sitting at a banquet. The meaning is said to be that she and her lover enjoy their happiness in simple modesty, and have the dislike of Horace to *persicos adparatus*. But this too is inadmissible; the only natural meaning of נרדני, "my nard," is *her* loveliness.

Granting that viii. 11, 12, contains the idea that the maiden does not want a guardian of her virtue, or even that virtue defends itself, as almost all modern commentators explain the passage—though the sense of the 200 shekels remains doubtful—a hint like this is not sufficient to prove a moral tendency throughout the whole poem. Finally, in vii. 1, Dr. Graetz discovers a polemic against the public dancers; and in the words, *איש חרבו על ירכו מפחד בלילות* (7-11), he finds the idea that true love makes a man valiant and strong, but profligate love effeminate and timid.

From these instances he concludes that the Song of Solomon is written in opposition to sensual love, public dancers and singers, and life in towns and at the court with its luxurious and effeminate customs. Such a tendency could only exist at a particular period, which has now to be ascertained.

It is impossible to follow Dr. Graetz in a system of exegesis which turns the simplest expressions of an erotic song into covert moral exhortations. On the other hand, his remarks on the date of the language, and consequently of the poem itself, are well worth reading. Modern commentators are averse to dwell on the importance of phrases like *נָחַל* = *שלמה*, *ממנו של שלמה*, כרמי של, which indicate a very late period. Wishing to make the poem as ancient as possible, they neglect those passages which are adverse to this opinion, e.g. words not used in the older Hebrew literature, as *פֶּתַח*, "wall" (anc. *קיר*), *מִדְרָגָה*, "terrace" (anc. *מעלה*), *סִתּוֹ*, "curls" (anc. *קוצות*, *חרף*), *חֶרֶף*, "winter" (anc. *שְׁתָּאִי*), *סִתּוֹ*, "winter" (anc. *שְׁתָּאִי*), *סִתּוֹ*, "winter" (anc. *שְׁתָּאִי*).

(*סִתּוֹ*), *סִתּוֹ*, "artist" (anc. *אָמֵן*, *דִּמְעָה*, "tondere," *סִתּוֹ*, rad. *סִתּוֹ*), *סִתּוֹ*, "to keep" (anc. *נָצַר*, *הִצִּיץ*, "to look," though the words enumerated by Graetz may not be all decisive. Besides these comparatively modern words, the Song also contains foreign words: e.g. *פֶּרֶס*, *אֶרְמֵן*, and vii. 6, *כֶּרְמֶל*, which, like *כֶּרְמֶל*, certainly means "cochineal," red hair being a mark

of beauty in the East. The use of these Persian words favours the view that the poem arose subsequently to 500 B.C. But this is very little compared with the use of a Greek word, *φωρεῖον*, *פֶּרֶיִן*, which it is ridiculous to derive from *פֶּרֶה*, "quoniam super eo foecundi sint et multiplicentur." The etymologies proposed by Ewald and Hitzig are rejected by such a learned Hebraist as Delitzsch. The words *פֶּרֶה* and *פֶּרֶיִן* are supposed by Graetz to be also of Greek origin; but I question the justice of this opinion, as well in this as in two other passages of the Song—iv. 1, where he proposes to read *וְרָדִים עִם וְרָדִים*, instead of *וְרָדִים*, so that *וְרָד* would be *וְרָדִים*, *וְרָדִים*; and iv. 4, where he explains *תְּלַפְיוֹת*, a really difficult word, by the Greek *τηλεῖται*. Both these conjectures are ingenious, but of no value as evidence.

It may be sufficient to add that Dr. Graetz also points out some direct allusions to Greek customs, e.g. the crown of the bridegroom (iii. 11), and the pillars of marble (v. 15). He is mistaken in adding to these the use of apples as a symbol of love or fertility; the modern Nestorians also use them at their nuptials (see my *Neusyrisches Lesebuch*, p. 19). In conclusion he gives an elaborate comparison between Greek writers of idylls and the author of the Song of Solomon. Those who maintain the antiquity of the latter will do well to attempt a satisfactory refutation of the evidence brought forward by Dr. Graetz; though I fear it will prove easier to deny than to refute. On the other hand, Dr. Graetz himself is in a similar position, for he omits the passage about Thirza (vi. 4) which furnished the defenders of a high antiquity with their principal argument; only his evidence is more copious than that of his opponents.

The result of his combinations is that the poem was written B.C. 230–218, as a warning and example to the Jewish gentlemen of Jerusalem and Alexandria. I have nothing to say against this date, but much against the tendency, since I fail to see how a poem containing passages like ii. 6 can inculcate a better lesson than certain modern novels. It is more likely that the poem consists of different songs, solo, duo, descriptive, telling of possibly far distant ages, and subjected in the course of time to numerous alterations. These songs were then collected in the decline of Hebrew literature, as we gather from some linguistic indications referred to above. Some of them may also have been composed at a late period; the common objection that erotic poetry ceases to be written in times of political decay being refuted by comparison of other literatures.

After the introduction, Dr. Graetz gives a reprint of the Hebrew text, and a translation with a commentary. It is a pity that he did not insert his corrections in the text, a reprint of the Masoretic text being useless, as it is in everybody's hands. The corrections themselves have different degrees of merit; some of them are very probable, e.g. i. 3, *תְּמָרוֹת* (for *תְּמָרִים*); i. 7, *אֵיפָה* (for *אֵיכָה*), &c. But I cannot enter here into further details. The chief importance of the book lies in its vigorous opposition to the prevalent dramatic hypothesis, which renders the true understanding of the text quite impossible.

For this and for other reasons it is an acceptable and even necessary addition to our critical literature, though scarcely any one will accept the main conclusion of the author.

ADALBERT MERX.

**Observations on the Collation in Greek of Cureton's Syriac Fragments of the Gospels with Schaaf's Edition of the Peshito and the Greek Text of Scholz.** By J. R. Crowfoot, B.D. Williams and Norgate.

MR. CROWFOOT has now completed his laborious collation of Cureton's *Syriac Fragments of the Gospels* with the

Peshito Syriac and the Greek text of Scholz. In a former number of the *Academy* (vol. ii. p. 63) we pointed out that Mr. Crowfoot's Greek text could not be accepted as a reproduction of the Gospels in their original form. We find, however, from the *Observations* now published, that this was not the object which Mr. Crowfoot proposed to himself, but rather to fix the character and prove the critical importance of the Fragments themselves. In this respect we think that his work is very valuable. Undoubtedly the discovery made by Dr. Cureton of the remains of an old translation of the Gospels in a manuscript, itself of the early date of the latter half of the fifth century, is the most remarkable fact connected with New Testament criticism in recent times; and as there is a striking agreement between the text of these fragments and that of the Cambridge Codex Bezae, the most unlike of all texts to that generally received, the discovery was very unpalatable to those scholars who by the laborious collation of the general run of MSS. had arrived, or supposed that they had arrived, at a text substantially settled. Naturally, therefore, a warm controversy arose; for if the Curetonian Fragments are of the high antiquity claimed for them, scholars must either accept them, and with them the objectionable Codex D, as of paramount authority, or must give adequate reasons for disregarding the text which they offer to us.

As Mr. Crowfoot points out, the antiquity of the Curetonian Fragments has been satisfactorily proved, independently of his labours, while his work was going on. The publication of the Homilies of Aphraates by the most eminent of our Syriac scholars, Professor Wright, of Cambridge, has placed in our possession evidence of the most important kind. We know for certain that ten of these Homilies were written in A.D. 337, twelve more in A.D. 344, and the last in A.D. 345; and their value is increased by the fact that they are not a translation, but were originally written in Syriac by the author. In this work, then, more ancient than any manuscript now extant, the quotations are made, partly from the same text as that contained in the Curetonian Fragments, and partly from the Peshito. The manner of the quotation is such as to incline us to receive Mr. Crowfoot's opinion as the correct one, namely, that the Peshito version was then coming into use, and superseding the Curetonian; just as subsequently the Harkleian superseded the Peshito.

We still however retain our opinion that the Curetonian must be used with great discretion. As might be expected in so ancient a work, the translation is loose and inaccurate, and betrays very frequently considerable ignorance of Greek. Deservedly the Peshito took its place, just as Jerome's version drove the old version out of the field, and our Authorised Version that of Coverdale. But the main point is, not the relative value of the translation, but of the texts from which they were made.

A competent scholar who would publish a Greek Testament, with the variants really contained in the numerous Syriac versions, and in works like that of Aphraates, would be doing good service to textual criticism. At present the references to the Syriac are often untrustworthy. Mr. Crowfoot has performed a valuable service in another direction, namely, in establishing the claims of the Curetonian Syriac, as containing a text of the highest antiquity.

R. PAYNE SMITH.

**Commentaries on Genesis.** [Wieland Dr. Fr. Tuch's *Commentar über die Genesis*. 2. Auflage, besorgt von Professor Dr. A. Arnold, nebst einem Nachwort von K. Merx.] Halle: 1871. [*Commentar über die Genesis*. Von Franz Delitzsch. 4. gänzlich umgearbeitete Ausgabe.] Leipzig: 1872.

It is a remarkable testimony to the value of Tuch's *Commentary on Genesis* that there should still be a demand for

it, thirty-three years after its first publication. It is impossible, indeed, to suppress a regret that the author was prevented from rewriting his work in accordance with maturer critical views and more recent Oriental researches. But the task which the author had neglected could not be performed by a strange hand. Dr. Arnold, therefore, wisely confined himself to incorporating the author's manuscript notes, which consist chiefly of illustrations from Oriental literature, and inserting a few indispensable corrections, and some references of his own to the works of contemporary scholars. He has also added Tuch's essay on Genesis xiv. from vol. i. of the *Zeitschrift* of the German Oriental Society. Owing to his untimely death, the latter part of the printing had to be superintended by Dr. Merx, to whom the reader is indebted for one of the most valuable features of the new edition. This is a *Nachwort*, or "after-word," appended to the original introduction, and containing a historical survey of the criticism of the Pentateuch since the date of Tuch's first edition. Without aspiring to the completeness of the literary summary given by Dr. Delitzsch, it is far more striking and suggestive, owing, doubtless, to the superior consistency of Dr. Merx's position. It is also distinguished for moderation. The writer evidently inclines to the hypothesis of Graf, so far as the late origin of the ritual legislation is concerned, but he is not blind to the weakness of that hypothesis on the side of literary analysis. One of the most interesting parts of the essay is the comparison of Ewald's critical terminology with that of other writers, from which Dr. Merx concludes that the literary critics of the Pentateuch are in all essential points practically agreed. Further progress is expected from a more complete analysis of the Levitical legislation.

The second of the above-named commentaries has been much more thoroughly revised. It may now be said to be, on the whole, the best handbook to the bibliography, the history and mythology, the geography and archaeology, required for the study of Genesis. The title-page mentions contributions from Professor Fleischer and Consul Wetzstein. The former (see pp. 52, 57, 532, 551) have, I believe, mostly appeared in the third edition; the latter are new, and were described in the *Academy*, vol. iii. p. 350. The author's own philological notes are also highly suggestive, and great credit is due to the compiler of the excellent indices. An even greater merit, on account of its rarity, is the frank sincerity of the author, who admits that the criticism of the Pentateuch should be conducted on purely literary principles, and that the unitarian hypothesis is no longer tenable. It is unfortunate that such admirable qualities should be marred by a passion for theosophy, which treats the supernatural details of the unhistoric narratives of Genesis as so many revelations of the invisible world.

T. K. CHEYNE.

### Intelligence.

Bishop Colenso continues his criticism on the *New Bible Commentary* (Longmans). Not having thought it worth while, however, to give a detailed review of that work, we can only afford a brief and meagre notice of this very skilful but very severe examination. (Cf. our first notice, *Academy*, vol. ii. p. 535.) In part ii. the author dissects (no other word is suitable) the introduction to Exodus by Canon Cook, and the commentary on that book by the Canon himself and the Rev. S. Clark, a process which is applied in part iii. to Mr. Clark's work on the Book of Leviticus. The results are but a shade less unfavourable to the commentators than before. No scholar can deny their substantial accuracy in many points, though, with regard to the matter of fallacious and evasive reasoning, more allowance should perhaps have been made for the difficult position of benefited clergymen under archiepiscopal supervision. As we anticipated in our former notice, the writers have been shown to have a defective acquaintance with the criticism of the opposite side. A still more serious charge

proved against Canon Cook is that of inaccuracy in stating the facts as to the *usus loquendi*, since upon these depends one of the most important arguments in the Pentateuch controversy. The Bishop admits, however, that Mr. Clark's contributions are more moderate in tone, and, at least in Exodus, less biased by prejudice than those of his fellow-contributor. It is only fair to say that the ability displayed here, and in the sixth part of his work on the Pentateuch, is such as to place Bishop Colenso in the first rank of living critics, though the *Examination* would perhaps have been more effective had the author been rather more sparing of his hypotheses.

The object of the contributors to the *Protestanten-Bibel Neuen Testaments* is to condense the most probable results of a rational (not rationalistic) criticism in a form adapted to the ordinary language. Its title to mention in these pages consists in the fact that the list of contributors contains several of the most respected names among contemporary scholars, e.g. Holtzmann (on the Synoptic Gospels, Ephesians, Colossians, and Philemon), Lipsius (introduction to the Pauline Epistles and commentary on Romans), Hilgenfeld (on 1 and 2 Peter, Hebrews, and Jude), Holsten (on Galatians). The translation is that of Luther; a few corrections are inserted between the text and the notes. It was a happy idea to divide the editorship between a clergyman and a layman; the pithy words of the latter (Dr. v. Holtzendorff) in the preface express truths which are still far from commonplace. See especially his remarks on the only true sense in which the New Testament can be said to contain contradictions (p. viii). The style of the notes, which are, if anything, too few rather than too many, is not exactly elegant, but free from rhetoric and pedantry.

The second volume of Hausrath's *Neutestamentliche Zeitgeschichte* carries the narrative from the foundation of the Christian Church to the second sojourn of St. Paul in Corinth. The third volume of this great work is still to come. It may be as well to remind the reader that the object of the author is to trace the connection of Christianity with the course of the world's history on the basis of a critical examination of the records, the results of which are to be taken as proved. Even on the literary side, the work compares not unfavourably with *Les Origines du Christianisme* of M. Renan. The only important defect we have seen noticed is the want of a first-hand knowledge of later Hebrew literature. The author has just brought out a second enlarged edition of his popular work, *Der Apostel Paulus*.

Dr. H. Strack, of Leipzig, has completed his *Prolegomena* to the Old Testament, the first part of which we announced some time ago. It is a full and accurate summary of all that is as yet known respecting the lost as well as the extant MSS. of the Hebrew Bible, and may be heartily recommended as a supplement and corrective to the current introductions to the Old Testament. (Cf. the review in Geiger's *Zeitschrift*, 1872, p. 140.)

A monograph by Dr. Clem. Brockhaus (*Aurelius Prudentius Clemens in seiner Bedeutung für die Kirche seiner Zeit*) treats of the archaeological illustrations to be derived from the poems of Prudentius, which coincide remarkably with the pictorial representations in the Roman catacombs.

No scholar who busies himself with the history of ancient religions can afford to ignore Mr. C. P. Tiele's *Comparative History of the Egyptian and Mesopotamian Religions*. The author, who writes in Dutch, is acquainted with recent researches, and has a sober, critical judgment. The portion on Phœnician and Canaan may be specially recommended.

The *Bibliotheca Sacra* for October announces a volume of *Emendations of the Authorised Version of the Old Testament*, by Elias Riggs, translator of Winer's Chaldee Grammar, and now missionary at Constantinople.

### Contents of the Journals.

The *Revue Archéologique* for November contains a paper by M. V. Guérin on the situation of the tomb of the Maccabees. He agrees with M. Sandreczki (who seems to have been anticipated by Father Forner) in identifying Modin with the village el-Medieh, but differs from that gentleman in placing the sepulchres not at Khirbet-el-Yehoud but at Khirbet-el-Gherbaoui (M. Guérin's spelling). Both ruins are in the neighbourhood of el-Medieh, but only at the latter are there unmistakable traces of a monument such as that described in 1 Macc. xiii. 27-29.

*Studien und Kritiken*, 1873, No. 1.—The visible and the invisible Church (Gottschick).—The myths of Jesus in Judaism; by Rösch. [Attempt to account for the historical origin of these traditions].—On some New Testament sayings of cognate meaning:—Acts xvii. 31; x. 35; Romans xv. 16; i. 18-32; ii. 14-16; by Michelsen. [(a) Connects *ἐν ἀνδρὶ* with *πίστιν παρασχόν* πᾶσι. (b) "Men of all nations shall become members of the spiritual Israel." (c) *λειτουργὸς* = preacher of the Gospel; *τῶν ἐθνῶν*, a genitive of the subject; *γίνηται* = be performed.]—The evidence for the birth-year of Luther;

by Köstlin. [Uncertain whether 1483 or 1484].—On Hutten's work, *de Schismate extinguendo*; by Lindner. [The work consists of six letters, five from the universities of Oxford, Prague, and Paris, the sixth from the Kaiser Wenzel, and all relating to the great papal schism. Lindner thinks, however, that they are all by the same, and that an English, hand; their object being to establish the doctrines of Wycliffe on the Papacy. He traces them to Oxford.]—Kleinert on Deuteronomy; rev. by Riehm. [An able and suggestive but unsuccessful work.]—Works on practical and apologetic theology.

*Monatsschrift für Gesch. u. Wiss. des Judenthums*, October.—Gibea and Geba, Gibeat-Saul and Gibeat-Benjamin; by Dr. Grätz. [Distinguishes three places called Geba or Gibeah: (a) the residence of Saul, near Ramah; (b) the town of Geba, west of Michmash; (c) the village of Gibeah, near Jerusalem, where Titus encamped.]—Studies on the LXX. and Peshito to Jeremiah; by P. F. Frankl. [Tends to show that several translators were concerned in the LXX. version.]—The Targum on the Psalms (conclusion); by W. Bacher. [Ascribes it to the same writer as the Targum on Job; fixes the date before 476, because of allusion to the two capitals, Rome and Constantinople.]—November.—The doxologies in the Psalms; by Dr. Grätz. [The doxology is thought to have been, properly, not merely the conclusion of each of the four books of the Psalter, but to have belonged to every psalm when used liturgically. This doxology consists of two parts: 1. The formula, בְּרִיךְ ה' אֱלֹהֵינוּ, preceded by אֱמִתּוֹ, which is an exhortation to the people to take part in praising God; 2. The response of the people, viz. the single or double Amen, and sometimes Hallelujah.]—Studies, by P. F. Frankl (continued).—Halacha-criticism, by Zuckerman.

*Theologisch Tijdschrift*, November.—The Church of Scotland; by L. W. E. Rauwerhoff. [A summary of the lectures of Drs. Stanley and Rainy, followed by a singularly fair criticism of their respective positions, which we could wish to see translated into English.]—The Epistle to the Galatians in Tischendorf's eighth edition; by J. J. Prins. [The result is that Tischendorf has really improved the text, under the influence of *Cod. Sin.*, in six more or less important passages (i. 10; iii. 1; iv. 14, 15, 25; v. 1), not to mention less significant changes. But in many other passages he has retrograded under the same influence.]—The tribe of Levi; by A. Kuenen. [A review of part of Dr. Land's papers on the state and religion of ancient Israel in *De Gids* for 1871. The question at issue is whether the Levites were originally a tribe or a party.]—Dijserinck's translation of the Apocrypha, part 1; rev. by A. Kuenen.

## Philosophy and Physical Science.

### DUTCH PSYCHOLOGY.

*Van der Wijck's Psychology*. [*Zielkunde*. Door Dr. B. H. C. K. van der Wijck, Hoogleraar in de Wijsbegeerte te Groningen. Eerste Deel.] Groningen: J. B. Wolters.

DR. VAN DER WIJCK is one of the most distinguished of the many able teachers and writers who are doing so much to make their country take the high position it is now taking in scientific and philosophical investigations. His previous writings, the most important of which is perhaps the small tract, *Oorsprong en Grenzen der Kennis*, have made him well known throughout Holland, where he is regarded as the legitimate successor of his master, Professor Opzoomer.

The present work will do much to extend his reputation; it is the first part of what will be, when it is completed, a very thorough and exhaustive system of Psychology. It contains an elaborate exposition of the author's method; two chapters, partly introductory, on the four degrees of human knowledge, and the connection between the soul and the body; and a very full and interesting discussion of the first part of psychological investigation—man as a sentient being. The second part of the work, which has not yet been published, will contain the results of Professor van der Wijck's researches regarding the intellectual and emotional life of man, and will conclude with a chapter upon the nature and exercise of will. This Dutch Psychology will therefore occupy the ground covered by Professor Bain's two large treatises on the Senses and Intellect, and on the Emotions and Will.

The chief interest which Dr. van der Wijck's work has for us, apart from its scientific value, is the position it occupies with regard to the works of English writers upon the same or kindred subjects. The author evidently means to take up an intermediate position between representative English and German psychologists. He wishes to avail himself of the results of English experiments and observation, without committing himself to the materialistic tendencies which are found in some of the more prominent among our psychologists, and he desires to make full use of German research and speculation, without accepting every German theory and assertion. This middle position between English and German psychology is the most striking characteristic of the book, and must be kept in view when we criticize it. Dr. van der Wijck has fitted himself for the accomplishment of his purpose by a careful study, not merely of English and German philosophy, but of the literature of the two countries. He is as familiar with Goethe, Carlyle, and Thackeray, as with Sir W. Hamilton, Herbert Spencer, Fechner, and Lotze; and this acquaintance gives a literary grace to his style which is often wanting in scientific treatises.

Professor Lotze, of Göttingen, and Professor Bain, of Aberdeen, are selected by Dr. van der Wijck to represent the best German and English schools of psychological investigation, and the *Zielkunde* is an attempt to mediate between these two philosophers. They, in the author's opinion, stand in the fore-front of psychological investigation in England and Germany, and, however worthy of notice other psychologists may be, are the only really representative men.

This selection of representatives shows us Dr. van der Wijck's own position. He accepts all the facts of the extreme sensational, not to say materialist, school, and at the same time is as strenuous an opponent as one could wish of the materialist or even sensationalist theories. He combines the materialist premises of Mr. Bain with the spiritualist conclusions of Professor Lotze.

In his final results, in sympathy, and in his whole conception of the science of psychology, Dr. van der Wijck seems to stand in a much closer relation to the German than to the English psychologist. Professor Bain has many things in common with Professor Lotze: a keen eye for fact, a sympathy with physical investigation, and the desire to bring mental science into as close a relation with physiology and biology as is compatible with its independent existence, but the real standpoint of the one psychologist is very far removed from that of the other. With Professor Bain psychology is merely the natural history of the mind in so far as it is related to the body. His psychology has no relation to metaphysics, except what is contained in the negative statement that there is not and that there can be no mental science and no philosophy except this enumeration and classification of phenomena. His psychology is a demonstration that metaphysic is impossible; and his essays in the

*Fortnightly Review* show that he more and more inclines to seek for a purely materialist basis for this psychology.

Lotze, on the other hand, has done more than any other living writer to combat the materialistic tendencies of modern thought. His early medical training has made him more tolerant of physical theories than most other psychologists are, and has taught him to observe carefully the physical correlates of mental phenomena; but he is no materialist. His aim is rather to accept every physical datum that can be given, recognise every physical and materialist explanation of mental phenomena ever brought forward, and from them to draw the conclusion that there must be much in the mind of man that no physical theory can account for. Psychology is with him the debatable land between physics and metaphysics—the first science where the mechanical laws of nature do not exercise unlimited rule, and where the ideal element, limitless and beyond law, must be recognised and accounted for. He is perpetually saying to the sensationist and materialist, “I accept every fact you can give me, every scientific deduction you can make, and I will, out of your own data and deductions, create a system of spiritual psychology, metaphysics, and philosophy of history, in which the *ideal*, and not the *mechanical*, will be the leading, ruling element.”

These, then, are the two psychologists between whom Dr. van der Wijck tries to mediate. He is not a materialist, nor has he the materialist tendencies of Professor Bain, but he as fully admits the close relations between physiology and psychology. He does not agree with Lotze in sharply distinguishing the mechanical from the ideal, but he denies that psychology is merely a branch of physical science, and that its laws are only applications of the laws of physical science. According to Dr. van der Wijck, psychology is the science of that class of facts which have the common name of Consciousness. It is the science of the phenomena of consciousness, not of what lies behind these phenomena; but the science of the phenomena is a warrant that there may be a science of what lies behind them. Psychology does not state that metaphysic is impossible—it introduces metaphysic.

Psychology and physiology are so nearly allied that it is often difficult to distinguish where the one science begins and the other ends, and to define precisely the relation of the one to the other. Speaking generally, the two sciences deal with the same set of facts, considered relatively as external and internal. Physiology is one of the natural sciences, and the one which corresponds to psychology; it deals with external phenomena only. Psychology is not one of the natural sciences, but it stands in close relation to them; it deals with both external and internal phenomena. Psychologists who claim for their science a distinct and independent existence must therefore be able to show that the internal phenomena of conscious life and the internal perception on which their existence rests are real things, not mere assumptions. If internal perception does not really exist, then Heine and Comte are right when they say that to think of psychology as more than a mere branch of physiology is as antiquated a conception as that which gave a separate existence to alchemy and astrology.

Is there, then, any distinction between external and internal perception, or is the internal only a refined form of the external? This question, on the answer to which depends the existence of psychology as a separate science, is, Dr. van der Wijck seems to think, merely a narrower form of the wider one:—Is there any fundamental distinction between the soul and the body, and, if so, what is the precise relation between them? For although the distinction between psychology and physiology is one that may be held both by

materialists and spiritualists, and although a thinker who denies that there is a spiritual substratum for spiritual phenomena may easily grant that the facts of internal perception are in themselves so distinct from those of external perception, and so thoroughly independent of anything save their own peculiar liability to retention and association, that they well may furnish the basis of a separate science, still the answer given to the question regarding the fundamental relation between the body and the soul almost always *does* determine the very existence of psychology, or at least the character and importance of the science. For practical purposes, therefore, it is not enough to decide whether there is a sufficient distinction between the phenomena of external and internal perception to afford a basis for the existence of psychology. The psychologist must investigate carefully the relation which exists between the body and the soul, and have some conception of the nature of the substratum which lies behind the phenomena of external and internal consciousness. Dr. van der Wijck discusses the whole of this very interesting subject in his third chapter—on the relation between the soul and the body—perhaps the most important in the volume. The summary of the chapter deserves to be quoted as an example of the author's careful and critical method, equally removed from hasty generalisation and over-confident speculation. The results are summed up under the following heads:—

“1. The *incomplete* data which tell us of the union between the soul and the body have furnished four hypotheses regarding that union, two of a dualistic and two of a monistic kind.

“2. The first form of dualism, pseudo-materialism, the common form in which the two factors are made to half-resemble each other, is a hypothesis full of inconsequences.

“3. The second form of dualism, an honest dualism, according to which brains and mind have something to do with each other merely because they are neighbours, seems to be improbable when tested by facts.

“4. The first form of monism, materialism, is the distracted metaphysic of men who suppose that metaphysic has nothing to do with the matter.

“5. The second form of monism, idealism, is the only hypothesis regarding the union of the soul and the body which at the same time agrees exactly with the facts, and which is also a theory consistently and correctly deduced from them.

“6. Every one knows and knows only his own soul. We make inferences about the souls of other men from physical events, which, at least so far as we ourselves are concerned, always accompany psychical changes.

“7. It is very uncertain how the life of the soul makes itself manifest in the realm of things; but this is certain, that in whatever way it does make itself manifest, it invariably is observed to be the reverse or the other, never the product, of the external phenomena.”

In his answers to the wider, as well as to the narrower, problem of the relation of external to internal conscious life, Dr. van der Wijck decides that psychology, while it is indebted in a variety of ways to physiology, is a distinct science, relating to a distinct set of facts, which depend on a distinct class of laws. The great evidence for internal perception is to be found in memory and recollection; they lay hold of and detain the internal perceptions, and so, as it were, give being and place to them, and bring them under the power of logic and within the scope of science. In psychology, sensations are the material element, and the laws according to which sensations combine and separate are the formal element—*i. e.* the facts of external and internal perception and the laws of association furnish the two factors of the science. But while Dr. van der Wijck thus gives a very important place to the principle of association, he does not consider it the one principle in psychology, as our English psychologists are accustomed to do. In the psychological writings of Mr. J. S. Mill and Professor Bain, the principle of association is continually used to beg the questions argued about. They main-

tain that the product which results from the inseparable association of several psychological elements is often quite distinct from any and all of its various factors, and by the introduction of this idea of chemical combination into mental science get over a serious difficulty which stands in the way of their theory. Thus conscience, according to Mr. Mill, is only the combination of various desires, which, when combined into one complex feeling, possess an entirely new character; but when Mr. Mill wishes to show that conscience is only educated desire, he reverts to its origin and growth, entirely ignoring that upon his own theory it has become a new whole, and is something quite different from the sum of its parts. Dr. van der Wijck does not make this very convenient, if not very accurate, use of association, and in this relation prefers to follow Professor Lotze, who introduces the idea of *development*. Thus, with Lotze, intelligence is not made from sensation by a process of association simple or complex: it *developes* out of sensation, and so becomes a new and distinct fact, which cannot be resolved back again into its primary elements, nor treated as if it were merely the sum of them. This idea of *growth* is discussed by Dr. van der Wijck with great freshness and critical power in his chapter on the four degrees of mental development, and is used to explain the phenomena of the several senses. The manner in which this idea is introduced and applied gives its chief scientific value to the book.

We have not space to refer to Dr. van der Wijck's description of the various senses, nor to his theory of the relation of what Lotze would call the mechanical and the ideal elements in each, and must refer the reader for further information to the book itself. It is a great pity that so much valuable work should be inaccessible to so many English readers, for we are in great need of a good handbook of psychology, and Dr. van der Wijck's would be very useful and well fitted to supply the deficiency. We shall expect with interest the second part of the book, which treats of the deeper and more attractive problems in psychology, and hope that both parts will ere long be translated and published in England.

THOMAS M. LINDSAY.

### Notes of Scientific Work.

#### Zoology.

**The Zoological Remains in the Kitchen-middens of Denmark.**—Some twenty years ago the Royal Academy of Sciences of Copenhagen appointed a committee, composed of Professors Forchhammer, Worsaae, and Steenstrup, to make enquiries into the history and contents of the kitchen-middens, which have hitherto been found more frequently and in a less disturbed state in Denmark than in any other country. The committee successively examined more than forty of these ancient depots of culinary refuse, and Professor Steenstrup has just published an abstract of a report read before the International Congress of Prehistoric Archaeology at Copenhagen (*Bulletin du Congrès international*, Copenhagen, 1872, pp. 135-174). These depots vary much in size; one of the largest—that of Meilgaard, in Jutland—has a length of nearly 500 feet, and a depth of as much as 12 feet; others having scarcely one-twentieth of this extent. They belong to the Stone age, and are made up chiefly of shells lying in an irregular manner, without any trace of an arrangement analogous to that of deposits formed by the action of water. These shells consist, one and all, of species still used as food for man, viz. oysters, mussels, periwinkles, and cockles; and all the individuals are adult, young specimens being entirely absent. Mixed with these shells are enormous numbers of bones, especially vertebrae, of the fishes of the cod-, flatfish-, and eel-tribes. The remains of birds are chiefly those of natatorial and grallatorial kinds; those of ducks are the most numerous, while the bones of the wild swan—which, at the present period, visits Denmark in the winter only—are not uncommon. But most interesting of all are the remains of the now extinct great northern diver (*Alca impennis*), the former occurrence of which in Denmark is thus placed beyond doubt, though no traces of it have hitherto been found in other parts of the country; and of the capercaillie (*Tetrao urogallus*), which is also extinct in Denmark. The discovery of the latter bird in the kitchen-middens sheds an un-

expected light on the vegetation of the country at the period during which these deposits were formed. As it is known to live only in fir-forests, the leaves of which form its principal food, it must have been obtained by the inhabitants at that prehistoric time when the pine flourished in Denmark—a tree which has been succeeded by the oak, and, still later, by the beech. Mammalian remains are likewise very common, especially those of the common deer, roe-deer, and wild boar. On the other hand, it is remarkable that no traces of either the eland or the reindeer have been discovered, though bones of these two species have been met with in the peat-bogs of the country. The fallow-deer does not appear to have reached Denmark before the middle ages, and has evidently been imported. The remains of the *Bos primigenius* or the *Bos urus* of Linnaeus and Nilsson are less abundant; and while all proof has hitherto been wanting of the existence of this large ruminant in the Bronze and Iron ages, it is beyond question that it lived in Denmark during the period of the pine. This is supported by the fact that beside those remains from the kitchen-middens, an entire skeleton has been found in a stratum composed of pine-trunks, and it was ascertained that the contents of the stomach of the same individual consisted of the foliage of that tree. Of the bones of carnivorous animals, Professor Steenstrup determined the presence of those of the domestic dog, fox, rock- and pine-marten, otter, and seal (*Halichocerus grypus*), as well as of the wild cat, lynx, and bear—these three species being now extinct in Denmark. Remains of the wolf are very scarce, although this animal has been exterminated only in the last century. Bones in small number of the porpoise, beaver, hedgehog, and water-rat, make up the list, in which, singularly enough, neither the hare, rabbit, nor squirrel is mentioned. On examining the bones of these animals, it was found that the long marrow-bones of the ruminants and wild boar are invariably split by a blow on the conchoid surface, which must have been done for the purpose of extracting the marrow. Long bones of birds which do not contain marrow had never been treated in this manner. Moreover, all the mammalian bones show unmistakably signs of having been gnawed by some carnivorous animal, that removed all the softer and more spongy portions, or destroyed bones of a similar texture, such as the vertebrae or crania of birds, altogether. As this has been done in a uniform, almost systematic, manner throughout the various layers of all the deposits, M. Steenstrup comes to the conclusion that it is the work of an animal living in a state of domesticity with the people who formed the deposits. Comparative experiments made by the reporter have proved that dogs which have free and daily access to the bones of mammals and birds leave exactly the same bones, or the same parts of bones, which have been found in the kitchen-middens.

**Notes on the Birds of Damara Land and the adjacent Countries of South-West Africa.** By the late Ch. J. Andersson. Arranged and edited by John Henry Gurney. London.—The editor pays a just tribute to the indefatigable zeal of the late Ch. Andersson by devoting an introductory chapter to a biographical sketch of this unfortunate traveller. The birds enumerated in the body of the work amount to 428 species, of which by far the greater number were obtained by Andersson himself; a few, however, that he did not meet with, but which have been satisfactorily ascertained on other authority to have been seen in the districts referred to in the present volume, are included in order to make the list of the birds known to inhabit these countries as complete as possible. As sufficient descriptions of most of the species have already been published in the works of Layard and others, the editor has contented himself with extracting from the manuscripts of Andersson, who had contemplated publishing a work on the birds of South-West Africa, such portions as contain personal and original observations. The nomenclature and the principal references, as well as numerous additional notes on specific distinction, geographical distribution, &c. are the work of the editor.

#### Chemistry.

**Tridymite.**—In a continuation of his "Mineralogische Mittheilungen" in *Poggendorff's Annalen*, No. 10, 279, Professor Vom Rath communicates some further information respecting the occurrence of this interesting mineral. From a letter addressed to the author by Professor Wolf, of Quito, it appears that it has been met with at a village named Tumbaco, lying at the foot of a small extinct volcano, Ilaló, three hours north-east of Quito. In driving a shaft through the volcanic tuff that covers the district, a block of very porous andesite was hit upon, the druses of which, varying in size from 2 m.m. to 1 c.m. in diameter, were filled with little tables of tridymite. The crystals likewise apparently lie in the mass of the rock itself, in which crystals of a triclinic felspar, hornblende, and magnetite could be seen with a pocket-lens; quartz, though it frequently accompanies tridymite, was not observed in this block. Some of the thin hexagonal plates were from 3 to 4 m.m. in diameter.—Dr. Krantz also observed the occurrence of this form of silica in a reddish-brown porous trachyte from Stenzelberg, in the Siebengebirge. The rock contains crystals of a lime-soda felspar, hornblende, augite, and magnetite, while the cavities are lined with the

little tabular crystals of tridymite more thickly and abundantly than in the earlier specimens from other localities. An examination of this rock has impressed the author with the belief that the silica constituting the crystals has not been derived from the rock itself, but that solutions or vapours containing silica have during their passage through its mass deposited that substance in the form of tridymite in the cavities.—After many a fruitless research for tridymite in the rocks of the district round Naples, of Ischia, Cumana, and Monte Olibano, it has been found by Professor Vom Rath in a block erupted by Vesuvius in 1822. The rock is a finely grained mixture of sanidine, garnet, and augite. The druses are for the most part filled with sanidine, and on some of the crystals of this mineral little rounded masses of hexagonal plates of tridymite occur. It is interesting to find that the physical characters of these very crystals were described by Scacchi twenty years ago in his paper on Vesuvian and Monte Somma silicates formed by sublimation.—Tridymite has also been detected in the eruptive rocks of the Palatinate by Streng, who has found it in the porphyrite of Waldböckelheim (*Jahrbuch für Mineralogie*, No. 5, p. 628).

**Dulcitamine.**—This name has been given by G. Bouchardat (*Bulletin de la Société chimique*, xvii. p. 539) to a new organic base,  $C_6H_{11}NO_3$ , derived from the sugars. The hydrochlorate is produced by the action of ammonia on the hydrochloric or hydrochromic ether of dulcite,  $C_6H_{11}O_6$ , at  $100^\circ$  in the following way:—

Dulcitamine expels ammonia from its compounds, acts powerfully on litmus, and absorbs carbonic acid from the air. The hydrochlorate forms double salts with the chlorides of gold and of platinum, and in all its properties bears a great similarity to glyceramine,  $C_3H_7NO_2$ . It establishes new resemblances between the triatomic alcohol, glycerine, and the hexatomic alcohol, dulcite.

**The Manganese in Vegetable Tissues.**—An elaborate paper by A. Leclerc, on the quantitative determination of the amount of this metal present in soils and trees by a method devised for the purpose, and adopted some time since at the "Station agronomique de l'Est" at Nancy, is published in the *Comptes rendus*, 11th November, p. 1209. After the name of each of the following woods is given the percentage of manganic oxide,  $Mn_2O_3$ , present in its ash: fir, 4.507; oak, 1.488; beech, 5.307; elm, 7.454; lime, 3.744; alder, 1.965; &c. The percentage of the same oxide in the soil of the fir was 0.037; in that of the oak, 0.186; and in that of the beech, 0.110. What portion of the wood of each tree was chosen for the experiment is not stated.

**Kongsbergite.**—This name has been given by F. Pisani (*Comptes rendus*, 18th November, p. 1274) to a new native amalgam of silver from Kongsberg, in Norway. It occurs in cubes, the sides of which are a centimetre in length, and strongly truncated by octahedral faces. It has the composition: silver, 95.10; mercury, 4.90; which corresponds with the formula  $Ag_{11}Hg$ . Another specimen of so-called native silver from the same locality had the composition  $Ag_8Hg$ , or that of arquerite.

**Action of Palladium-Hydrogenium on Organic Compounds.**—Saytzeff, in the *Journal für praktische Chemie*, No. 13, p. 128, states the results of his experiments with this agent. Chloride of benzoyl is converted into benzoic aldehyde; this reaction does not take place when platinum-hydrogenium is employed. Nitrobenzol is changed into aniline, nitrophenol into amidophenol, and nitrocarbol, or nitromethane,  $CH_3NO_2$ , into methylamine. Oxalic acid furnishes traces of formic acid.

**The Incandescence of Iodine Vapour.**—According to G. Salet (*Poggendorff's Annalen*, No. 8, p. 320) the vapour of iodine may be raised to redness like a solid or liquid body, that is to say, at high temperature it emits only slightly refrangible rays, which give a continuous spectrum. If it be heated in a glass tube, it will be observed to emit light at a temperature at which the glass is barely luminous. An interesting form of the experiment is described in which the iodine is rendered incandescent with a battery current in an exhausted tube, when the light emitted becomes very distinct.

**Pyrology, or Fire Analysis.**—This is the title of a most astonishing paper by Captain W. A. Ross, in the current number of the *Proceedings of the Royal Society*. For his experiments the author uses the flame of a lamp containing cocoa-nut oil and an ordinary mouth blowpipe, or, as he terms them, a "hydrocarbonous pyrocone" produced by a "pyrocone." One or two of the reactions which he observed, by submitting substances to the action of the "reducing" and "per-oxidizing pyrocones," will suffice to indicate the nature of his paper. Silica and alumina, which, by the way, he calls "two omnipresent and almost universally combined earths," become quite black and apparently decompose; the alumina "appears to become partially fused," while the silica presents a steel-black mass with shining metallic points in it. Sulphur, when the flame is regulated as he directs, also assumes a metallic appearance, and "has no further tendency to burn," but possesses the (as he rightly names it) "remarkable property" of giving in a bead of phosphoric acid reactions similar to those of copper, viz.

green hot and blue-green cold, &c. He even detects nitrogen with the blowpipe. By repeatedly dipping a bead of phosphoric acid into concentrated nitric acid or ammonia, and heating it as often in the "hydrocarbonous pyrocone," a metallic-looking film is formed, and the bead, "thus impregnated with nitrogen," develops colour which serves to distinguish this element from alkalies, "the volatilisable oxides," &c. Still more unaccountable perhaps than any of Captain Ross' results is the fact of their having engaged the serious attention of the learned body in whose journal his paper has appeared.

**Phosphotungstic Acid.**—By adding phosphoric acid to a hot solution of bitungstate of soda, and allowing the liquid to cool, triclinic crystals of a sodium salt containing the two acids separate. By converting them into the barium salt, decomposing this in hydrochloric acid, and removing the barium with sulphuric acid, the solution on concentration deposits fine regular octahedra, having a strong refractive power and adamantine lustre, of the double acid phosphotungstic acid. Scheibler, who made this compound (*Chemisches Centralblatt*, 45, 709), has obtained another form of the double acid, by using the ordinary tungstate in the place of the bitungstate, which is distinguished from the above in not crystallising in the cubic system. The two kinds of the double acid appear to correspond to the fullest extent with the two varieties of silicotungstic acid prepared by Marignac. The variety of phosphotungstic acid that forms octahedra is remarkable for its behaviour with solutions containing organic bases. From a liquid containing 200000 of strychnine, or 100000 of quinine, those bodies are thrown down as voluminous flocculent precipitates, which soon become more compact, and can readily be collected on paper, and washed out with slightly acid water.

**Normal Hexylic Alcohol, a Constituent of the Essence of Heracleum Giganteum.**—A very interesting paper by A. P. N. Franchimont and T. Zincke on the chemical examination of a large quantity, more than 500 grammes, of this essential oil, which had been placed at their disposal by Dr. Hugo Müller, is printed in the *Archives néerlandaises*, vii. 3<sup>ème</sup> liv. This oil consists of a mixture of about three-fourths butyrate of hexyl and one-fourth acetate of octyl. By means of the octylic alcohol the authors prepared a nonylic acid.

## History.

**The Roman Annalists.** [*Die römische Annalistik von ihren ersten Anfängen bis auf Valerius Antias.* Kritische Untersuchungen zur Geschichte der älteren Republik von K. W. Nitzsch.] Berlin : Gebrüder Bornträger, 1873.

GOETHE once said that we only understand things of which we are able to trace the development, and the expression characterizes exactly the intellectual basis of the scientific methods of the present century ; our method, like our whole culture, is preeminently historical. Philology, since it has ceased to be exclusively occupied with the comparatively short period of greatest brilliancy in the life of a nation, has acquired a different character and a different horizon. It has turned its attention to the less cultivated and polished language of earlier times, or reaching even farther back, it seeks for parallels and derivations in allied languages to place in the proper light facts which, according to the old method, must have remained unexplained. Jurisprudence, which formerly dated its existence from Justinian, now concerns itself by preference with the history and development of Roman law from the Twelve Tables onwards. Even the exact physical sciences have not been able to resist the common tendency, and in some of them the historical method is the only possible. Geology, for instance, may be called a plastic presentation of the history of the revolutions of the earth. All the most exciting scientific questions of our time refer to the origin and growth of the universe, and the modifications to which its individual parts have been subject. As was to be expected, the historical method could not long fail to be applied to history itself. The first modest attempts were made upon the mediaeval historians ; here the work and the workmanship is coarser, so that it is easier to resolve the former into its elements. But before long, encouraged by Niebuhr's success, the same methods and the newly won experience were applied to the authors of Greek and Roman antiquity with brilliant results. Every year sees the appearance in Germany of a number of monographs "de fontibus, &c." or "de ratione quae intercedat, &c." England still stands towards the movement in an attitude of suspense, and receives its conclusions with a degree of mistrust, when the reports of ancient historians are resolved into their component parts by severely analytic criticism. Wrongly so, as it seems to me. To find a parallel in modern times, let us put ourselves in the place of a historian wishing to write the history of the recent Franco-German war a century or two hence, but limited to a single work compiled from the reports of the German general staff, from the correspondence of the *Figaro* or the *Gaulois*, and perhaps from the journals of a delegate from the Geneva committee. Common sense will compel him to distinguish between the different parts of what his authority gives uncritically as a whole. He will have to ask himself in every case which of the various sources supplied a given piece of intelligence, and what degree of credibility, what sympathies, and what tendencies he must presuppose in the writer. And in thus distinguishing, will he not have to pay special attention to

trifling external indications, such as whether distance is reckoned by miles or kilometres, whether a quotation is taken from a French or a German author ; the circumstances of which nation are described with special knowledge and sympathy, &c. ?

Our position is exactly similar in respect to Livy's great historical work, which is based upon authorities of just such heterogeneous nature and quite as various grades of credibility. Nitzsch is not the first who has approached it with the critical scalpel. It is ten years since Nissen's *Kritische Untersuchungen über die Quellen der vierten und fünften Decade des Livius* (Berlin, 1863) made an epoch in the study of Livy by pointing out for the first time—though only for two decades—not only the way in which he made use of the sources at his command, but also the authority that he must have followed for each separate section. Nissen had dedicated this work to his former instructor, Nitzsch, who now in his *Römische Annalistik* includes especially the three first decades in the circle of his researches, in order to distinguish the data before us according to their value and credibility, that we may not be reduced to the melancholy alternative of either rejecting everything like Cornwall Lewis, or accepting everything like, for instance, Bröcker. While Mommsen and Rubini have dwelt chiefly in their investigations on the politico-juristic side of Roman history, and in this direction have achieved the most brilliant results, Nitzsch works chiefly by external criticism of the text of our literary authorities. The two methods, so far from excluding each other, if rightly applied, serve for mutual support.

The kernel of the present work, round which the rest crystallizes, is the circumstantial comparison of Liv. ii. i.-iv. 8 with Dion. Halic. v. i.-xi. 65, and had already been published in three articles in the *Rheinische Museum*. In the present work, the course and conclusions of this investigation are briefly recapitulated, and in connection with this follows a history of Roman annals down to Fabius Pictor, and then again down to Valerius Antias. The course of the special investigation is extremely interesting and instructive to follow. From discrepancies in the accounts of *cognomina*, and the beginnings of the years given in different parts of Livy, as well as by Dionysius of Halicarnassus, Nitzsch infers the use of different authorities, and distinguishes an earlier and a later source. Besides some circumstantial descriptions (p. 51), he refers to the earlier authority all the short annalistic notices which for the most part report laconically of scarcity, war, inundation, epidemics, &c. Then Plutarch's *Life of Publicola*, which is admitted to be based on the work of Valerius Antias, is brought into requisition for the sake of comparison with those passages which Livy and Dionysius both derive from the later sources. Nitzsch shows very ingeniously how the writer takes every opportunity of exalting the members, both male and female, of the Valeria gens ; how he must belong to the age of Sulla, because he introduces into the earlier history of Rome ideas which were then being formed for the first time ; this is apparent from the position assigned to the tribunes of the people, which was entirely changed by Sulla, from the conception of the plebs, from the supposition that a law was not valid without the *senatus auctoritas*. When we consider that Valerius Antias was a contemporary of Sulla, and continued his history down to the death of Sulla, we may readily admit the correctness of our author's view that the more recent of the two authorities was none other than Valerius himself.

In the second section of his book (pp. 189-355), the author gives a "history of Roman annal-writing" down to Valerius Antias ; he begins with the *Annales maximi*, and naturally

has to discuss Livy's extraordinary statement that all historical monuments had been destroyed when Rome was burnt by the Gauls, while notwithstanding fragments plainly belonging to an earlier date than 390 B.C. can be distinguished amongst the materials which have reached us. Niebuhr and Schwegler explained this curious phenomenon by supposing the existence of short chronicles and family papers. Mommsen assumes that the earlier fasti were both restored and falsified after the conflagration. Nitzsch, on the other hand, assumes a double foundation for the *fasti*: first the records of the high-priests of the temple of Saturn, and, secondly, the fasti of the *aediles plebis* in the temple of Ceres. The author is led to this assumption of aedilian fasti by the peculiar care with which the fortunes of the temple of Ceres are recounted, and by the interest manifested in the Hellenic institutions of Rome, and in the history of Upper Italy. As to the first point, although before the *lex Ogulnia* there was no plebeian pontifex maximus, yet it seems to me that even a patrician would have sufficient reasons for paying attention to the fasti of the temple of Ceres, the centre-point of the religious and sacred interest of a class of such growing importance and influence as the plebs. The second point, on the contrary, seems to be unfavourable to the author's assumptions, for interest in Hellenic culture might be looked for anywhere rather than amongst the plebs, a stationary peasantry, which in those times, as at present, had a conservative aversion to everything of foreign origin. This is clearly seen in Cato, who, sprung from this class, is the best representative of the old plebs in its virtues as well as its failings. Intercourse with Greece, and attachment to Greek civilisation, was a privilege of highly educated aristocratic circles, such as the Scipios. A further argument against the assumption of special aedilian fasti is supplied by the remarkable agreement in our accounts, which do not at all admit of subdivision into two groups. This difficulty in the way of his hypothesis has not of course escaped the author, and he endeavours to remove it by assuming both sources to have been combined and harmonized at a comparatively early period. In the course of his investigation, Nitzsch suggests the further question, when and by whom the fasti were withdrawn from the temple and made public. The first question has been answered by Mommsen to the effect that the last arrangement of the fasti in the shape which has reached us must date from soon after the second Samnite war. Nitzsch accepts this view, and proceeds to connect with it the plausible supposition that the publication of the fasti was carried out by Cn. Flavius, the protégé and partisan of Appius Claudius, to whom the plebs was indebted for publishing the *legis actiones*, and the calendar. This also explains how all these notices express so much reverence for the house of Claudius, and so decided an animosity against the Fabii.

Popular poetical legends and ballads formed another important element used by the Roman annalists in their works. Even Niebuhr had called attention to the well-known passages in Cato and Varro in which it is told how noble boys used at that time to recite the praises of their ancestors to the sound of the flute. But while English writers familiarised themselves with this important conception, and even succeeded in imaginary imitations of the old poems, it was almost entirely abandoned in Germany, apparently under the influence of the Hegelian philosophy of history, according to which the Romans, as the people of law, could not, it was supposed, also have possessed a considerable body of popular poetry. It is Nitzsch's merit to have brought this undoubtedly correct idea of Niebuhr's again into esteem, and to have developed it in greater detail by parallels from the historical poetry of Scotland,

Germany, and Servia. This wider view, which also includes the literature of mediaeval historiography, enables the author to draw illustrations from similar appearances in that literature, and so to elucidate the obscure and difficult passages of ancient history-writing: several brilliant examples of this kind are to be found in the present work. The discussion on Fabius Pictor, his literary position, his conception of the constitution and the political history, are also very well worth reading. Nitzsch compares him very aptly with the aristocratic annalists of the sixteenth and seventeenth centuries. As with Valerius Antias the glorification of the Valerii, so with Fabius Pictor the glorification of the Fabian house, and especially of Fabius Maximus Cunctator, is an object of which the writer never loses sight. Valerius has of late been made an universal scapegoat, and though generally, not quite always, with good reason. The careful and deliberate research which Nitzsch has brought once more to bear on the question leads, however, to the result that the greater part of the accusations brought against him is well founded. Valerius Antias is far inferior as an historian to his predecessor Fabius Pictor; in Nitzsch, his sincerity and reliability appear in the most deplorable light: not only because he introduces his own views and political conceptions into the earlier history of Rome, but from the absurd way in which he thrusts his own family into the foreground on every occasion, which is only less intolerable than his disinterested delight in lying, and a habit of colossal exaggeration, especially in reference to numbers. We must unfortunately agree with the author that Valerius Antias marks an epoch in the history of Roman annals, for whereas formerly the annals stood alone, after him a rich memoir-literature arose to dispute the field with them, but they did not end with him, and it is therefore to be regretted that the author, who possesses rare aptitude for the work, should not have continued to trace the annals down to their latest degeneracy.

It would also have contributed to the practical convenience of the book if the author had not disdained to supply a summary table like that given by Nissen (*l. c.* p. 340), in which the authorities for each chapter are briefly indicated.

But such trifles cannot of course affect the value of the book, which we cannot recommend too warmly, especially to those to whom this mode of analysing ancient authorities is still unfamiliar.

V. GARDTHAUSEN.

### Intelligence.

The Leipzig publishing firm of S. Hirzel has distinguished itself within the last generation by issuing standard historical works of various descriptions. German literature owes to it the substantial collection of the *Staatengeschichte der neuesten Zeit*, and an important series of publications under the superintendence of the Munich Historical Commission, *Chroniken der deutschen Städte*, both still in progress, as well as some widely popular books, viz. Gustav Freytag's *Bilder aus der deutschen Vergangenheit*, and the same author's excellent biography of Karl Mathy. In this respect Hirzel's catalogue alone would furnish very interesting evidence how considerably both the sound study of history and historical art has been advancing for more than thirty years. Such observations are suggested by three books which Hirzel has published within the last few days.

The highest praise in every respect is due to the second and concluding volume of *The Life of F. C. Dahlmann*, by Anton Springer, which at this time, indeed, is enjoyed by a very large circle of readers all over Germany. It takes up the narrative where the first volume, published about two years and a half ago, left off, viz. after the celebrated crisis in 1837, when the Duke of Cumberland, as King of Hanover, expelled seven professors from the university of Göttingen for adhering to the constitution to which they had sworn. Dahlmann, the two Grimms, and Gervinus were for a considerable time without home, study, or professional chair, since not one of the German governments of the day ventured to provide for them in the teeth of the Bundestag, by which Hanover was supported. Their cruel and unjust

treatment, however, roused public opinion almost for the first time. In order to support those among them who were in want, means were collected by a liberal association of wealthy patriots, chiefly publishers, as well as some authors at Leipzig and Berlin. Dahlmann was thus enabled to spend four quiet years, busy with his history of Denmark (3 vols. in the collection of Heeren and Ukert), which raised his name to the first rank of German historians. In 1842 Frederick William IV. gave him the chair of history and public law in the university of Bonn, which he held until his death in 1860. There would, indeed, be very little worth mentioning from the literary, academical, and personal life of the professor if it were not for the reason that he became one of the fathers of constitutional theory and of the aspiration after national unity which has borne fruit in the present generation. By his famous lectures on Politics (the term being meant in the sense of Aristotle) and on various branches of history, by two small books, almost pamphlets, on the English and French revolutions, but immensely popular in their day as political programmes (both published in 1844 and 1845 by Hirzel's firm), and chiefly by the prominent share he took at Frankfurt, Erfurt, and Berlin, in the endeavours to frame a national constitution for Germany, he displayed a consistent power of mind, word, and character, such as did very few other collaborators in that great but unsuccessful struggle. This character is now delineated by the biographer with masterly art and taste, where possible, in the nervous and pregnant utterances of Dahlmann himself. Extracts from his letters, sayings, and speeches, are intermingled with letters from his correspondents, among whom the most illustrious names are not wanting. In addition to Bunsen's and Stockmar's *Memoirs*, the present volume contains perhaps the most attractive disclosures with regard to the constitutional throes from which twenty years later modern Germany took its origin. Very curious is a project of federal reform submitted to Dahlmann from London by Prince Albert, but still more its criticism by the late King of Prussia, almost inconceivable on account of its vapid, romantic, and entirely unserviceable dreaminess, whereas a letter by the Prince of Prussia, the present Emperor, shows that he as early as then entertained the same notion with Dahlmann, namely, that liberty without power would not be of much use to the Germans.

A book of a very different kind is *Frans von Sickingen*, by H. Ulmann, Professor of History in the University of Dorpat. The hero is probably much less known in England at present than he was in his own time, in the days of Henry VIII. The materials for his personal biography are scanty enough, yet having been an important actor in that great drama of the world's history, the first upheaving of the Reformation period, within the frontiers of his country as well as without, his connections and his deeds had to be searched for in the stores of many a home record-office, and in the recent official publications of foreign countries as well. This has been done by the author with untiring perseverance at Weimar, Cassel, Coblenz, Vienna, Munich, Frankfurt, Strassburg, Dresden, &c., not omitting what is to be found in print in the collections of Le Gay and Lanz, as well as Brewer's wonderful *Letters and Papers of the Reign of Henry VIII.* Dr. Ulmann knows at the same time how to handle his researches and how to write a vivid description of the man and his time which throws all former attempts into the shade. Sickingen, much more than Götz von Berlichingen, is the representative of the free knights of the empire, who, unfortunately for themselves and for the community at large, were never moulded as a political estate into the unwieldy constitution of the Holy Roman Empire, but waged lawless war alternately against the cities and their commerce, against the princes and their territories, or against the emperor himself. This book for the first time discloses the short and romantic, but chequered, career of that powerful knight, who, from his strongholds in the Palatinate (now still existing, but merely in picturesque ruin), with his horsemen, his bands of "Landsknechte," and his artillery, attacked the walls of Worms and of Metz, and, after having been the ally of Francis I. one day, immediately afterwards was on terms again with Maximilian. Nothing, however, is more interesting than his joining the great movement started by Luther himself, the most celebrated man of his own order, the fiery knight Ulrich von Hutten, being his chief guide. For a short time Sickingen seemed, indeed, to head the imperial party of Charles V. soon after his election. Yet the Diet of Worms, 1521, was the turning-point in his life. The confederation of the knights, with Sickingen as their chief, was a power far too strong and too dangerous, not only for the members of the empire and the imperial government, but for the material and spiritual prosperity of the nation. By his attack on Trier in 1523 he drew down upon himself and his order a catastrophe similar to that which a few years later overtook the German peasantry. His death after the capture and amidst the smoking ruins of his Ebernburg, with the allied victorious princes looking upon the dying man (according to the most authenticated reports), abounds in dramatic and tragical effects.

The third work published by the same firm belongs to the class of hitherto unprinted or little known materials for local history of a distinct period. *Basler Chroniken*, "herausgegeben von der historischen Gesellschaft in Basel," vol. i., edited chiefly by two young historians,

Professor W. Vischer, at Basel, and Dr. Alfred Stern, at Göttingen, are unquestionably suggested by the excellent collection of the chronicles of the German cities, undertaken by the Munich Commission. They show what magnificent materials are still to be found in the archives of a small but in some respects leading community like the city and canton of Basel. The volume contains one of the chief sources for the Reformation period of the little state, viz. the chronicle of Fridolin Ryff and his continuator, Peter Ryff, written in German, and from the other side of the movement four accounts, which were written in the Charterhouse of Klein-Basel, the first three in Latin, and the fourth in German. We have seldom met with a more lively description of the highly disturbed social aspect from the very midst of the dissolution of an important monastic foundation than that preserved in the last document (1522-1532), which is not unlikely the work of the last vicar of the house, who remained in the precincts after the prior and part of the monks had left. Every piece is most carefully edited, with an abundance of introductions, notes, addenda, indices, and maps, in the true spirit of methodical investigation, and with a philological and palaeographical exactness such as hitherto has been very rarely applied to Latin or vernacular texts of that period. The series is to be completed in four volumes, and will be another striking monument of that spirited little republic, distinguished again and again both by its wealth and by its taste for learning and literature.

The publication is announced of the eighth and last volume of Gregorovius' *Geschichte der Stadt Rom*. The author, whose work procured him not long since the honour of Roman citizenship, concludes it by an eloquent expression of satisfaction that he has been permitted, while writing in Rome of the history of Rome's struggles and sufferings, to witness their only possible and natural conclusion, the "new birth of a people of free citizens."

### Contents of the Journals.

Von Sybel's *Historische Zeitschrift*, part iv., contains a description by Lipsius of Irenaeus' position in the development of the Church System; and an account of the Hanseatic League's factory at Bruges (in England privileges were granted to the merchants of Cologne, the "homines Imperatoris," as early as Aethelred's time), which consolidated the privileges previously granted to German merchants.—A notice follows of the question whether Copernicus is more fairly regarded as a Pole or as a German, and a summary of the German and French books on the late war.—Among the shorter reviews are one of Monod's book on Gregory of Tours, whose genuinely barbarous Latin has yet to be restored from the MSS.; and one of Haddan and Stubbs' *Councils of Great Britain and Ireland*, which is highly praised by Pauli.

### New Publications.

NEWMAN, J. H. *Historical Sketches*. (The Turks in their relation to Europe; M. T. Cicero; Apollonius of Tyana; Primitive Christianity.) Pickering.  
TESSIER, J. *L'Amiral Coligny. Étude historique*. Paris: Sandoz et Fischbacher.

### Philology.

*Tituli Statuariorum Sculptorumque Graecorum, cum Prolegomenis*. G. Hirschfeld. Berlin, 1871.

WHAT with the spread of casts, careful engravings and photographs, and what with important discoveries of recent years, like that of the Mausoleum at Halikarnassos, and the monuments of Xanthos, in Lycia, a certain standard of appreciation has now been pretty generally arrived at with respect to the great masters of Greek sculpture, from Pheidias downwards, in merit and in time. As far as they are concerned, little more can be done at present except to correct details in the estimate already formed, and by careful and minute examinations of such of their works as exist to bring the proper services of each artist into such a light that we may be able to realise the manner and rate of the decline. As regards the forerunners of Pheidias, materials are more scanty and opinions more divided; but, meanwhile, it seems to be felt that the best way of coming to a just judgment on their respective merits is by this same method of examining closely the technical and artistic details

of such early works as exist, and comparing the results with the written records that remain.

One of the consequences of this moderate temperament of criticism, which now takes the place of the old familiar platitudes, is an extraordinary assiduity in the collection of every scrap of ancient record touching artists and works of art, whether handed down by writers or left by artists themselves upon their works. In proof of this it will be sufficient to refer to the various publications of learned societies, such as those of Rome and Berlin, to Overbeck's *Antike Schriftquellen* (1868), and to the work now before us, the purpose of which is, first, to give a complete list of the known inscriptions placed by Greek sculptors on their works, and, secondly, to present such considerations as arise from a thorough comparison of the same. On comparing them geographically, we see where the principal centres of the art were, and on comparing them chronologically, we see how these centres moved from time to time, how the art of sculpture in the round, as opposed to relief, which had long been practised, took first footing in the islands of Crete, Samos, Chios, Naxos, and Aegina, how, after flourishing among the Dorians in Crete, it passed over to their kindred in the Peloponnesian towns of Sikyon, Corinth, and Argos, and how, finally, after being taken up by the Ionians, it reached its culmination in the works of Pheidias at Athens and Olympia. The chronological arrangement, however, except in the case of early inscriptions, where the form of the letters alone is almost sufficient to determine the date, is often beset with difficulties, and opens up, among other questions, one of considerable interest, if for no other reason than the quantity of discussion it has already raised. It is now, indeed, generally accepted that, in using the verb *ποιῶν*, the early sculptors, from Olymp. 40-60, chose the imperfect tense, as *Θαρίμαχος ἐποίει*, that from Olymp. 70-158 the rule was to use the aorist *ἐποίησεν*, and that from Olymp. 158 downwards the imperfect again came into regular use. But in the times of Winckelmann, Lessing, Letronne, and R. Rochette, when almost the only artists' inscriptions known were such as had been found in Italy, and before the distinction had been sharply drawn between archaic and what is called archaistic work, there was not enough evidence to show that both tenses had not always been concurrent; that, in fact, the later use of the imperfect was simply an archaicism. The difficulty was complicated by an unhappy statement of Pliny (*N. H.* § 26) that Greek artists, as if from a modest sense of incompleteness in their works, generally employed in inscribing them the equivalent for *faciebat*, and that he was not aware of more than three instances of the equivalent for *fecit*. These instances not being produced, it was open to assume that his equivalent for *fecit* might as well have been the aorist as the perfect tense of *ποιῶν*, though the latter seemed to suit the drift of the context better, and to be justified by its absence from inscriptions. The aorist *ἐποίησεν* was certainly the usual equivalent for *fecit*, and those who maintained it to be the true interpretation in this case pointed confidently to the rarity of that tense in the inscriptions then known, and supposed Pliny to have spoken loosely from personal observation of the inscriptions around him. Whatever may have been the meaning he attached to *fecit*, it is now clear that he was entirely wrong in saying that Greek artists in the time of "Apelles and Polyclethus" systematically employed the imperfect. Not by way of excuse, but as a means of accounting for his statement, it should be remembered that not only was *ἐποίει* in constant use among the later Greek artists in Italy, but that wealthy Romans who had carried off masterpieces of sculpture from Greece, leaving the bases behind as cumbrous material,

would naturally, in having fresh inscriptions put on, which they were zealous in doing, use the form current in their day.

While claiming, on this and several other interesting questions, to have done little more than to have stated clearly the results of researches made by others, Dr. Hirschfeld comes forward with a new and original theory concerning the custom of Greek artists in adding their father's name to their own, as *Λύκιος ὁ Μύρωνος*. It is in itself probable that in ancient times a son followed the profession of his father even more frequently than now, and this is not unlikely to have been especially the case among artists, in whom zeal for their profession has always been a marked characteristic. It is also probable that an outsider who could force his way in such a profession would be conscious of rare talent, and endowed with sufficient vigour to raise him to eminence. As compared with these probabilities, we have the facts that the names of the fathers of Myron, Polykleitos, Alkamenes, and Agorakritos, all celebrated artists, are unknown; that, out of seventy-four instances in which the name of a sculptor's father occurs in inscriptions, it is thirty times the name of an artist known from other sources; that, in the inferior art of gem-engraving, out of about twenty indisputably genuine engravers' names, the only instance which records the name of the artist's father happens to be that of the well-known Dioskourides: while in the art of vase-painting and vase-making we find, out of about seventy artists, only four instances of the father's name being added, and of these, three were distinguished in the same profession. Relying on these facts, Dr. Hirschfeld boldly lays it down as a law that an artist did not append his father's name unless his father had been at the same time his master and instructor. Unfortunately for the utility of this law, it has to be admitted, on the example of Praxiteles, that artists who were sons of artists did not in all cases add their father's name, so that Myron and the other three sculptors mentioned with him above may have been guilty of filial disrespect, rather than entitled to the praise of having made their own way in their profession. Still, this substantial advantage would be gained, that the list of ancient sculptors would be increased by forty-four. Without accepting the theory as completely established, we would not for a moment withhold from Dr. Hirschfeld the praise which he has most undoubtedly earned by the thoroughness, clearness, and modesty of his work, the utility of which will be readily recognised by those who are seriously occupied with the history of Greek art.

ALEXANDER S. MURRAY.

*Researches in Furtherance of Assyrian Archaeology.* [*Ricerche per lo Studio dell' Antichità assira.*] By Felice Finzi. Turin: Loescher.

THE premature death of its young and gifted author makes the review of this work a melancholy task. The wide reading and linguistic knowledge of Professor Finzi show how much he might have done for Assyrian studies, had his life been spared. The book falls into three divisions. The first consists of an introduction, mostly historical, originally written as an independent production. The statements contained in it cannot always be trusted; and we are sorry to find the insanity of Nebuchadnezzar alleged to be referred to in his standard inscription, and the accuracy of the Assyrian canon impeached by the assumption of a forty-years' break to make way for a Pul whom the inscriptions declare identical with Tiglath-Pileser. The second part of the book is geographical. It will be found useful; but many of the comparisons made by the author, in utter disregard of pho-

netic similarity, will be questioned by most readers. A chapter on ethnology is added, as well as some interesting remarks on home and foreign products. The Accadian name of the horse, however, is not *satra* (which the writer compares with סטרי), but *kurra*. This signifies the animal of the Elamite "mountains," or "the east," and may denote the original home of the Babylonian horse, just as the camel was the beast of "the sea" (*a-abba*), or as *gut*, "the ox," seems connected with Guti on the west.\* The last section of the volume deals with the mythology, and is the most valuable part of the work.

The book must be read with caution, for, learned and suggestive as it is, there is much in it that is hasty, much that is questionable, much that is positively erroneous. This, however, is inevitable in such tentative studies; but we must regret the small regard that is paid to philological laws in the comparison of words. The ethnological views are no doubt right in the main, though we should altogether demur to the early and important presence of an Aryan element in Babylonia, which is assumed throughout. It may seem ungracious to advert to the misprints which abound in almost every page, especially as the forbearance of the reader is requested for them in the preface. They are too numerous, however, not only in the Assyrian, but in Arabic, Hebrew, Greek, Latin, Turkish, German, English, and Italian words, to be passed over, since they materially detract from the value of the volume. We hope that they will be corrected in a future edition by some competent hand. Death has deprived us of the author himself, and, though we trust that there are others in Italy who will take up the work which he has had to lay down, there are none from whom we could have expected more, or whom science could less have afforded to spare.

A. H. SAYCE.

### Contents of the Journals.

*Journal Asiatique*, No. 73.—Was Jerusalem taken by the army of the Calif of Egypt in 1096 or in 1098? [M. Defrémery shows that the former date is inconsistent with Kemal-eddin's narrative of the events which took place in Syria and Palestine between the death of the Sultan Tutuch and the arrival of the Christians before Antioch.]—*Royal Chronicle of Cambodia*, translated, with remarks, by M. F. Garnier.—Topographical and archaeological results of the excavations undertaken at Jerusalem by the Palestine Exploration Fund, by M. Clermont-Ganneau.—The standard of the Assyrian measures fixed by the cuneiform texts [to be continued], by M. Oppert. [An admirable paper.]—A stele of the temple of Herod (discovered by M. Ganneau), by M. J. Derenbourg. [Shows, *inter alia*, that the "fatal consequences" of the intrusion of a pagan spoken of in the latter part of the inscription refer, not to a judicial sentence, but to a kind of nemesis pursuing the offender.]—Weber on the *Saptaçatakam* of Hâla, rev. by G. Garrez.—Letter to the editor, by Mme. Grimblot. [Corrects some misapprehensions, and communicates some English translations of Pali texts by Mr. Gogerly.]—Latest Syriac publications of Dr. Wright, rev. by M. l'abbé Martin. [It seems that there is a MS. of the Acts of St. Philip at Paris, which contains a more ancient text than that which is given by Dr. Wright. The variants, however, are not always very important. The Catalogue of the Syriac MSS. of the British Museum is praised for its exactitude and good classification. A longer notice, supplementary to M. Martin's previous essay on *James of Edessa and the Syriac Vowels*, is given of the fragments of that author's Syriac grammar, printed by Dr. Wright (cf. *Academy*, vol. ii. p. 447), which "are destined to make an epoch in Syriac studies," and "give a much more favourable idea of Jacob's grammatical lucubrations than his letter to George of Sarug, and his treatise on the points have as yet done."]—Note on the chapter of the *Farhang-i-Dichangiri*, relative to dactylography, by S. Guyard. [Adopts Mr. Palmer's explanation of a passage in Firdusi; see *Journal of Philology*, vol. i. No. 4, &c.]

*Archæologia Cambrensis*, October.—Chevalier Lloyd and G. T. C.'s articles are valuable as containing many Welsh proper names. Professor Evan's Studies in Cymric philology have several brilliant points, but

\* It was also called *khar* (*W. A. I.* iii. 68, 2, 64), which may possibly be an Accadian attempt to pronounce *Akharri*, the Semitic name of Phœnicia, or the "West."

the subjects he touches require a more thorough treatment. Ferguson fails to make it clear how he reads the Bridell Ogham. We miss Stephens in this number—neither he nor the editor should pay any attention to the barking of enthusiasts.

*Revue Celtique*, Nos. 3 and 4 in one (December 1871 to August 1872).—Corrected readings from Gaulish coins, by A. de Barthélemy.—An article by Pictet on DRU in the Celtic names of rivers. [Not exhaustive.]—Bulliot shows the *dea Bibracte* to have been a fountain divinity of Mont Beuvray.—D'Arbois de Jubainville's article on the influence of Gaulish on Merovingian Latin is highly interesting: French *mon, ton, son*, owe their special form to Gaulish.—A useful list of O. Cornish names by Stokes.—The *Luxembourg Folio*, re-edited by Rhys, new readings and explanations of the Welsh glosses, curious specimens of pious Latin of the style of Gildas' *Lorica*.—Valuable addenda to Welsh bibliography, by Evans.—Variants of Lagadeuc's *Catholicon*, by Stokes.—Breton proverbs, by Sauvè.—Breton traditions, &c., by Le Men.—The true and falsified versions of Lobineau's history of Brittany contrasted, by Levot.—Among the miscellaneous contents of the volume, D'Arbois de Jubainville points out some of the grave inaccuracies of the *Gram. Celtica* (second edition), which owe their origin to Ebel's not having consulted an improved edition of the Cartulaire de Redon, and taken into account the readings of Gaulish coins.

*Zeitschrift für Deutsche Philologie*, iv. 1.—J. Harczyk: Zu Lamprecht's Alexander. [Shows by a comparison with the old French original that the *Vorau*, and not, as was previously assumed, the *Strassburg MS.*, gives the earlier text.]—Geschichte der deutschen Litteratur, aus W. Wackernagel's Nachlass. [Fragment in continuation of the well-known work; sketches the general characteristics of the seventeenth century.]—J. W. Schulte: Zum Heliand. [The *Præfatio* is a sixteenth-century forgery. Opposes the theory of Behringer that the *Heliand* was based on Tatian's Gospel-harmony.] F. Bauer: Müsiggenger. [A special class of *Bürger*, distinguished from the *Handwerker* by not belonging to any guild.] Schlangen- und Krötenjagen. By the same. [Account of a heathen custom still prevalent in Baden.]—L. Meyer: Zur *Germania* des Tacitus. [Notes on doubtful passages, with criticisms of previous explanations.]
